INDEX TO DECISIONS OF THE COMMISSIONER OF PATENTS AND OF U. S. COURTS IN PATENTS AND TRADE-MARKS.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF U. S. COURTS IN PATENTS AND TRADE-MARKS.

ERRATA.

On page 120, second column, line 30, for "Board of Examiners-in-Chief" read *Examiner of Trade-Marks.*

On page 150, first column, line 9, for "infringements on a prior patent" read *anticipated by a prior application.*

On page 206, first column, place the brief of invention No. 5,287 under No. 5,286, to which it of right belongs.

On page 288, second column, line 17 from bottom, read **136,715.**

On page 289, second column, line 15 from bottom, read **136,715.**

On page 289, second column, line 17 from bottom, read **136,648.**

On page 468, first column, under "Decisions of the Courts," for "U. S. Circuit Court," read *California State Court.*

On page 486, second column, Patent No. 138,436, for "H. W. Range," read *H. W. Regan.*

On page 559, Designs Nos. 6,663, 6,664 omitted. See next number, page 585.

On page 559, Trade-Marks Nos. 1,278, 1,279, 1,280 omitted. See next number, page 586.

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND

DECISIONS OF UNITED STATES COURTS

IN THE MATTER OF

PATENTS AND TRADE-MARKS.

OFFICIAL GAZETTE—January—June—1873.

DIGEST OF DECISIONS.

[The names of Court cases are designated by an asterisk, (*).]

ABANDONED EXPERIMENTS.

Where a model showing a feature not described in the specification was filed with an application, but was afterward declared by the applicant to be a mistake, and another was substituted for it, the first was held to be an abandoned experiment, and no answer to a subsequent application claiming that feature.

[*Decker *vs.* Grote, 65.

(See Novelty, A; Reduction to Practice, 1.)

ABANDONMENT.

(A) In general.
(B) Under the statute.

(A) *In general.*

1. The question whether an invention has been forfeited should be kept entirely distinct from the question whether it has been abandoned.

[Jenkins *vs.* Barney & Berry, 119.

2. If an invention is embodied in a complete working article, and used so far as to demonstrate its practicability, and establish the inventor's right to a patent, he will not lose his right by delaying for nearly two years to file an application.

[Rice *vs.* Winchester, 348.

3. A rejected application is a bar to a new one by the same party for the same invention, unless the second was filed as a renewal or continuance of the first.

[S. B. Sexton, 409.

4. Unavoidable delay while an application for a patent is pending is no ground for imputing abandonment.

[*Jones *et al. vs.* Sewall, administrator, 630.

Mere forbearance to apply for a patent while the inventor is experimenting upon his invention, and perfecting it, and testing its value, affords no ground for presuming that he has abandoned it.

[*Jones *et al. vs.* Sewall, administrator, 630.

(See Appeals, 1; Pleadings and Practice, 12; Practice, B, 1; Prior Inventor, 2; Prior Use, 4.)

(B) *Under the Statute.*

1. An application must be held to be abandoned if it was rejected January 12, 1871, and no further step was taken with it until a request was made for a re-examination, which was not received in the Office till January 13, 1873, although it bore an earlier date.

[Henry H. Blake, 2.

2. If there has been no prosecution of an application for two years it must be pronounced abandoned; nor will this be prevented by any intermediate action of the Office which is merely ministerial, and not interlocutory, or on the merits.

[Freeman Graham, 211.

3. To enter a formal abandonment and request a return of the model will not be regarded as a prosecution of the application, or save it.

[Freeman Graham, 211.

4. Neither will the operation of the statute be prevented because the Office files the formal abandonment and permits the model to be withdrawn.

[Freeman Graham, 211.

5. If an applicant neglects to prosecute his application for two years after it has been rejected, it will be held to have been abandoned unless he shows that the delay was unavoidable.

[W. D. Leavitt, 212.

6. Although the Office afterward concludes that the invention was patentable, this will not alone prevent the operation of the statute.

[W. D. Leavitt, 212.

7. An interference may be declared, however, between it and a subsequent application covering the same invention, in which it may be shown that the delay was unavoidable; but unless the applicant shows this he cannot have a patent, although he prevails on the question of priority.

[W. D. Leavitt, 212.

8. Every invention which was claimed in an application rejected previous to the Act of 1870 must now be considered as abandoned, and, if claimed in a patent issued upon an application filed after the one rejected, must be disclaimed before the patent can be extended.

[S. B. Sexton, 409.

(See Pleadings and Practice, 12; Prior Use 1, 2, 3; Reissues, 6, 7.)

ADVERTISING NOTICES.

(See Extensions, A, 3; Practice, C, 4.)

AMENDMENTS.

1. All necessary amendments of an application should be completed before the claims are passed upon; but if not then made, as, for instance, when new claims are recommended by the Examiners-in-Chief, they should be required as soon as the occasion for them appears.

[Wm. C. Dodge, 179.

2. No amendments should be allowed in original applications which change the character of the invention essentially.

[Wm. C. Dodge, 179.

3. Amendments may be made in the application, although more than two years have elapsed since it was filed; there is no limit as to the time.

[Wm. C. Dodge, 179.

4. An amendment should not be received which introduces into the application a feature not described in the specification as originally filed, and which has not been sworn to by the applicant.

[J. W. Wattles, 291.

(See Abandonment, A, 4; Practice, C, 4.)

APPEALS.

1. An appeal may be taken from the decision of the Commissioner on the question of abandonment to the Supreme Court of the District of Columbia in all cases.

[Jenkins *vs.* Barney and Berry, 119.

2. No appeal can be taken from the decision of the Commissioner upon the question of priority of invention, or upon the question whether the first to conceive of an invention has forfeited it in favor of another.

[Jenkins *vs.* Barney and Berry, 119.

(See Practice, B.)

APPELLATE COURT.

(See Extensions, B, 1, 2.)

ARTICLES OF MANUFACTURE.

1. None of the usual requisites for a patent will be dispensed with because the subject is presented as an article of manufacture.

[S. B. Jerome, 64.

2. A claim for an article of manufacture may be embraced in the same application with other claims.

[Augustus Adams, 150.

3. Although a production is called an "article of manufacture," it must possess the same requisites in order to be patented as other productions, and give the same evidence of invention and novelty.
[Augustus Adams, 150; J. W. Wattles, 291; Horace Beach, 607.

4. A process having been described in a printed publication for producing a fine dry powder containing phosphoric acid, and capable of being used instead of tartaric acid for decomposing an alkaline carbonate in making bread, a claim to such an acid as a new manufacture was held to be void for want of novelty, although the article was produced by a process different from that described.
[*The Rumford Chemical Works *vs.* Lauer, 349.

5. A patent for an article of manufacture cannot be sustained on the ground that it was fabricated by new and improved machinery; it must be a new and improved thing in itself, possessing novelty of its own independent of the devices, processes, or arts by which it was produced.
[*Draper *vs.* Hudson, 354.

ASSIGNEES.

(See Patented Articles, 7, 8, 9, 10.)

ASSIGNMENTS.

1. A conveyance previously executed of an interest in the extension of a patent becomes operative upon the extension being granted, and the title passes thereupon to the purchaser.
[*Gear *et al. vs.* Grosvenor *et al.*, 380.

2. A conveyance of all the grantor's "right, title, and interest in letters patent for the full term for which they are or may be granted," without any reference to the extended term, conveys no interest in it.
[*Gear *et al. vs.* Grosvenor *et al.*, 380.

3. Although the habendum clause contains the words "to the full end of the term for which said letters patent are or may be granted," the extended term will not pass.
[*Gear *et al. vs.* Grosvenor *et al.*, 380.

4. A conveyance of letters patent distinguished from a conveyance of both the letters patent and the invention.
[*Gear *et al. vs.* Grosvenor *et al.*, 380, see note.

CASES COMMENTED UPON.

1. R. W. English, Commissioner's Decisions, 1870, 142.
2. Dutcher Temple Company, Ibid., 248.
[*Smith *vs.* Reynolds and Jacobs, 242.

3. *Ex parte*, Parkinson, Commissioner's Decisions, 1871, 251.
[L. W. Fairchild, 322.

4. Godfrey *vs.* Eames, 1 Wall, 317.
5. *Ex parte*, Shunk, Commissioner's Decisions, 1870, 10.
[S. B. Sexton, 409.

6. The Nicholson Pavement Company *vs.* Jenkins, 1 Official Gazette, 465.
[*Gear *et al. vs.* Grosvenor *et al.*, 380, and note.

7. Roberts *vs.* Heradon, 2 Cliff, 503.
8. Roberts *vs.* Dodge, U. S. Circuit Court, Southern Dist. N. Y.
[*Roberts *vs.* Blake, 268.

9. Rees *vs.* Gould, 2 Official Gazette, 624.
[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

CAVEATOR.

(See Diligence in Prosecuting Inventions; Practice D, 14.)

CAVEATS.

A paper annexed to a caveat is of no authority if the Commissioner of Patents has certified that it forms no part of the caveat.
[*Robertson *vs.* Secombe Manufacturing Company, 412.

CLAIMS.

1. Although a claim in a participial form, for "arranging certain devices," has been held valid in the United States courts, it should be corrected on a reissue, so as to claim the devices themselves.
[Callista E. Cox, 2.

2. Where the essential difference between a patented horse-rake and one previously known consisted in the discharge being at the control of the operator, and this was not specified in the claim, the claim should be amended on a reissue and specify that as the prominent feature, although it had been held valid in the United States courts.
[Callista E. Cox, 2.

3. A claim for the several parts of a tool, in combination with each other and with mechanism, whereby they can be adjusted in relation to each other and made to effect certain purposes, should not be allowed without defining the mechanism, and the words "substantially in the manner herein set forth" are not sufficient for that purpose.
[Fairbanks and Robinson, 65.

4. A claim for all the means by which a cutter-bar may be so attached to a machine that it may at pleasure be suspended at any desired height for reaping, or allowed to follow the undulations of the ground for mowing, is too broad, and is, therefore, invalid.
[*Kirby *vs.* The Dodge and Stephenson Manufacturing Company, 181.

5. A claim for the specific construction and arrangement of the devices by which the registration is effected in a grain-register should not be rejected on reference to a register for stills constructed on the same general principle and accomplishing essentially the same result, but by devices materially different in the construction and arrangement of the parts.
[G. W. Nesmith, 268.

(See Combinations, 7; Patents, 10.)

COLLUSIVE JUDGMENTS.

(See Pleadings and Practice.)

COMBINATIONS.

1. The addition to a combination, which is inoperative and worthless in itself, of an element which renders it practicable and valuable, constitutes a new combination, and is something more than a mere improvement on the old one.
[*Bliss *vs.* Brooklyn, 269.

2. To render a combination patentable two things are requisite—a novel assemblage of parts exhibiting invention, and the co-operation of all the parts in producing a useful result.
[Lynch *et al. vs.* Dryden *et al.*, 407.

3. A split tongue or frame in a walking-cultivator neither modifies the operation of a curved or raised axle therein nor that of two beams hinged to said axle, so as to be moved laterally or vertically independently of each other; neither is its own action modified by them, and there is no legitimate combination between them.
[Lynch *et al. vs.* Dryden *et al.*, 407.

4. There is no legitimate combination between a fire-place stove with divine flues and a suspended magazine, and a claim for such a combination cannot be sustained.
[S. B. Sexton, 409.

5. There is no legitimate combination between a cold-air chamber and a stove having a suspended magazine.
[S. B. Sexton, 409.

6. To place a horse-rake upon a wheeled vehicle in the usual way, and a seeding-box with its customary apparatus, does not present a patentable combination when neither implement modifies the operation of the other.
[Benjamin Morse, 467.

7. A cam-wheel, which is applied on one of the wheels of such a machine to operate the teeth when it is used as a raker, and, when it is used as a seeder, upon the other wheel to vibrate the slide of the plaster-box, may be claimed as a new thing, in combination with either instrument.
[Benjamin Morse, 467.

(See Infringments, 10, 14; Joinder of Inventions.)

COMMISSIONER.

(See Extensions, A, 3; Literary Works, 2.)

CONSTRUCTION OF CLAIMS.

1. Although it was alleged in the specification that the articles to be preserved by the process described were surrounded by a dry atmosphere, and were not allowed to come in contact with the metal partition between them and the freezing-mixture, yet the words "substantially as set forth" do not import those conditions into the claim, nor remove the objection that a process for preserving ice-cream similar in other respects, anticipates the supposed invention, although it does not fulfil those conditions.
[*Piper *vs.* Moore *et al.*, 4.

2. Neither is the claim rendered valid, because the freezing-mixture is contained in tubes running through the articles to be preserved, but surrounds the vessel containing the ice-cream.
[*Piper *vs.* Moore *et al.*, 4.

3. Although the plaintiff may have invented and even described something patentable, and may have supplied a great desideratum, and established a successful commercial business, his claim must be condemned as being too broad.
[*Piper *vs.* Moore *et al.* 4.

4. In a patent for a hat-blocking machine, in which the tip and side crown of the body are stretched as required by placing it upon a former, the upper part of which is composed of ribs between which the tip and side crown are forced and corrugated by rollers on a frame above when the former is raised, and in which the brim is at the same time stretched in like manner by other rollers on the frame, forcing and corrugating it between radiating ribs on the former, the several mechanisms being made adjustable, a claim for "the combination and arrangement of the crown and tip supporting-ribs with the upper series of stretching devices, substantially as described, operating to stretch the tip and side crown of the hat-body between them," &c., is not to be understood as covering broadly the use of the former in connection with the rollers specified, detached from their mechanical combination and arrangement in the machine.
[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

5. Neither is a claim for "the combination and arrangement of the brim-supporting ribs with the lower series of stretching devices, substantially as described, operating to stretch the brim of the hat-body between them," &c., to be so construed.
[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

6. A claim for "the constructing of show tablets in the manner described" is really for the method, and not for the act of constructing, as the language indicates, and should be amended so as to present the true object in direct terms, without any such ambiguity.
[Wm. Brownlee, 212.

7. It is doubtful whether a claim to "the manufacture of the above-described pulverulent phosphoric acid, so that it may be applied in the manner and for the purposes described," is a claim for the article, or for the process of producing it.
[*The Rumford Chemical Works *vs.* Lauer, 349.

8. A claim for "the mixing, in the preparation of farinaceous food, with flour, of a powder or powders, such as described, consisting of ingredients of which phosphoric acid or acid phosphates and alkaline carbonates are the active agents, for the purpose of liberating carbonic acid, as described, when subjected to moisture, or heat, or both," is a claim for preparing self-raising flour by mixing the acid and alkali with flour, and does not include the application of moisture or heat.
[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

9. A claim for "increasing the combustion and also for insuring a more brilliant illumination," by the manner of constructing a stove as specified, is a functional claim.
[S. B. Sexton, 409.

10. A claim for the "adaptation of a fire-place stove" for use with certain other specified elements in it, is a functional claim.
[S. B. Sexton, 409.

11. A claim for making rivets by coiling a flat strip of iron is something more than a claim for a "coil of strip iron."
[J. E. Wooten, 521.

CONSTRUCTION OF SPECIFICATIONS.

1. The expression "names of the months of the year" interpreted to mean the names of the months only, and not as including the name of the year.
[*Robertson *vs.* Secombe Manufacturing Company, 412.

2. A collar specified as having a paper surface imitative of the textile face and fiber of a dressed-linen collar would seem to be the same thing as an embossed collar, when the embossing is explained in the specification to mean a process by which the inequalities upon the surface of a linen collar are reproduced on the surface of a paper collar, and it is made to look like a linen collar.
[Wm. E. Lockwood, 439.

(See Construction of Claims.)

CONSTRUCTION OF STATUTES.

1. The construction of a statute which has been adopted for many years by the officers intrusted with its execution is entitled to great consideration.
[*Gear *et al. vs.* Grosvenor *et al.*, 380.

COPYRIGHTS.

1. Where the title is original and the product of the author's mind, the courts would probably protect it like the other portions of the work.
[*Osgood *et al. vs.* Allen, 124.

2. The title of a book is not necessarily the product of the author's genius, but is usually a mere appendage identifying the work, and in that case is not protected by copyrighting the book.
[*Osgood *et al. vs.* Allen, 124.

3. A person who publishes by way of advertisement an engraving of an article he has on sale cannot by copyrighting it prevent others who have an equal right to sell the article from using a similar engraving in advertising it.
[*Hugh W. Collender *vs.* William H. Griffith, 680.

(See Literary Works, 1.)

CORPORATIONS.

(See Jurisdiction, 1.)

DAMAGES.

1. Where a large quantity of fish is preserved by a patented process, the enhanced price obtained for the fish that are left, in consequence of withdrawing the others from the market, is an incident of trade too remote and indirect to be charged as profits made by infringing the patent.
[*Piper *vs.* Brown *et al.*, 97.

2. The loss incurred during one season in carrying on the infringing business is not to be deducted from the profits made during another season, if there is no connection between the business of one season and that of the other, and the accounts of each have been kept distinct.
[*Piper *vs.* Brown *et al.*, 97.

3. No deduction from the profits the respondents have made by infringing a patent are to be allowed on account of their time and services, nor any commission on their sales when they have paid none.
[*Piper *vs.* Brown *et al.*, 97.

4. If the defendants purchased and used the patented machine without knowledge of the patent, and ceased to use it on being notified of the complainants' rights, they are not liable for exemplary damages.
[*Emerson *et al. vs.* Simms *et al.*, 293.

5. If the owner of a patent has an established fee for a license to work under it, that constitutes the proper measure of damages to be recovered by him for infringing it.
[*Emerson *et al. vs.* Simms *et al.*, 293.

6. The amount of damages to be recovered in an action for an infringement are not to be reduced because the defendants might have used other machines to as good advantage.
[*Emerson *et al. vs.* Simms *et al.*, 293.

(See Pleadings and Practice, 6, 9; Licenses, 2.)

DESIGNS.

1. A name-sign with an imitation gold pen attached to it constitutes a proper subject for a design patent.
[L. W. Fairchild, 323.

2. All description of the mechanical construction of the article represented in a design for which a patent is asked should be eliminated from the specification, as well as all reference to the utility of its purpose.
[L. W. Fairchild, 323.

(See Infringements, 17; Novelty, D; Patents, 3.)

DILIGENCE IN PROSECUTING INVENTIONS.

1. A caveator has a reasonable time in which to mature his invention, and if he has used due diligence he has the right to have his matured invention incorporated into his patent, and to supersede those who have intervened between the date of his first discovery and his taking out his patent.
[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

2. The question of diligence is not an absolute but a relative one, and must be considered in reference to the subject-matter of the experiments.
[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

3. Where the inventor, before applying for a patent, allowed six

years to elapse in a bona fide experiment to test the strength and durability of a wood pavement which was laid upon a frequented road, but without exposing to the public view the mode of its construction: *Held*, that there was no such public use of the invention, or any such dedication or abandonment of it as would avoid a patent for it.

[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

4. Where the inventor of a warlike machine, which he could reduce to practice only by the aid of a national power, and which was of no service except to one engaged in actual hostilities, after endeavoring to induce our Government to take it up, procured a foreign potentate to do so, and reduced it to practice under contract with him, and with the means thus obtained reduced it to practice in this country, using diligence throughout, he was held entitled to date his invention back to the time when he made the drawings for the foreign machine, and he was awarded priority over one who invented afterward.

[Lay *vs.* Ballard, 667.

DUPLICATE INVENTIONS.

(See Patents, 4, 5, 6.)

EMPLOYER AND WORKMAN.

1. An improvement which becomes necessary in the manufacture of a patented implement in order to overcome a difficulty growing out of a departure from the form of the model, and which is introduced into it by the workmen without the knowledge of the patentee, cannot be appropriated by him as his invention.

[*Berdan Fire-Arms Manufacturing Company *vs.* E. Remington & Sons, 689.

2. If such an improvement is embodied by the assignees of the patentee in a reissue, they cannot recover upon it against others who use it.

[*Berdan Fire-Arms Manufacturing Company *vs.* E. Remington & Sons, 688.

EQUIVALENTS.

(See Infringements, 9; Novelty, D, 12.)

ESTOPPEL.

(See Infringements, 12, 13.)

EVIDENCE.

1. Testimony tending to sustain a case in chief will be excluded if taken on the rebuttal, although under an order enlarging the time, but reserving the question of admissibility, if no reason is shown for not taking it before.

[W. W. Lewis, 92.

2. Upon an interference between an application for the registry of a trade-mark and a trade-mark already registered, evidence was adduced to show that the applicant had admitted in conversation that he had not before made use of the trade-mark: *Held*, that it was competent for him to prove, although upon the rebuttal, that he had been in the use of it previous to the conversation.

[Sternberger *vs.* Thalheimer *et al.*, 120.

3. The presumption in favor of a patent is strongly fortified if it has been reissued, and there has been a long acquiescence in the enjoyment of it, and its validity has been sustained when questioned before legal tribunals.

[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

(See General Issue and Notice, 1; Infringements, 4, 5; Joint Inventions, 1; Pleadings and Practice, 1, 3; Practice, C, 1; Priority of Invention, 4.)

EXAMINERS-IN-CHIEF.

1. It is incumbent on the Examiners-in-Chief to call attention to whatever alterations seem to be required, although their suggestions are not authoritative.

[Wm. C. Dodge, 179.

(See Practice, B, 5.)

EXPERIMENTS.

(See Abandonment, A, 4; Prior Use, 2.)

EXTENSIONS.

(A) In general.

(B) As to novelty and utility.

(C) As to value and importance.

(D) As to remuneration.

(E) As to diligence.

(F) As to policy.

(A) *In general.*

1. If an inventor has accepted an assignment of one-half of his patent after it has been reissued by an assignee, he cannot have an extension of the original.

[C. G. Dickenson, 91.

2. The extension of a patent cannot be impeached for fraud in procuring its issue in any collateral proceeding, such as a suit on the patent, but only in one instituted directly for setting it aside.

[*Gear *et al. vs.* Grosvenor *et al.*, 380.

3. It is the filing of a petition for an extension which gives the Commissioner jurisdiction over the proceeding, and not the advertisements required by law; whether they have been duly published it is his province to determine.

[*Gear *et al. vs.* Grosvenor *et al.*, 380.

(See Assignments, 1, 2, 3; Licenses, 1; Patented Articles, 1, 4, 5.)

(B) *As to novelty and utility.*

1. Although a claim was originally allowed by the Appellate Court, yet the patent containing it will not be extended until it is disclaimed, if it is found to be old on references which were not before the court.

[W. W. Lewis, 92.

2. The extension of a patent embracing a combination claim will not be denied on the ground that the elements specified do not co-operate, if the claim was originally allowed by the Appellate Court.

[W. W. Lewis, 92.

3. If the invention covered by a patent is described in an application finally rejected before it was issued, it will not be extended, although both the patent and a reissue of it have been sustained on trials by the court, where the rejected application was not brought to notice.

[Lawton and Bliss, 150.

4. If there is a reasonable doubt whether an old explained drawing anticipates one of the claims in a patent, it should not prevent the extending of the patent.

[H. R. Robbins, 292.

5. A patent for an invention which is described and shown in a previous patent to the same grantee will not be extended.

[A. B. Latta, Administrator, 349.

(See Extensions, C, 6.)

(C) *As to value and importance.*

1. The patentee having done nothing to bring his invention before the public, except to advertise it at the expense of $100, and it consisting merely in constructing the flanch of a railroad-chair with buttresses instead of solid, an extension of the patent was refused, both for want of diligence and for the triviality of the invention.

[W. M. C. Cushman, 29.

2. The extension of a patent refused because the application was sustained only by the affidavits of the petitioners, and also because the invention was never in extensive use, and all demand for it had ceased.

[Behr and Mongel, Administrators, 292.

3. The employment of a known mechanism upon a machine to which it has never been applied before does not possess sufficient merit to entitle a patent for it to an extension, if it did not operate successfully, and never went into use, although others afterward made the mechanism successful by adding devices which gave it a movement radically different.

[A. C. Gallahue, 319.

4. In all successful shoe-pegging machines the point where the awl meets the last is made the center of the arc in which the pivot vibrates that the shoe swings on, and a machine in which that pivot is the center of an arc in which the last swings must be inoperative, and a patent for it is entitled to no favor upon an application for an extension.

[A. C. Gallahue, 319.

5. Where the invention which the patentee is entitled to claim under his patent exceeds in value the amount he has received from it, it will be extended, although all the claims are required to be withdrawn but one, and the limited invention covered by that has been sufficiently remunerated.

[S. B. Sexton, 409.

6. Although there may be doubts as to the patentability of a supposed invention—and there has been a decision of the circuit court against it—yet if an appeal has been taken from the decision and is pending, and if the invention has created and supplied an extensive demand in market, and has been recognized by the public as one of great utility, a patent for it will be extended.

[Wm. E. Lockwood, 439.

(See Extensions, F, 1.)

(D) *As to remuneration.*

1. Less than $5,000 held to be an inadequate remuneration for a meritorious invention.

[W. W. Lewis, 92.

2. Where a much larger sum has been saved to the public by an invention, $21,000 will not be considered an adequate remuneration, and a patent for it will be extended, although that sum has been realized from it.

[H. W. Putnam, 240.

3. A patentee who has licensed others to work his invention is to be charged the same royalty on what the firm to which he belongs has manufactured that his licensees have paid him, and need not account for any further profits made by it.

[S. B. Sexton, 409.

(E) *As to diligence.*

(See Extensions, C, 1.)

(F) *As to policy.*

1. The extension of a patent refused where the inventor had parted with it, retaining only one-fourth of the profits, and where the main reliance for profits was upon suits for infringing the first claim, which specified mechanism new only in the arrangement of the parts without any decided advantage, and the whole had met with little demand, and the evidence of its value was unsatisfactory.

[W. W. Draper, 3.

2. A patent will be extended, although it is doubtful whether the extended term is in the patentee or his wife.

[H. W. Putnam, 240.

3. Although one of the claims in the patent seems to be invalid, yet if a similar claim has been embraced in a subsequent patent granted to other parties, and there are other claims for a valuable invention, the patent will be extended.

[H. R. Robbins, 292.

4. It is a grave objection to the extension of a patent if an interest in it has been assigned upon the purchasers agreeing to employ counsel and to take measures to have it modified so as to cover subsequent improvements.

[Behr and Mongel, administrators, 292.

5. A device which has been superseded in practice by a better one of a different construction must be disclaimed, as well as one which is shown to be old, before a patent which specifies them as the patentee's invention can be extended.

[C. Chambers, 390.

6. A patentee who has allowed his employers to work his invention without compensation, and has agreed that they may do so during the extended term, which will therefore inure mainly for their benefit, if not entirely, should not have his patent extended.

[L. F. Munger, 323.

7. The policy of the law seems to require that a patentee applying for an extension should have an interest in it; but an equitable interest is sufficient, although another holds the legal estate.

[*Gear *et al. vs.* Grosvenor *et al.*, 380.

FOREIGN INVENTIONS.

(See Prior Use.)

FORFEITURE.

(See Abandonment, A and B; Prior Inventor, 2.)

GENERAL ISSUE AND NOTICE.

1. The defendant referred in his answer to a withdrawn application as containing the invention, but did not name the applicant as a witness, nor give his residence; his testimony was objected to on that account when taken, and was struck out, on motion.

[*Decker *vs.* Grote, 65.

2. Where evidence that the invention was not new was taken under objection because no notice was given of it in the answer, it will not be received, although the answer is afterward amended so as to include such a notice.

[*Roberts *vs.* Blake, 268.

3. The defendant will not be permitted, on the hearing, to read depositions showing prior knowledge and use of the thing patented by persons whose names are not given in his answer.

[*Hugh W. Collender *vs.* William H. Griffith, 689.

(See Pleadings and Practice, 11.)

IMPROVEMENTS.

(See Infringements, 15.)

INFRINGEMENT.

1. The plaintiff's patent claimed giving a mill-saw a rocking action by making the upper cross-head move in curved guides without specifying the position in which they were to be placed, but the drawings represented them as perpendicular: *Held*, that the use of curved guides, although they were inclined, was an infringement.

[*Hamilton *vs.* Ives & Green, 30.

2. A cotton-bale tie, consisting of a plate with a square central opening, around one end of which one end of the band is looped, and having a slit in one of the adjacent sides through which a loop in the other end of the band is slipped onto the opposite end, is an infringement of a patent for a tie having two bars across such a central opening, around which the two ends of the band are looped, and pass by each other and under the bars at the ends, the claim being for an oblique slit in one of the end bars, through which the last end of the band is slipped under the bar sidewise.

[*McComb *vs.* Beard, 33.

3. The plaintiff's patent being for a cord covered with cloth, and attached thereby sidewise to a horizontal corner in the face of a billiard-cushion, where it received the impact of the ball at about its center, and repelled it horizontally with the additional elasticity of the cushion, (which it thus preserved from wear,) and with reduced friction, as well as with greater accuracy of direction: *Held*, that a cord embedded in the edge of the rubber forming the face of the cushion, and covered by a thin layer of it, was an infringement.

[*Decker *vs.* Grote, 65.

4. Evidence of using a patented article will sustain a charge of infringing by "making and using" it.

[*The Locomotive-Engine Safety-Truck Co. *vs.* The Erie Railway Co., 93.

5. The master having reported that the defendants could not preserve fish in their apparatus as constructed without using the complainant's process, they thereupon altered the apparatus in that particular; but on their refusing to permit the master to inspect the chamber where they preserved fish afterward, he found them guilty of still infringing the patent, and his report to that effect was confirmed.

[*Piper *vs.* Brown *et al.*, 97.

6. A patent for an apparatus for making extracts from tan-bark by means of exhaust steam, which claims, in combination, an exhaust-steam pipe, a leach, and intermediate boxes in which the steam is condensed, and is also free to expand so as to avoid back pressure on the piston, is not infringed by a similar apparatus in which there is no exhaust-pipe nor provision for avoiding back pressure, but the steam is taken directly from the boiler.

[*Bridge *vs.* Brown *et al.*, 121.

7. In a patent for a hat-blocking machine, in which the body is stretched by being placed on a former composed of ribs, between which the body is forced and corrugated by rollers on a frame above as the former is raised, and in which patent it is suggested that fixed round-edged surfaces may be substituted for the rollers, a claim for the ribs and rollers by which the crown and tip are formed is infringed by a machine in which ribs are substituted for the rollers, although the rollers act on one part only at a time, while the ribs continue to operate during the whole process upon every part upon which they have begun to act, and other advantages result.

[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

8. And a claim in the same patent for the ribs and rollers by which the brim is stretched and shaped in like manner, is infringed by a machine in which ribs are substituted for rollers, although the ribs of the former under the brim are expanded, as it is raised like those of an umbrella.

[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

9. A machine having no supplemental frame, but instead thereof a drag-bar, by which the cutter-bar is sustained against the pressure of the crop, while its height is adjusted and secured by chains by which it is suspended, is no infringement of a harvester in which the cutter-bar is attached to a frame which is hinged to the wheel-frame, but bolted to it at any desired height.

[*Kirby *vs.* The Dodge & Stephenson Manufacturing Co., 181.

10. The use of a patented combination, which is inoperative and worthless in itself, in connection with a new element which renders it practical and useful, cannot be punished as an infringement.

[*Bliss *vs.* Brooklyn, 269.

11. A patent for a chemical process is not infringed by a different process, although the same article is produced by it.
[*The Rumford Chemical Works *vs.* Lauer, 349.

12. The owners of a patent are estopped from prosecuting those who have worked the invention under a license from a third party, relying upon their admissions that he had an interest in it.
[*Gear *et al. vs.* Grosvenor *et al.*, 360.

13. But not from prosecuting those who have used the invention after learning that the owners claimed an exclusive right to it.
[*Gear *et al. vs.* Grosvenor *et al.*, 360.

14. Unless every element embraced in a combination is used, or some equivalent for it, a patent for it is not infringed.
[*Brown *vs.* Hinkley & Cole, 384.

15. Patented improvements upon an earlier patented invention cannot be used in connection with it without the consent of its owners.
[*The American Nicholson Pavement Co. *vs.* The City of Elizabeth, 522.

16. A patent for a refrigerator divided by a vertical partition through which there are apertures at the top and bottom, and having in the top of one division an ice-box with a perforated bottom through which the air descends and is cooled, and rises through the other division, is infringed by a refrigerator of a similar construction, except that there was no partition but the side of the ice-box, which did not extend through the side of the refrigerator.
[*Roberts *vs.* Ryer, 551.

17. If a patent for a design covers the ornamentation shown in it, it is no infringement to use the principal figure without the ornamentation.
[*Hugh W. Collender *vs.* William H. Griffith, 689.

(See Combinations, 1; Damages; Jurisdiction, 1, 2; Trade-Mark, 17.)

INJUNCTIONS.

1. An injunction against infringing a patent will be granted only when the patentee shows either that he has recovered a judgment on it in a suit, or that he has used and enjoyed his right under it so long as to warrant the presumption that the public have acquiesced in it.
[*Brown vs. Hinkley and Cole, 384.

2. An injunction against infringing refused when the patent had been reissued within two months, with a claim to a combination not set up in the original, and of which there had been no use or enjoyment.
[*Brown *vs.* Hinkley and Cole, 384.

(See Jurisdiction, 1, 2; Pleadings and Practice.)

INTERFERENCES.

1. If an application is filed for a mechanical patent, and if a design for which a patent has been granted can be produced only by the construction described in the application, an interference should be declared between the application and the patent.
[Collender *vs.* Griffith, 91.

(See Practice, D.)

INVENTION AND SKILL.

1. It is questionable whether merely advancing the fire-pot of a stove further into a room in order to heat it more effectually should be regarded as an invention.
[H. R. Robbins, 292.

2. When, in the manufacture of Berdan's fire-arm, the hinge of the breech-piece was raised so high as to bring its upper surface above the line of the bore and thus interfere with the insertion of the cartridge, it is questionable whether it is a patentable invention to cut away the obstructing portion of the hinge and thus give that part of it a curved surface.
[*Berdan Fire-Arms Manufacturing Company *vs.* E. Remington & Son, 668.

(See Reissues, 1.)

JOINDER OF INVENTIONS.

1. A patent for a mechanism, so constructed that it may be used for several different purposes by having different devices connected with it, each adapted to one of those purposes, may include also a claim for the principal mechanism in combination with any one of the adjunct devices.
[J. F. Shepard, 522.

2. If a peculiar construction of the adjunct device is necessary to effect the combination it may also be claimed in the same patent.
[J. F. Shepard, 522.

3. But a patent will not be granted for a combination of the principal mechanism with all the adjunct devices with which it may be thus connected, the combination with each device constituting a distinct machine and requiring a separate patent.
[J. F. Shepard, 522.

JOINT INVENTIONS.

1. Where, in answer to an application by A, reference is made to a rejected joint application by A and B, the affidavits of both that B had no part in making the invention are not sufficient to remove the objection.
[J. B. Welton, 440.

2. An interference should be declared in such a case, and the question settled on testimony or on formal concessions in accordance with the rules.
[J. B. Welton, 440.

(See Patents, 4, 5, 6.

JURISDICTION.

1. If an infringement by use is established the complainant is entitled to an account for all infringements by making, using, or vending, and to an injunction against making, using, or vending throughout the district over which the court has jurisdiction.
[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

2. Although a corporation has a legal existence throughout the entire State, it can be prosecuted for an infringement only in the court of the district in which it was perpetrated, and can be enjoined by that court from infringing only in that district; relief against infringements in another district of the State can be obtained only in the court of that district.
[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

3. A circuit court of the United States cannot, through service of process in its district on an officer of a corporation created under the laws of another State, acquire jurisdiction over the corporation.
[*Decker *vs.* The New York Belting and Packing Company, 441.

4. A corporation does not waive the objection in consequence of appearing by attorney and pleading to the jurisdiction of the court.
[*Decker *vs.* The New York Belting and Packing Company, 441.

(See Extensions, A, 3; Literary Works, 2.

LICENSES.

1. An exclusive privilege of making and selling the patented article expires with the original term of the patent, unless it is otherwise stipulated.
[*Mitchell *et al. vs.* Hawley, 241.

2. The recovery in an action for an infringement of the amount of a license fee as damages gives the defendants the right to work the invention during the life of the patent.
[*Emerson *et al. vs.* Simms *et al.*, 293.

LITERARY WORKS.

1. If the public have been deceived, or are liable to be deceived into buying the works of one author as those of another, in consequence of giving them a title which the latter has been accustomed to use, the courts will interpose as in the case of trade-marks.
[*Osgood *et al. vs.* Allen, 124.

2. The United States courts will not exercise jurisdiction in such a case, however, unless the parties belong to different States.
[*Osgood *et al. vs.* Allen, 124.

NEW TRIALS.

(See Rehearings; Practice, D, 2.)

NOVELTY.

(A) In general.

(B) In the application.

(C) In the form.

(D) In the structure or process.

(A) *In general.*

1. The existence twenty years before of a single machine similar to that described in a patent, which was abandoned directly, and which appears to have been impracticable, will not invalidate the patent.
[*Blake *vs.* Rawson, 122.

2. It seems that the merit of novelty should not be denied to a device upon reference to a mere drawing, not accompanied by any explanation.
[H. R. Robbins, 292.

3. The right of an inventor to a patent will not be prejudiced by the existence of the invention abroad, unless it was patented or described in some printed publication before he originated it.
[Carr *vs.* Davids, 440.

4. A saw-blade with a socket of a spiral form for a tooth, in combination with a tooth of a corresponding form, cannot be considered novel if the drawings of a previous patent show a saw-blade and tooth so nearly resembling them that they cannot be distinguished except by a mathematical test.
[J. H. Sperry, 467.

(See Abandoned Experiments; Articles of Manufacture; Extensions, B, 3; Prior Use, 1.)

(B) *In the application.*

1. A claim for preserving fish or other articles in a close chamber by means of a freezing-mixture having no contact with the atmosphere of the preserving-chamber, "substantially as set forth," is answered by a process in previous use for preserving ice-cream by the means and under the conditions specified.
[*Piper *vs.* Moore *et al.*, 4.

2. Pasting engravings upon glass having been commonly practiced, it is a mere double use to prepare clock-faces by such means.
[S. B. Jerome, 64.

3. To cast the handle of a screw-driver upon the tang of the blade does not possess the merit of novelty, since it is common to attach the handle of knives and other implements in the same way.
[L. C. Clark, 239.

4. It is also common to cast the handle in such cases hollow, and a screw-driver so constructed is not new as an "article of manufacture."
[L. C. Clark, 239.

5. Bourdon's steam-gages have usually been tested by applying weights to them while under steam-pressure, and there is no novelty in testing them by weights while they are not under pressure.
[B. B. Keyes, 268.

6. If any one has the right to use a certain fabric he is not to be restricted in his right by a patent for employing it in a way that does not require invention.
[J. W. Wattles, 291.

7. If a device which has been used before in a stove can be applied to one of another kind without difficulty, a claim for the new application should receive no countenance.
[H. R. Robbins, 292.

8. A heating-stove containing a suspended magazine and a grate of larger dimensions under it, with a free space above for burning the gases, is patentable, although a furnace of the same structure employed for heating boilers, and surrounded with water, has been known before.
[S. B. Sexton, 409.

(See Novelty, D, 4.)

(C) *In the form.*

1. It being shown that tables with the sides beveled inward from the top have been known before, a patent is void which claims the design of a billiard-table thus constructed, in order that the player may advance his foot further under it.
[*Hugh W. Collender *vs.* William H. Griffith, 689.

2. It is a mere question of judgment, not invention, how far the bevel shall be carried, and a patent for the design of a billiard-table is not rendered valid because a much deeper bevel is shown in it than has been used in other tables.
[*Hugh W. Collender *vs.* William H. Griffith, 689.

(D) *In the structure or process.*

1. To transfer the friction-rollers from the driving-wheel in a harvester to the pitman-bar which it actuates does not warrant a patent.
[T. Plumleigh, 29.

2. A patent for a cord covered with cloth, and attached thereby sidewise to a horizontal corner in the face of a billiard-cushion, where it receives the impact of the ball at its center, and repels it horizontally, is valid, although a claim was previously made in a withdrawn application for a cord placed in a groove in the upper surface of the cushion, where it would be raised by the ball and would hold it down.
[*Decker *vs.* Grote, 65.

3. The patent was also held valid in the face of a prior patent for a billiard-cushion in which thin strips of horn were inserted in a slit cut in the rubber pad, and used as a facing for it, the cushion not yielding horizontally, nor repelling the ball in a horizontal direction.
[*Decker *vs.* Grote, 65.

4. The operation of a railway truck, (of which there is one at each end of a railway car,) and in which the bolster is suspended by swinging links from brackets on the frame, so that the car and truck may move laterally upon each other, is unlike that of a leading-truck of the same construction in a locomotive-engine in which the driving-wheels are incapable of any such lateral movement; and the previous use of such a truck in a railway car will not invalidate a patent for one in a locomotive-engine.
[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

5. Such a truck, in which the lateral movement is limited by springs, is no answer to a patent for one in which the movement is limited by making the links diverge from each other downward.
[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

6. Neither is the leading truck of a locomotive-engine in which a lateral movement of the truck and engine upon each other is effected by other devices than links, and the engine does not swivel upon the king-bolt in the bolster as does the patented engine.
[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

7. Blake's stone-crusher, consisting of two jaws nearly vertical, but inclining from each other upward, and by a reciprocating movement of one to and from the other crushing the stone as it falls till the fragments pass out at the bottom, is novel, although a previous machine crushed and ground stone between a horizontal cylinder oscillating on its axis, and the sides of an eccentric basin approximating to the periphery of the cylinder at the bottom.
[*Blake *vs.* Rawson, 122.

8. A patent for an automatic hat-blocking machine in which the tip and side crown of the body are stretched as required by placing the body upon a former the upper part of which is formed of ribs, between which the tip and side crown are forced and corrugated by rollers on a frame above as the former is raised, and in which the brim is stretched at the same time in like manner by other rollers on the frame forcing and corrugating it between radiating ribs on the former, the several mechanisms being made concentric and adjustable, is not void for want of novelty because such devices had been made and used before in separate parts, except that, instead of the rollers, ribs were used, and those for the brim closed downward like those of an umbrella, the whole being manipulated by hand, and there being no provision for adjusting the parts or making them operate concentrically.
[*Eickemeyer Hat-Blocking Machine Company *vs.* Pearce *et al.*, 150.

9. Stops for receiving the paper in a paper-folding machine preparatory to a second operation after it has been folded once, and which require a lateral adjustment in order to receive signatures of varying sizes, constitute no objection to the novelty of a curved or angular stop which will receive signatures of any size without being specially adapted to them.
[C. Chambers, 396.

10. To place upon a photometer a plate having two scales beside each other engraved upon it, one indicating the pressure of the gas, the other the degree of light, so that they can be readily compared, involves so much novelty that the originator should have his right to it sanctioned.
[W. W. Goodwin, 347.

11. A patent for varying the proportions in which the ingredients have been used in a chemical mixture cannot be sustained if the process remains substantially the same.
[*The Rumford Chemical Works *vs.* Lauer, 349.

12. A claim for preparing self-raising flour by mixing with flour phosphoric acid, or acid phosphates and alkaline carbonates, without including the application of moisture or heat, is invalid if a patent has been granted before for preparing self-raising flour by the same means, except that tartaric acid was used in lieu of phosphoric acid or acid phosphates.
[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

13. To use phosphoric acid in lieu of tartaric acid in such a process, is a mere substitution of one chemical equivalent for another.
[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

14. A claim for "the use of phosphoric acid or acid phosphates, when employed with alkaline carbonates, as a substitute for ferment or leaven in the preparation of farinaceous food," is valid, notwithstanding tartaric acid has been used before with alkaline carbonates for the same purpose, since it could not be known beforehand whether phosphoric acid could be used for such a purpose with safety to health.
[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

15. There being no difficulty in the way of substituting a split tongue for a straight one in a walking cultivator, and no invention required to make it, such substitution was held not patentable.
[Lynch *et al. vs.* Dryden *et al.* 407.

16. Where a patent for a stamp for printing dates describes three type-wheels bearing the names of months and figures, there is no invention in adding another bearing the year, or in placing the year upon one of the other wheels.

[*Robertson *vs.* Secombe Manufacturing Company, 412.

17. A stamp with a handle, by which it is held when used, and fixed type, as well as wheels bearing type which may be changed at will, is novel and patentable, notwithstanding the previous existence of apparatus having no handle but with fixed type and type-bearing wheels upon which the article to be stamped was pressed; as well as of type-wheels for numbering and lettering, and type-forms for printing the name of a post-office or other matter; also type-forms for dating and printing, combined with type-wheels for numbering, which were automatically changed at every operation.

[*Robertson *vs.* Secombe Manufacturing Company, 412.

17. A patent for preserving green corn by severing the kernels from the cob, so that the juices will be liberated, and then boiling the kernels and juices together in sealed cans, is valid, although a patent has been previously granted abroad for preserving corn by boiling it in vessels, without specifying whether the kernels are to be separated from the cob, or whether they are to be broken or whole.

[*Jones *et al. vs.* Sewell, Administrator, 630.

(See Claims, 5; Combinations, 3; Construction of Claims, 1, 2; Infringements; Novelty, 3, 4, 8; Patentability, 2.)

OFFICIAL CERTIFICATE.

1. Where a public officer is authorized to grant a patent upon proof of compliance with certain prerequisites which is satisfactory to him, his issuing of the patent is *prima facie* evidence that they have been complied with, and no recitals to that effect are necessary in the grant.

[*Gear *et al. vs.* Grosvenor *et al.*, 348.

(See Caveats; Trade-Marks, 7, 8, 9, 10.)

PATENTABILITY.

1. A patent may be granted for a mechanism so constructed that it may be used for several purposes by having different devices connected with it, each adapted to one of those purposes.

[J. F. Shepard, 522.

2. A patent for a combination which proves inoperative and worthless is void.

[*Bliss *vs.* Brooklyn, 269.

(See Articles of Manufacture, 3; Construction of Claims, 3.)

PATENTED ARTICLES.

1. A patentee may stipulate in licensing another to sell the patented article that his licensee shall not sell it to be used beyond the original term of the patent; and a purchaser from such licensee will be guilty of infringing if he use it during the extended term.

[*Mitchell *vs.* Hawley, 241.

2. A purchaser from such a licensee is entitled to no notice of the limited extent of his authority; he should inquire into it, and if he neglects to do so he purchases at his own risk.

[*Mitchell *et al. vs.* Hawley, 241.

3. Where such a licensee gave the purchaser a license to use the patented article in terms sufficient to put him upon inquiry, it was held that he was entitled to no further notice of the limited authority of the licensee.

[*Mitchell *et al. vs.* Hawley, 241.

4. When a patentee sells the patented article he parts with all his control over it, and the purchaser may treat it like any other property, and use it as long as it lasts without liability to the patentee, although the original term of the patent has expired and it has been extended.

[*Mitchell *et al. vs.* Hawley, 241.

5. The purchaser has the same right in the article if the person from whom he obtained it was authorized by the patentee, without any conditions, to make and sell or make and use it.

[*Mitchell *et al. vs.* Hawley, 241.

6. A patented article purchased from one who has unqualified authority to sell it becomes like other property, and the purchaser may use it as he pleases without any liability under the patent.

[*McKay *vs.* Wooster *et al.*, 441.

7. Where the owner of a patent sells the entire interest in it for a specified territory, and the assignee sells the patented article therein, the purchaser is not restricted in his use of it to that territory, neither is he liable to the patentee for using it in the territory reserved.

[*McKay *vs.* Wooster *et al.*, 441.

8. Neither is he liable to one to whom the right for the territory reserved is sold by an assignment subsequent to the other.

[*McKay *vs.* Wooster *et al.*, 441.

9. Doubted whether an assignee of a territorial right under a patent could sell the patented article so as to authorise the use of it in a territory, the whole right in which had been sold to another before he purchased.

[*McKay *vs.* Wooster *et al.*, 441.

10. Doubted what the effect would be of a clause in a deed of a territorial right, expressly restricting the right to sell for use so that only sales for use in the territory shall be made under it.

[*McKay *vs.* Wooster *et al.*, 441.

PATENTS.

1. A patent for a truck when employed in a locomotive-engine which had been used before in cars is not void because it purports by its title to be for "an improvement in trucks for locomotive-engines."

[*The Locomotive-Engine Safety-Truck Company *vs.* The Erie Railway Company, 93.

2. When an alteration in an article is intended to change its functions, or improve its operation, or effect a new result, it may be the subject of a mechanical patent.

[T. B. Ogleaby, 211.

3. If the alteration is calculated to give it a better appearance merely, it can be protected only by a design patent.

[T. B. Ogleaby, 211.

4. Claims for different structures having no connection or co-operation with each other, and formed by different processes, cannot be allowed in the same application, although they belong to the same class and are of the same kind.

[H. M. Stow, 322.

5. A wooden pavement in which the blocks are kept separate by cords, and one in which the spaces are formed by cords, and, after they are removed, are filled in with sand, &c., and one formed of thin blocks with spaces between the blocks in each row, and not between the rows, cannot be considered in the same application, nor the processes by which the first two are made.

[H. M. Stow, 322.

6. Each kind of wooden pavement may be embraced in the same application with the process for making it.

[H. M. Stow, 322.

7. Although an inventor has obtained a patent for a process, he may have another for the product.

[*Jones *et al. vs.* Sewall, administrator, 630.

8. There cannot be more than one valid patent for an invention, nor can the grantee of a patent sustain an action upon another patent for the same invention issued afterward.

[*Jones *et al. vs.* Sewall, administrator, 630.

9. Separate patents for separate and distinct parts of the same invention are nevertheless valid.

[*Jones *et al. vs.* Sewall, administrator, 630.

10. A claim for a machine and a claim for the product of a machine will not be allowed in the same application. Each must be presented in a separate application for a distinct patent.

[Murray and Wuterich, 659.

(See Evidence, 3.)

PLEADINGS AND PRACTICE.

1. The finding of a master as to the construction of infringing apparatus will not be set aside for error in fact, if it is founded on personal inspection made with the consent of the parties, as well as upon the evidence of others, which is not all of it reported.

[*Piper *vs.* Brown *et al.*, 97.

2. The master's refusal to receive further evidence after having submitted to the counsel the draft of his report upon a hearing, approved.

[*Piper *vs.* Brown *et al.*, 97.

3. Upon a motion for an injunction the merits of the patent will be considered anew, although it has been sustained on similar hearings before other judges, if it is alleged that new facts are in proof, and that the objections to the patent were not properly presented on those hearings.

[*Blake *vs.* Rawson, 122.

4. It was referred to a master to ascertain whether the public had been, or were liable to be, deceived into the purchase of a literary work in consequence of its bearing a title which had been used by another author.

[*Osgood *et al. vs.* Brown, 124.

5. The parties having agreed that if the amendment were allowed the testimony might be received as if taken under the amended answer, it was admitted upon terms that the defendant should tax no cost up to the hearing.

[*Roberts *vs.* Blake, 868.

6. Under the prayer for general relief the complainants in a suit in equity for the infringement of a patent may recover damages without a special prayer for them.

[*Emerson *et al. vs.* Simms *et al.*, 293.

7. A compromise was made between the parties to a suit for infringing a patent, in pursuance of which a decree for the complainants was entered in the Circuit Court, and affirmed on appeal in the Supreme Court, and they paid the defendant's counsel as well as their own. Upon these facts being shown to the Supreme Court the degree of affirmance was vacated, the appeal dismissed, and the mandate which had been issued to the Circuit Court was recalled.

[*Gardner *vs.* The Goodyear Dental Vulcanite Co., *et al.*, 295.

8. The act of 1837, section 9, which allows a recovery upon such claims of a patent as are valid, though other claims are not, does not apply to inventions which are not specified in distinct claims.

[*The Rumford Chemical Works *vs.* Lauer, 349.

9. Whether a patent for the use of an article has been infringed by the sale of it in connection with the use of it by the purchasers, is a question to be determined upon the evidence in taking the account of damages.

[*The Rumford Chemical Works *vs.* Hecker *et al.*, 349.

10. Where the defendant in a bill for infringement had deceased, and there was no prayer for discovery against his executor, nor proof of infringement by him, the title to relief by discovery and injunction was held to have failed, and, as incident to that, the right to an account also, and the bill was dismissed without costs.

[*Draper *vs.* Hudson, 354.

11. Objections being made to evidence on the ground that notice of it was not given in the answer, leave to amend the answer was moved for at the hearing, and the amendments were allowed as of the time when the answer was filed.

[*Roberts *vs.* Ryer, 551.

12. The defense that the patentee had allowed his invention to be in public use or on sale for two years before he applied for a patent is distinct from the defense that he had abandoned it to the public, and should not be blended with it in the same pleading.

[*Jones *et al. vs.* Sewall, administrator, 630.

(See General Issue and Notice; Injunctions; Jurisdiction, 4.)

PRACTICE.

(A) In general.
(B) On appeals.
(C) In extensions.
(D) In interferences.

(A) *In general.*

1. Although it may be proper sometimes to reject a claim upon the strength of a mere dictum, it is advisable only where there is no other ground for such action.

[Fairbanks and Robinson, 65.

2. Claims filed after an appeal to the Examiners-in-Chief can be considered only when sanctioned by the Commissioner.

[Wm. C. Dodge, 179.

3. Strictures upon the practice of giving numerous references bearing more or less directly on the case, instead of citing those only which are pertinent to the claim.

[Wm. Brownlee, 212.

4. Embracing in an argument reflections upon the Examiner, and insinuations against his motives, emphatically condemned.

[C. Chambers, 320.

(See Abandonment, B, 1; Amendments, 1, 2, 3; Articles of Manufacture, 2; Joint Inventions, 1.)

(B) *On appeals.*

1. If the party who is found by the Examiner of Interferences to be the prior inventor is refused a patent on the ground that he has abandoned the invention in consequence of its having been in public use or on sale for two years before he filed his application, an appeal by him brings up the question of abandonment only, and not that of priority of invention.

[Jenkins *vs.* Barney and Berry, 119.

2. If the adverse party desires to have the decision on the question of priority revised, he must appeal from it.

[Jenkins *vs.* Barney and Berry, 119.

3. If the Examiner of Interferences decides that the party who first conceived of the invention has, by his negligence in prosecuting it, forfeited his right to it in favor of his opponent who had reduced it to practice before him, an appeal by him brings up both questions.

[Jenkins *vs.* Barney and Berry, 119.

4. Where the decision of the Examiner of Interferences left it doubtful whether he held that the party who was the prior inventor as he found, had abandoned the invention, or had forfeited it in favor of his competitor, the case was remanded in order that he should make his decision explicit on that point.

[Jenkins *vs.* Barney and Berry, 119.

5. The decision of the Examiners-in-Chief sustaining the action of the Examiner affirmed, although founded upon a reference not given by him, but described in an application which he had cited.

[Wm. Brownlee, 212.

(See Practice, A, 2.)

(C) *In extensions.*

1. There is no more reason in extension cases than in others for relaxing the rules for taking testimony, which are founded on principles of law and practice.

[W. W. Lewis, 92.

2. Although the evidence does not give all the information as to the value of the invention and the diligence of the patentee which the rules call for, yet if it gives enough to satisfy the Commissioner, and there is no serious opposition on those points, the patent will be extended.

[H. R. Robbins, 292.

3. An application for an extension refused because the sworn statement and testimony, consisting mostly of copies of what was filed upon an application for the extension of another patent, were highly defective, and failed to furnish the information required.

[A. B. Latta, Administrator, 349.

4. Publishing notice of the day appointed for the hearing of an application for an extension three times, the first of which is sixty days previous, seems to be a compliance with the law which requires it to be published for sixty days previous.

[*Gear *et al. vs.* Grosvenor *et al.*, 380.

5. Claims in a reissued patent which embody, though only by way of reference, a feature not shown in the application for the original, must be disclaimed before the patent will be extended.

[S. B. Sexton, 409.

6. Claims which are clearly functional, and claims to illegitimate combinations, must be withdrawn, as well as claims to old devices, before a patent will be extended.

[S. B. Sexton, 409.

7. Where a claim which is allowed to remain on extending a patent defines the invention by reference to another which is required to be withdrawn, the latter will be understood to remain valid so far as it is connected with and embodied in the other.

[S. B. Sexton, 409.

(See Abandonment, B, 8; Extensions, C, 2, 5; Extensions, F, 5.)

(D) *In interferences.*

1. It is doubtful whether a party can be adjudged to have abandoned his invention to the public and at the same time to have forfeited it for want of diligence, in which case the adverse party might be held entitled to a patent as the prior inventor.

[Jenkins *vs.* Barney and Berry, 119.

2. After the determination of an interference a new one should not be declared without the order of the Commissioner between the successful application and applications filed by the other parties which were not included in the first interference, but which claim a feature shown but not claimed in the successful application.

[Hovey *vs.* Muller *et al.*, 149.

3. The successful party should have his patent issued to him on disclaiming the feature in question as being embraced in another application filed by him, if such is the case.

[Hovey *vs.* Muller *et al.*, 149.

4. An interference will be dissolved if it appears that some of the claims set up by the parties are void, and there is no conflict between the remainder.

[Evans *vs.* Bussell and Vose, 180.

5. If the party to an interference who was the last to make application neither files a preliminary statement nor takes any testimony he may be considered as out of the case.

[Evans *vs.* Bussell and Vose, 180.

6. The question whether an alleged invention is new should be settled before an interference is declared, but if it is subsequently made a distinct issue the Office is bound to consider it.

[Wood *vs.* Morris, 239.

7. An interference should be declared between an application for a mechanical patent and a design patent which shows the alleged invention, although the applicant has a prior design patent showing the same.

[Collender *vs.* Griffith, 267.

8. If the designs embraced in the two patents are so dissimilar as not to be in conflict, it is unnecessary to include the earlier patent in the interference.

[Collender *vs.* Griffith, 267.

9. The burden of proof is on the applicant for the mechanical

patent, notwithstanding his design patent first shows the invention; but he may have the benefit of it by introducing it in evidence.

[Collender *vs.* Griffith, 247.

10. The proceedings upon an interference should be suspended whenever it is ascertained that the supposed invention is not patentable.

[Lynch *et al. vs.* Dryden *et al.*, 407.

11. Where there is reason to presume that the question of patentability has not been definitely settled, the Examiner of Interferences may dissolve the interference and remand the case to the Examiner in charge for further consideration.

[Lynch *et al. vs.* Dryden *et al.*, 407.

12. Rule 59 explained.

[Lynch *et al. vs.* Dryden *et al.*, 407.

13. The Examiner of Interferences has authority to dissolve an interference whenever he finds that the supposed invention in controversy is not patentable.

[Lynch *et al. vs.* Dryden *et al.*, 407.

14. Where it is shown that a caveator failed to receive the notice sent him by the Office of a conflicting application, and he consequently filed no counter application, and a patent was granted to his competitor without an interference, he is not to be prejudiced thereby, but will be treated as if both parties were applicants.

[Frevert *vs.* Gahr, 660.

(See Abandonment, A, 1; Abandonment, B, 7; Interferences; Joint Inventions, 2; Practice, B, 1, 2, 3, 4; Rehearings.

PRIOR INVENTOR.

1. He is the prior inventor, and is entitled to the patent for an invention, who first embodies it in a complete, practical, working utensil, and exhibits it to the public, though another afterward reduces it to practice and applies for a patent before him.

[Rice *vs.* Winchester, 348.

2. After such an embodiment of his invention, his delay in applying for a patent can operate only as an abandonment to the public; it is not forfeited thereby in favor of a subsequent inventor.

[Rice *vs.* Winchester, 348.

PRIOR USE.

1. Previous knowledge of an invention abroad is no defence against a patent, unless it was described in some printed publication so clearly as to enable others to put it in practice.

[*Jones *et al. vs.* Sewall, Administrator, 630.

2. The use of an invention by the author for the purposes of experiment, though continued for more than two years, will not prejudice his right to a patent.

[*Jones *et al. vs.* Sewall, Administrator, 630.

3. Neither will the sale or use of it by others without his consent.

[*Jones *et al. vs.* Sewall, Administrator, 630.

4. Where an invention has, through the acts of the inventor, come into public use beyond his control, his right to it is forfeited beyond recall.

[*Jones *et al. vs.* Sewall, 630.

PRIORITY OF INVENTION.

1. An inventor who has fully shown his improvement in a model, but takes no further steps toward reducing it to practice for five years, and does not apply for a patent for more than a year after he learns that another has put it in practice before him, forfeits his right to a patent, and the latter will be held the prior inventor.

[Pattee *vs.* Russell, 181.

2. The title of the latter is not prejudiced because the other filed his application before him.

[Pattee *vs.* Russell, 181.

3. Priority will be awarded to the party who originated the invention before his competitor suggested it to him, and who reduced it to actual practice and took out a patent for it, of all which his competitor had full knowledge but interposed no claim to it, and did not apply for a patent for nearly two years after the other patent was granted, although he originated the invention before the patentee, but did nothing toward perfecting it.

[Vinton *vs.* Pierce, 629.

4. A patent is *prima facie* evidence of the patentees having made the invention when the application was filed.

[*Jones *et al. vs.* Sewall, Administrator, 630.

If a patentee wishes to show that he made the invention previous to filing his application, he must prove, as against another patent for it, that he had reduced it to practice in an operative machine.

[*Jones *et al. vs.* Sewall, Administrator, 630.

6. The party who first reduced an invention to practice and forthwith obtained a patent for it will be held the prior inventor, although his opponent had conceived it before and had described it, but took no measures toward reducing it to practice, (except that he had assisted the other in doing so,) nor toward obtaining a patent till long afterward, and especially if he had made no claim to the invention meanwhile, but when challenged with claiming it had denied the charge.

[Frevert *vs.* Gahr, 660.

(See Diligence in Reduction to Practice; Reduction to Practice.)

PROCESS.

(See Patents, 7.)

PROPERTY IN PATENTED ARTICLES.

(See Patented Articles.)

REDUCTION TO PRACTICE.

1. Where one made several devices and proposed constructing a machine embodying them, but had no definite idea of the method of doing it, and, after repeated experiments with the devices, laid them aside until they were brought forward to defeat a patent for such a machine, the whole was considered as an abandoned experiment, which did not affect the validity of the patent.

[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

2. Making a model is not such a reduction of an invention to practice as will give a title to it against other inventors of it if it is neglected afterward.

Pattee *vs.* Russell, 181.

3. Where one of two competitors for a patent was the first to conceive the invention, and to embody, reveal, and test it by experiment, and to apply for a patent, he was held to have completed the invention, and priority was awarded to him as against one who first conceived of it after it had been so tested, although he was the first to put it in actual use.

Little *vs.* Stephenson, 379.

4. Too much weight must not be attached to the employment of an invention in actual use. It is important only when it is necessary to establish the date of its being actually completed.

Little *vs.* Stephenson, 379.

(See Diligence in Reduction to Practice; Prior Inventor; Priority of Inventions, 5.)

REHEARINGS.

1. After the time designated for taking testimony in an interference has expired, the case will be opened for taking further testimony upon the affidavit of one of the parties that he has newly discovered such evidence as shows that the supposed invention had been in previous use.

Wood *vs.* Morris, 239.

2. Although the new testimony is cumulative merely, evidence to the same effect having been given before, yet upon the question of novelty the case will be opened, but not on the question of priority.

Wood *vs.* Morris, 239.

(See Practice, D, 2.)

REISSUES.

1. The plaintiff's original patent described a cord attached sidewise to a corner in the face of a billiard-cushion in order to protect it, but made no mention of a groove in which to place the cord; the use of such a groove to receive the cord and save the cloth from wear was held to be a mere mechanical adaptation, having no relation to the invention; and a reissue of the patent describing the cord as wholly or partially embedded in the groove was held valid.

[*Decker *vs.* Grote, 65.

2. The validity of a reissued patent is not affected because it contains a claim not made in the original; neither is that circumstance any evidence that the patentee did not make the invention claimed.

[*Eickemeyer Hat-Blocking Machine Co. *vs.* Pearce *et al.*, 150.

3. Where the original patent was for a solid India-rubber car-spring, but the specification suggested that it might be hollow, yet neither the drawings nor model showed such a feature, a claim for a hollow spring in a reissue is void.

[Evans *vs.* Bussell & Vose, 180.

4. A claim in a reissued patent for a plain rubber spring without grooves is void if the original application contained no mention of such a form, but described only a grooved spring.

Evans *vs.* Bussell & Vose, 180.

5. Byron Dinsmore's patent of February 10, 1852, described a harvester having but one wheel hinged to the frame which carried the cutter-bar, but rigidly bolted to it, though capable of adjustment at different heights: *Held* that a reissue of it with the following claim was void: "Hanging the driving-wheel in a supplemental frame which is hinged at one end to the main frame, while its opposite end may be adjusted and secured at various heights, or be left free, as desired, whereby the cutting apparatus may be held at any desired height for reaping, or be left free to accommodate itself to the ground for mowing;" both because the original application contained no indication of the change which adapted the machine to mowing, although it consists merely in removing the bolts by which the height of the wheel-frame was adjusted and secured, and because the alteration was not devised till after the original patent was issued.

[*Kirby *vs.* The Dodge & Stephenson Manufacturing Co. *et al.*, 181.

6. Applications for a reissue do not come within the purview of section 32 of the act of 1870.

[N. H. Galusha, 321.

7. Neglecting to take any steps in prosecuting an application for a reissue for two years after the last action of the Office upon it, does not work an abandonment of it.

[N. H. Galusha, 321.

8. After a patent has been reissued the patentee has no rights or remedies under the original patent; he has only such as arise under and after the reissue.

[*Brown *vs.* Hinkley and Cole, 384.

9. The abuse of the privilege of reissuing patents by expanding their scope condemned.

[S. B. Sexton, 409.

10. The law providing for a division of a patent upon a reissue applies only where there are distinct inventions to be embodied in them, not to the mere application of the same invention in different machines of the same generic class.

[S. B. Sexton, 409.

11. It may be doubted whether a patent should be divided on a reissue so as embrace in one division the employment of an invention in a fire-place stove and in another the use of it in an outstanding stove.

[S. B. Sexton, 409.

12. In an original patent for a stamp containing several type-wheels for dates, the suggestion that they might bear any suitable letters or figures warrants describing in a reissue a wheel bearing the date of the year, though it was not otherwise alluded to in the original.

[*Robertson *vs.* Secombe Manufacturing Company, 412.

13. It is within the scope of a reissue that it contain a fuller description of the state of the art than the original, as well as of the nature of the improvements made by the patentee, and the advantages attained through them.

[*Robertson *vs.* Secombe Manufacturing Company, 412.

14. Where the original specification in a patent for a stamp averred one object to be to stamp the day and month, a reissue may describe one object to be "dating" and "printing dates."

[*Robertson *vs.* Secombe Manufacturing Company, 412.

15. A patent for a process may be reissued with a claim for a part only of the process, if the same result may be obtained without employing the steps omitted from the claim.

[J. E. Wooten, 521.

16. A patent for making tubular rivets by coiling a flat strip of iron and welding it may be reissued with a claim for coiling it alone, if the welding is found unnecessary.

[J. E. Wooten, 521.

17. A mere suggestion in the specification that the article monopolized may be used in a certain way does not warrant the insertion in a reissue of a claim for a combination of the article with the mechanisms in connection with which it is to be so used.

[J. E. Wooten, 521.

18. When a reissue has been granted it is to be presumed that the Commissioner has found all the conditions fulfilled on which he is authorized to issue it, and that it is for the same invention that is described in the original patent.

[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

19. No such presumption can prevail if it appears on the face of the patent that the Commissioner has exceeded his authority, or if there has been fraud or collusion between him and the parties.

[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

20. A reissue is valid although it claims only one of two modes of construction specified in the original patent.

[*The American Nicholson Pavement Company *vs.* The City of Elizabeth, 522.

21. If the original patent for a refrigerator with a vertical partition, through which there are apertures at the top and bottom which admit of a current of the inclosed air through them down one division and up the other, shows such partition placed in the center only, and gives no intimation of any other position for it, there is no warrant for inserting in a reissue the suggestion that one of the divisions need be no wider than is necessary for the passage of the upward current.

[*Roberts *vs.* Rider, 551.

(See Claims, 1, 2.)

SPECIFICATIONS.

1. A patent is not invalid because the theory upon which the applicant's machine operates, as set forth in his specification, is erroneous, provided the machine will accomplish that of which it is represented to be capable.

[*Hamilton *vs.* Ives and Green, 30.

2. If the scales which indicate the pressure of the gas and the degree of light in a photometer are denominated "indexes" in the specification and claim of an application, the error is such as justifies its being rejected.

W. W. Goodwin, 347.

(See Articles of Manufacture, 2; Designs, 2; Construction of Specifications.)

SUBJECTS OF PATENTS.

(See Patents.)

TRADE-MARKS.

1. The name under which a patented article has been sold during the lifetime of the patent becomes public property when it expires, as well as the article, and cannot be appropriated as a trade-mark.

[C. E. Richardson *et al.*, 190.

2. Persons who employ a word in a tentative way on five or six occasions, and take no further steps with it for three months, do not gain a title to it as a trade-mark against one who has meanwhile adopted it and put in general use.

[Sternberger *vs.* Thalheimer *et al.*, 190.

3. Neither will the latter lose his right to it because the others procure it to be registered.

[Sternberger *vs.* Thalheimer *et al.*, 190.

4. After a patent has expired to include the word "Patent" in a trade-mark for the article is calculated to mislead the public, and the registration of it will not be allowed.

[C. E. Richardson *et al.*, 190.

5. The words "A. Richardson's Patent Union Leather-Splitting Machine," under which the article protected has been sold during the lifetime of the patent, cannot be appropriated as a trade-mark for it after the patent has expired; neither can they be though the word "Patent" is omitted.

[C. E. Richardson *et al.*, 190.

6. The word "Union" having been attached to a patented article during the lifetime of the patent, has acquired a distinctive meaning, has lost its character as an arbitrary symbol, and cannot be registered as a trade-mark.

[C. E. Richardson *et al.*, 190.

7. The patent act of 1870 does not authorize the Commissioner to issue any Letters Patent for a trade-mark, nor certificate containing a grant of one.

[*Smith *vs.* Reynolds *et al.*, 213.

8. Copies certified by him of any trade-mark filed in the Patent Office, and of the date when it was received as recorded, and of the statement filed therewith in pursuance of section 77, are made evidence under section 80, and he has no authority under the act to issue any other certificate in relation to trade-marks.

[*Smith *vs.* Reynolds *et al.*, 213.

9. If the copies certified by him do not include such a declaration as is required under the seventh clause in section 77 of the act, the defect is fatal.

[*Smith *vs.* Reynolds *et al.*, 213.

10. An averment in the Commissioner's certificate that the parties have complied with the act and that their trade-mark will remain in force thirty years, does not warrant the presumption that the required declaration was filed or remedy the defect.

[*Smith *vs.* Reynolds *et al.*, 213.

11. It is for the court alone to determine from the copies of the Patent Office records whether the declaration required by the 77th section has been duly filed, and is in conformity with the law.

[*Smith *vs.* Reynolds *et al.*, 213.

12. Causing the name of the firm which claims a trade-mark and its place of business to be recorded in the Patent Office is a sufficient compliance with the first requirement of section 77 of the act of 1870, without specifying the names of those who compose the firm.

[*Smith *vs.* Reynolds & Jacobs, 214.

13. To designate "paints" as the goods for which a trade-mark is to be appropriated is sufficient without a more particular description.

[*Smith *vs.* Reynolds & Jacobs, 214.

14. The figure of a crown used as a trade-mark for paints may indicate to buyers and dealers by association the origin and ownership of the same, and is of itself a lawful trade-mark.

[*Smith *vs.* Reynolds & Jacobs, 214.

15. Registering a figure as a trade-mark for paints in general, without any restriction as to the kind, gives no title to it if it has been previously used in connection with words or other figures as a trade-mark for any particular kind of paint.

[*Smith *vs.* Reynolds & Jacobs, 214.

16. A trade-mark must stand or fall as a whole, and the registry of one cannot be sustained for a part of it, as in case of a patent, if it is void as to the rest.

[*Smith *vs.* Reynolds & Jacobs, 214.

17. To use a man's own name is not actionable, though it forms part of another man's trade-mark, provided he does not do it in such a manner as to deceive the public, and uses no other material part of the trade-mark.

[*Hardy *et al. vs.* Cutter *et al.*, 468.

18. The plaintiffs were entitled to the exclusive use of certain trade-marks which included the expressions "J. H. Cutter" and "Bourbon Whisky," and under which they sold an article of high reputation known as "Cutter Whisky;" yet the defendants were held not liable for selling whisky with labels unlike the plaintiffs in all other respects, but inscribed with the words "J. F. Cutter," (which was the name of one of the defendants,) "son of the late J. H. Cutter," and "Bourbon Whisky."

[*Hardy *et al. vs.* Cutter *et al.*, 468.

19. Descriptive phrases which are in common use, like "Bourbon whisky," cannot be appropriated as a trade-mark.

[*Hardy *et al. vs.* Cutter *et al.*, 468.

20. Registration refused to the phrase "American Sardines," intended to be placed as a trade-mark on cases resembling sardine-boxes, but containing another kind of fish, it being calculated to deceive the public.

[The American Sardine Co., 495.

21. The phrase "American Sardines" is not one coined for the intended use, but would be the proper name of such fish if they should be found in this country, and ought not, therefore, to be appropriated as a trade-mark.

[The American Sardine Co., 495.

UNITED STATES COURTS.

1. The decision of the United States Supreme Court upon a question of law, and sustaining a patent, is entitled to deference, but is not to be followed where the facts appear to be different.

[*Kirby *vs.* The Dodge & Stephenson Manufacturing Co., 181.

2. A claim which has been sustained by a United States court on full consideration of the same references as are before the Commissioner will not be questioned by him, though he may have doubts as to its validity.

[H. W. Putnam, 240.

3. Points which did not engage the particular attention of the court, though they were before it, and were embraced in the decision, may be considered anew by the Commissioner, if good reasons are shown.

[H. W. Putnam, 240.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 3.—NO. 1. TUESDAY, JANUARY 7, 1873. PRICE { $6,00 per year—single. $5,00 " " in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO THE PUBLIC.

With this number commences the second year, the third volume, of the OFFICIAL GAZETTE. The experience of the past year has been useful and satisfactory; *useful* as being suggestive of possible improvements which have been from time to time adopted or are yet in contemplation; *satisfactory*, as the publication and its method have met such general approval.

As has been said in another part of this number, the GAZETTE at first consisted of text without illustrations: the addition pleased everybody. The exigencies of the case, however, compelled the condensation of the drawings of each week into eight pages, be the number of patents many or few. The average number of patents per week, original and reissued, was about 218; the numbers per week varied from 170 to 273. This variation permitted more latitude of illustration when the numbers ran low, and required a corresponding condensation and close packing when the high numbers occurred. The reasons were sufficient for establishing a definite and unvarying number of pages in the illustrated portion of each week, but need not be explained here.

In regard to the general question of *sufficiency of illustration* in the GAZETTE, two remarks may be made:

In the majority of cases the amount illustrated is admittedly ample, the invention turning upon a single point requiring but a very moderate area for full development.

In other cases the invention is of such a character as to render it out of the question to give such an illustration as will make it plain in all its parts. Some inventions—such, for instance, as type-setting and printing-machines—have from 10 to 25 sheets of drawings. In such cases the brief of invention in the text and the selected figure in the illustrated portion are but indications, not sufficient to put the reader in full possession of the whole invention, but sufficient to show him the line of direction of the invention, and to determine whether it be worth while to order a full copy of the patent specification and drawings, which will cost 25 cents, or if 20 copies be taken at one time but 10 cents per copy.

The Office has now three distinct publications, each of which has its characteristics:

1. The copies of patents, specifications, and drawings of full size. Single copies 25 cents, or 10 cents per patent when not less than 20 are ordered at one time, or to subscribers for a class.

2. A volume published monthly containing the whole of the specifications of the month's patents unabbreviated, and with the whole of the drawings, reduced so as to go four on a quarto page.

3. The GAZETTE, published weekly, in which the full text of the claims of the patents of the week are given, together with a brief statement in each case to help out the descriptions; also, a selected portion of the drawing, sufficient in most instances to answer the purpose of an inquirer, but failing in a few cases, for reasons sufficiently explained above.

The experience of the past year has been to confirm the general wisdom of the method adopted, and no change is likely to be made. The publication is believed to fulfill with reasonable precision the requirements of cleanness, clearness, correctness, promptness, and punctuality.

The cleanness is both artistic and mechanical. The Commissioner acknowledges with pleasure his indebtedness, in both respects, to the *American Photo-Lithographic Company*, of New York, who have, by means of Mr OSBORNE'S process, so deftly, rapidly, and punctually reproduced from the original drawings and printed the illustrations, and to the Hon. A. M. CLAPP, *Superintendent of Public Printing*, under whose care the text portion has been so tastefully and carefully executed.

The *clearness* and *correctness*—considering the large number of subjects, the multitude of operations, and the short time admissible in the preparation of each number—are believed to be satisfactory.

The *promptness* has been such that the GAZETTE has been sent to subscribers the same week that the patents have been mailed.

The *punctuality* is evinced by the fact that, although at the mercy of cloudy days and poor drying-days, and workmen at great distances apart, yet the GAZETTE varies but a day or two at the most in the day of mailing.

OFFICIAL GAZETTE.

NOTICE.

The law which established the "OFFICIAL GAZETTE OF THE PATENT OFFICE" authorized its sale to subscribers for "not less than $5.00 per annum." The first volume—from January to June (inclusive) 1872—as originally published—consisted of text alone, and did not contain any illustrations. The second volume has been issued throughout with eight pages weekly of illustrations, and shortly after its commencement the illustrations were made for volume 1 and forwarded to the subscribers, already furnished with the text. Succeeding volumes will be illustrated in a similar manner.

The price of $5.00 was put upon the publication when it consisted of text alone, and no addition (unexpectedly to subscribers) was made to the price when the illustrations were added. It is not designed to issue the GAZETTE at a price which will cover the actual cost, and therefore an extension of the list of subscribers will not make the journal a paying institution as between the subscribers and the Office, but the indirect benefits are great and immediate: To inventors in promptly circulating accounts of their inventions; to the public in stimulating invention; to the Office in increasing the number of applications presented.

All these things are fully manifest in the correspondence that has occurred in relation to the paper during the year of its publication, and it is believed that, although the subscription price does not cover the cost, no better mode of using a small part of the accumulated fund derived from the fees paid by inventors can be found.

As the Commissioner is limited by the act of Congress to the price of $5.00 as the minimum for subscription, and no fund or authority is given for advertising the OFFICIAL GAZETTE, it has been deemed advisable to offer a premium for subscription in clubs, which can only be done by selling to clubs at the subscription price, and charging single subscribers somewhat more, thus inducing intending or renewing subscribers to persuade others to join them in subscription.

The price of the OFFICIAL GAZETTE for the year 1873 will therefore be $6.00 to single subscribers and $5.00 to newsdealers, the book trade, and others who subscribe in clubs of not less than five, the names to be sent on at one time, though the paper will be mailed weekly, free of postage, to the separate addresses if desired.

As some subscriptions have already been received for the year 1873, the change of subscription price will only be made as to subscriptions received on and after the first of February, 1873.

M. D. LEGGETT,
Commissioner.

COMMISSIONER'S DECISIONS.

HENRY H. BLAKE.—*Reference.*

[*In the matter of the application of Henry H. Blake for Letters Patent for an alleged* IMPROVEMENT IN INDEX-LAMPS.—*Decided January* 16, 1873.]

FORFEITED APPLICATIONS.

In estimating the "two years after action," (section 32, law of 1870,) within which a case may be prosecuted, the "notice" is held to be the date of mailing of the last letter of rejection, and the request for further action *must be filed in the Patent Office* before the expiration of two years from the said notice.

The apparent date of execution of an instrument of writing can not be accepted as bringing the instrument within the provision of the law.

THACHER, *Acting Commissioner:*

The Principal Examiner submits the following statement in this case and asks for instruction:

"This case was rejected a second time, and on reference first given, January 12, 1871. Applicant now presents a request for further action by the Examiner. This request is dated at Pittsburg, Pa., on the 9th instant, but it did not reach this Office until the 13th instant, and was laid before the Examiner on the 14th instant.

"Under section 32 of law of 1870, and rule 39, Ed., August, 1870, the Examiner has apparently no jurisdiction over the case, and consequently refers the whole matter to the Commissioner for direction and instruction.

"L. DRANE,
"*Examiner.*"

To this request the following answer is made:

The *apparent* date of an instrument of writing may or may not be correct. It may be wholly deceptive and *intended* to mislead.

The only date that can be regarded by the Office as entirely reliable is that of filing, as indicated by the official stamp upon the paper. As this was more than two years subsequent to the last official action on the application, and no explanation of the delay is offered, the Commissioner is left by the law without discretion in the matter. The application must be treated as abandoned under the provisions of section 32, act of 1870.

CALISTA E. COX.—*Reissue.*

[*Appeal from the Principal Examiner in the matter of the application of Calista E. Cox, executrix, &c., for the reissue in four divisions of Letters Patent No.* 7,813, *for* "IMPROVEMENT IN HORSE-RAKES," *granted to Harvey W. Sabin, December* 3, 1850.—*Decided January* 10, 1873.]

PRACTICE UNDER RULE 44—REISSUES.

That a claim has been sustained in the United States Courts does not remove it from the operation of the law, which requires that "every such case shall be subject to revision and restriction in the same manner as original applications are."

A participial claim to "arranging" devices, instead of to the devices themselves, having been granted under a former more lax practice, should—although in the mean time it has been sustained by the courts—be made to conform to the present practice in revising the application for reissue.

THACHER, *Acting Commissioner:*

The Examiner objects to certain portions of the description in several divisions and to some of the claims, the objections, as a whole, including all the divisions of the reissue application.

The first objection is to portions of the description which imply that the rake-teeth may rise independently of each other. The Examiner holds that the model and drawings preclude such an operation. In this opinion I do not concur. The model is so frail that very little reliance can be placed upon it in showing what was the construction originally intended. But the drawing attached to the original patent shows clearly that there is a certain amount of independent motion allowed to each tooth. There is a considerable space between the cleaning-bar and the pressure-bar which permits this movement, and if the pressure-bar is brought down so as to rest upon the tooth-bar, the lifting-bar is removed so far from the front extension of the rake-teeth that the same freedom of motion will be permitted before the lifting-bar is brought again in contact with the front ends of the teeth, so as to lift them all simultaneously. This independent motion, although limited, would probably be sufficient in a full-sized machine for all practical purposes, and in my opinion the description is fully warranted by the original record.

Objection is also made to the description representing the shipping-lever as articulated about the axles as a center of motion. This description is undoubtedly somewhat ambiguous. The fulcrum of the lever, it is true, is attached to the thills, but the thills articulate about the axle, and the construction of the lever is such that it moves with the thills. With this explanation, therefore, the description is correct, and to avoid all misunderstanding an explanatory clause to this effect should be inserted.

The objection to the claim in Division A appears to be well founded. The essential difference between Sabin's rake and that of Smith, described in English patent No. 10,241, is that in the former the discharge is under the control of the operator, but in the latter this desirable feature is entirely wanting. This point of difference and its importance are fully set forth in the recent decision of the Commissioner granting a second extension of the Sabin patent. The Examiner rightly requires the claim to be amended so as to set forth this difference. It is true the claim has been sustained by a United States Court, but undoubtedly it was saved by construing it in connection with the statement of invention, in which the difference in construction mentioned is distinctly stated. The claim should be amended as required by the Examiner.

In Division B the fifth claim is objected to as covering a construction not existing in the original machine. In one view of the case this is true. The clearer does not have an independent articulation about the axle, but it is attached to the rear extension of the thills, which do have a certain amount of motion about the axle, even while the rake is in operation, which oscillating motion is necessarily communicated to the clearer. Perhaps the claim should be amended so as to conform more nearly to this construction and operation.

The remaining objection is to the form of all the claims in Division B and the claim in Division D. This objection does not go to the subject-matter of these claims, but simply to the form, which is participial, and makes the claims stand for the act of arranging devices instead of the devices themselves. Under the present practice of the Office this objection is well taken; and the practice has been so well established by numerous decisions published heretofore, that there is no necessity for further discussion here. It has been urged, however, that the practice should be relaxed in this instance, as the claims, or at least some of them, have been sustained by United States Courts. I do not think this position is tenable. The law makes no exception whatever in reissue applications. Section 51 of 1870, relating to reissues, provides that "the specification and claim in every such case shall be subject to revision and restriction in the same manner as original applications are." Now the claims have been sustained by construing them as claims for devices, and although under a former more lax practice they were granted without objection, now that they are before the Office again, in an application for reissue, they are undoubtedly subject to revision, and should be amended to conform to the decisions of the courts and the present practice of the Office. This objection of the Examiner is therefore sustained.

The application is remanded to the Principal Examiner for further action in accordance with this decision.

WM. W. DRAPER.—*Extension.*

[*In the matter of the application of Wm. W. Draper, for extension of patent No.* 22,635, *granted January* 18, 1859, *and reissued April* 11, 1871, *No.* 4,333, *for* TOOL HANDLE OR HOLDER.—*Decided January* 17, 1873.]

Case of an application for extension of a patent of limited value, considering the state of the art at the date of the patent.

The case being complicated by a late reissue of doubtful validity; and farther, by the limited interest retained by inventor in the expected extension.

THACHER, *Acting Commissioner:*

This case, although very well presented before the Office, does not appear to be a strong one in the essential facts requisite to warrant the grant of an extension. The invention consists of a tool-holder intended to center, clamp, and secure the tang of a file or other tool, and is adapted to apply to tools of varying sizes.

On the end of an ordinary handle or stock is secured a metallic ferrule, provided with a hollow screw upon its internal surface. A hollow nut, carrying a pair of hinged wedge-shaped clamps or jaws, engages with this screw, and being turned to the right or left, by means of the file or other tool placed between the clamps, causes them to open or close upon the tool as desired. Behind the open space in the hollow nut is a centering-block with a conical centering-groove, which receives the end of the file when inserted between the jaws. This block rests against one end of a coiled spring inclosed within the handle, which causes it to advance and recede with the nut.

The claims are as follows:

1. The combination with the holder, embracing the parts A D of the loose, wedge-shaped jaws F F and the revolving nut E for operating the jaws, substantially as described, and for the purposes set forth and specified.

2. The combination with the holder, embraced in the parts A D, jaws F F, and revolving nut E of the centering-block C and spring B, substantially as described and specified.

The Examiner calls attention to the patent of D. H. Chamberlain, of February 7, 1854, which confirms his remark that "At the time of granting the original patent, sought to be extended in this application, it was not new to construct a handle or tool holder with tapering jaws, which were made to close upon the tang of the tool by means of a screw-nut or sleeve."

The precise construction of the device under consideration is not found in this patent, but the principle of operation is the same, and the difference of construction, so far as the clamping is concerned, is only that of the relative arrangement of like parts, which in one case is the reverse of that in the other. It is impossible for me to conclude from inspection, or from the evidence produced, that this invention is practically inferior to Draper's. Indeed, if their order of date had been reversed it would, I think, have exhibited quite as much ground for being regarded as an improvement over Draper's device as his does for being regarded as an improvement over it. The truth is, the arrangement of the parts in the respective devices being different each has its peculiar advantages, and each with properly-limited claims was undoubtedly patentable.

But upon inspection the value and importance of Draper's invention, considered with reference to the state of the art at the date of the patent, is not very apparent, and it is not made apparent by the testimony upon this point. The evidence manifestly does not proceed from an informed stand-point as to the state of the art. It does not make allowance for Chamberlain's invention, and it is not corroborated by the extent of the actual manufacture and sale of the veritable device in question. It does not appear that the Draper tool-holder proper has ever been made and placed upon the market to any considerable extent. The ascertained value of the invention is not made out, or if it is it appears to be only nominal.

Besides, the first claim, which has only recently been obtained by reissue at the hands of assignees, is, to say the least, of doubtful validity. In view of Chamberlain's patent, I think it should have been more definitely limited to the precise construction shown. As it stands I believe it is calculated to mislead the public as to its just scope.

There is no objection to the second claim in this connection, except upon the point of the value and importance of the subject-matter it embraces. Upon that point I regard it as questionable, and it has not been strongly contended for.

I am not favorably impressed with the contract by which it is proposed that the inventor is to obtain the adequate remuneration which it is alleged he has thus far failed to receive. The assignees or licensees engage to supply the market, but there is no evidence that there is any demand in the market for this particular tool-holder. On the other hand, there is evidence that the main reliance for profit is upon suits for infringement of the "principle" of construction embraced in the first claim, which would avail the inventor nothing. Twenty-five per cent. of the net profits of manufacture, after deducting the expenses of extension, do not, under the circumstances of this case, promise the inventor adequate compensation.

Altogether the case does not commend itself to my mind, upon the evidence adduced, as a proper one, having due regard to the intent of the law and the interests of the public, to warrant the grant of the extension sought, and it is therefore refused.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

ENOCH PIPER *vs.* GEORGE T. MOON *et al.*

[*In Equity.—Before Blatchford, Judge.—December Term*, 1872.]

PATENT OF ENOCH PIPER—METHOD OF PRESERVING FISH.

The claim of the Piper patent for "Preserving fish or other articles in a close chamber, by means of a freezing mixture having no contact with the atmosphere of the preserving-chamber, substantially as set forth," may cover the process when the chamber is used both to so freeze and so preserve the article, and also when it is used only to so freeze the article, or when it is used only to so preserve the article.

By the words "substantially as set forth," it is not required that there shall be no contact between the article undergoing preservation and the metal interposed between such article and the freezing-mixture.

The subject of the claim is anticipated by the prior process of preserving frozen ice-cream in a close chamber, by means of a freezing-mixture which had no contact with the atmosphere of the chamber.

That the freezing-mixture surrounded the vessel containing the frozen cream, instead of being in tubes running through such vessel, did not alter the nature of the process.

The claim pronounced invalid, notwithstanding the patentee, by the use of a process practiced before, may have supplied a great desideratum and have established a business that is commercially profitable.

A suit in equity brought in the Southern District of New York, under the patent of Enoch Piper, of March 19, 1861, for "An Improvement in Method of Preserving Fish." The cause came on for final hearing before Judge Blatchford, and was decided upon the consideration of the single question of the invalidity of the patent as raised by the answer to the bill.

[*M. B. Andrus* and *Browne & Holmes*, for complainant.
W. C. Witter and *George Gifford*, for defendants.]

BLATCHFORD, *J.*

The patent to the plaintiff, granted March 19, 1861, is for an "Improvement in Method of Preserving Fish." The specification says:

The nature of my invention consists in a method of preserving fish and other articles, by placing them within a chamber, and cooling the latter by means of a freezing-mixture, so applied that no communication shall exist between the interior of the preserving-chamber and that of the vessels in which the freezing-mixture is placed. The most important application which I propose to make of my invention is for preserving salmon, which are only taken in large quantities in high northern latitudes, in summer, so remote from our large cities that they can be made available in a fresh state only by artificial congelation. Hitherto the only method in use for preserving this kind of fish in a fresh state has been to pack them with crushed ice in barrels or boxes. This method, however, owing to the melting of the ice, and the consequent moistening of the fish, fails to preserve them fresh and good for more than a month at most; whereas, by my new method and treatment, they can be kept as fresh and sweet as when first caught, and for any desirable length of time, even for years. I do not profess to have invented the means of producing artificial congelation, nor to have discovered the fact that no decay takes place in animal substances so long as they are kept a few degrees below the freezing-point of water; but the practical application of these to the art of preserving fish and meats, as above described, is a new and very valuable improvement.

The apparatus for freezing the fish and keeping them in a frozen state may be constructed in various ways and of different shapes. The apparatus shown in the drawing, however, will suffice to illustrate the principle and mode of operation.

The specification then describes, with reference to the drawings, a method of freezing the fish by laying them in small quantities on a rack, in a box of wood or other suitable material, which is surrounded by a packing of charcoal or other suitable non-conducting material. Metallic pans filled with a freezing-mixture, such as salt and ice, are then set over the fish and the cover is shut upon them. The specification proceeds:

The temperature in the box soon falls to ten or fifteen degrees below the freezing-point of water, and, in about twenty-four hours, the mixture being changed once in twelve hours, the fish will be frozen completely through. After being thus frozen the fish or meats may, if desired, be covered with a coating of ice by immersing them a few times in ice-cold water, or by applying the water with a brush or swab several times, forming a coat of about one-eighth of an inch in thickness. To prevent the ice from cracking off, I then apply to the fish, when they are to be kept an unusual length of time, a cover of cloth, and, in the same manner, cover the cloth with another coating of ice, or they may be coated with gum arabic, India rubber, gutta-percha, tin foil, or any suitable substance, either in combination or separately, that will effectually exclude the air and prevent the juices from escaping by evaporation, thereby preserving the same plump and fresh appearance as when first frozen.

The specification then goes on to say that the fish are then packed closely together in a large preserving-box, which is inclosed in a still larger box, the space between the two boxes being filled with charcoal or other non-conducting material to exclude the heat; that metallic tubes pass through the inner box, which are open at the upper ends for the introduction of a freezing-mixture, the lower extremities being formed with flanges screwed to the bottom of the box; that a small tube leads from the bottom of each tube to the outside of the outer box to draw off the brine from the tubes; that the tubes project at the top through the cover of the outer box when it is shut down, so that they may be charged with the freezing-mixture without opening the box; and that, by keeping the tubes filled with the mixture of salt and ice, the temperature of the preserving-chamber can be maintained for any length of time below the freezing-point, and fish surrounded by the dry and freezing atmosphere will be preserved as fresh and good as when first caught, and for a much longer period than by any other method. The patentee adds:

I do not desire to be understood as confining myself to the use of the specific apparatus above described, nor to the use of either or both the preliminary processes of freezing and coating, but I have described the mode of operation which, by experience, I have found best for preserving the most delicate varieties of fish. In the case of meats it is not necessary to resort to the coating process, especially beef and pork preserved for salt packing in warm weather, which can be done by this treatment with no more loss than in the best winter weather, while the cold pickle or brine of the dissolving salt and ice is ready made, and may be drawn off as required to pickle the barrels after packing the meats, &c.

The claim is in these words:

Preserving fish or other articles in a close chamber, by means of a freezing-mixture having no contact with the atmosphere of the preserving-chamber, substantially as set forth.

In this specification, as is usually the case, the patentee first sets forth the nature of his invention by stating in what it consists; and we expect to find that the claim corresponds with such statement of the nature of the invention, whatever may be set forth in the intervening descriptive part of the specification. The claim in the present case is not so worded as not to cover a process or sub-process less than the entire process or series of processes described in the specification.

The statement of the nature of the invention says, that it consists in a method of "preserving" fish and other articles by placing them within a chamber, and cooling the latter by means of a freezing-mixture, so applied that no communication shall exist between the interior of the "preserving" chamber and that of the vessels in which the freezing-mixture is placed. The claim is for "preserving" fish or other articles in a close chamber by means of a freezing mixture, having no contact with the atmosphere of the "preserving" chamber, substantially as set forth. What is the meaning of the word "preserving," as so used? and what is the chamber that is so referred to as the "preserving" chamber? Manifestly, the word refers to the process to which the article is subjected in the chamber, between the interior of which and the interior of the vessels containing the freezing-mixture there is no communication. That chamber is the preserving-chamber. That chamber may be used to freeze the article by means of a freezing-mixture, applied as stated, as well as to preserve it afterward by means of a freezing-mixture, applied as stated; and the claim may cover the process when the chamber is used both to so freeze and so preserve the article, and also when it is used only to so freeze the article, and also when it is used only to so preserve the article. The article is preserved when it is only frozen in the chamber. It is preserved when it is only kept in the chamber, after being first frozen elsewhere. It is preserved when it is frozen in the chamber, and then continues to remain in the chamber. That this is the scope of the claim is shown by the fact that the specification speaks of "the preliminary processes of freezing and coating," and states that the patentee does not confine himself to the use of either or both of those preliminary processes. The preliminary process of freezing referred to is described as one of freezing the article in a box where the open pans of salt and ice are shut up in the box with the article. It is not the process referred to in the claim, which expressly requires that the article shall be in a close chamber, and that the freezing-mixture shall have no contact with the atmosphere of that chamber. Therefore, whenever an article already frozen is preserved in a frozen state in a close chamber by means of a freezing-mixture, which has the effect to keep the frozen article in such frozen state, while, at the same time, such mixture has no contact with the atmosphere of the preserving-chamber, the claim of the patent is infringed, provided that it is done "substantially as set forth" in the specification. Full effect must be given to the words "substantially as set forth." How is it set forth that the process must be practiced? It is not required that there shall be no contact between the article that is undergoing preservation and the metal which is interposed between such article and the freezing-mixture. On the contrary, the specification says that the fish are "packed closely together" in a box, directly through which run the metallic tubes which contain the freezing-mixture. If the fish are thus packed closely together, some of them must be thus packed around the tubes. There is no direction that none of them are to be in contact with the tubes. It is true that the specification speaks of the fish as being preserved because surrounded by a dry and freezing atmosphere. They will be surrounded by so much of a dry and freezing atmosphere as can surround fish packed closely together in contact with the tubes. All the atmosphere there is will be dry and freezing.

With this view of the claim, the invention covered by it, so far as preserving the frozen article is concerned, (and the claim covers that by itself), is anticipated by what is proved in regard to the use of the process of

preserving frozen ice-cream. Anterior to the patentee's invention, ice-cream, frozen, was preserved in a frozen state in a close chamber by means of a freezing-mixture which had no contact with the atmosphere of the chamber. The frozen ice-cream was thus preserved in a frozen state for a length of time in one instance, as is shown, twenty-four days, and it might have been preserved an indefinite length of time by renewing the freezing-mixture. The freezing-mixture surrounded the metallic vessel containing the frozen ice-cream, instead of being in pipes which ran through such vessel; but that made no difference in the process. Some of the frozen ice-cream was in contact with the metal interposed between it and the freezing-mixture, as some of the fish, in the practice of the plaintiff's process, are in contact with the metal interposed between them and the freezing-mixture. All the atmosphere there was in the vessel containing the frozen ice-cream was dry and freezing. The frozen ice-cream was, in its frozen state, not a liquid but a solid. It was no more a liquid than a frozen fish is a liquid. A fish, before being frozen, consists largely of watery particles. If it did not it could not be frozen, for it is the watery particles in it that are frozen. What is frozen in the ice-cream and what is frozen in the fish is the same thing, the liquid parts. Those are proportionably greater in the unfrozen ice-cream than in the unfrozen fish. That is the only difference.

The specification of the patent, in describing the process claimed describes the process previously used for preserving frozen ice-cream. All that the patentee has done, according to his claim, is to take the frozen ice-cream out of the vessel and put into it a fish or other article, frozen or unfrozen. That is no patentable invention. If the process of preserving the frozen ice-cream had not existed previously the use of such process, in the manner stated, would be within the claim of the patent, and would be an infringement of it. The prior use of such process must, therefore, be an anticipation of the claim of the patent at least in a case like this.

The patentee may be the first person who has practically succeeded in introducing into the market, at all seasons, salmon as fresh as when first caught, and may thus have supplied a great desideratum and have established a business that is commercially profitable. He may have invented something, in that connection, which is capable of being protected by a patent, and he may have described in this specification, or shown in the model or drawings accompanying it, something which may be claimed, and well claimed as an invention, and which may be secured to him by a reissue. But the difficulty with the present claim is that it is too broad, and that it covers nothing but a process, and that a process practiced before, substantially in the same manner set forth in the specification.

For these reasons the bill must be dismissed with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

20,783.—*Breech-Loading Repeating Fire-Arms.*—Granted to CHRISTIAN SHARPS, January 23, 1859. Hearing January 8, 1873.

22,775.—*Cotton-Presses.*—Granted to ZACHARIAH ATKINSON, February 1, 1859. Hearing January 15, 1873.

22,786.—*Harvesters.*—Granted to CHARLES G. DICKINSON, February 1, 1859. Hearing January 15, 1873.

22,787.—*Stoves.*—Granted to PORTER DODGE, February 1, 1859. Hearing January 15, 1873.

22,792.—*Machines for Manufacturing Wooden Troughs.*—Granted to SAMUEL T. FIELD, February 1, 1859. Hearing January 15, 1873.

22,802.—*Mills for Grinding Cane, &c.*—Granted to ISAAC A. HEDGES, February 1, 1859. Hearing January 15, 1873.

22,809.—*Bakers' Ovens.*—Granted to GEORGE C. JENNISON, February 1, 1859; reissued March 5, 1872. Hearing January 15, 1873.

22,812.—*Machine for Rolling Horseshoe-Iron.*—Granted to WILLIAM W. LEWIS, February 1, 1859; reissued March 30, 1869. Hearing January 15, 1873.

22,833.—*Sewing-Machines.*—Granted to WILLIAM W. WADE, February 1, 1859. Hearing January 15, 1873.

22,841.—*Harness Saddle-Trees.*—Granted to SAMUEL E. TOMPKINS and JOHN MACLURE, February 1, 1859; reissued January 2, 1872. Hearing January 15, 1873.

22,865.—*Harvesters.*—Granted to WILLIAM K. MILLER, February 8, 1859; reissued in five divisions, and numbered, respectively, 2,966, 2,967, 2,968, 2,969, and 2,970, June 5, 1866. Hearing January 22, 1873.

22,899.—*Carpet-Sweepers.*—Granted to N. B. PRATT, February 8, 1859. Hearing January 22, 1873.

22,902.—*Water-Wheels.*—Granted to JOHN TEMPLE, February 8, 1859; reissued February 10, 1863. Hearing January 22, 1873.

22,941.—*Railroad-Car Springs.*—Granted to AUGUSTUS B. DAVIS, February 15, 1859; reissued January 6 and March 17, 1863. Hearing January 29, 1873.

22,947.—*Wrenches.*—Granted to DANIEL P. FOSTER, February 15, 1859. Hearing January 29, 1873.

22,990.—*Mop-Heads.*—Granted to LUKE TAYLOR, February 15, 1859; reissued November 10 and 24, 1868, and October 19, 1869. Hearing January 29, 1873.

23,001.—*Elastic Toys.*—Granted to LUCIUS P. PORTER, February 15, 1859. Hearing January 29, 1873.

23,011.—*Water-Wheels.*—Granted to N. F. BUENHAM, February 22, 1859; reissued September 1, 1863. Hearing February 5, 1873.

23,022.—*Molding Covers for Cook-Stoves.*—Granted to GEORGE W. GARDNER, February 22, 1859. Hearing February 5, 1873.

23,032.—*Steam-Pressure Gages.*—Granted to T. W. LANE, February 22, 1859. Hearing February 5, 1873.

23,033.—*Hose-Couplings.*—Granted to ROBERT B. LAWTON and WILLIAM H. BLISS, February 22, 1859; reissued December 21, 1869. Hearing February 5, 1873.

23,034.—*Fire-Plugs.*—Granted to JOSEPH L. LOWRY, February 22, 1859; reissued August 14, 1860, and July 30, 1872. Hearing February 5, 1873.

23,040.—*Locks.*—Granted to LYMAN F. MUNGER, February 22, 1859; reissued December 12, 1871. Hearing February 5, 1873.

23,060.—*Electro-Magnetic Fire-Alarm Apparatus.*—Granted to MOSES G. FARMER, February 22, 1859. Hearing February 5, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 12, 1873.

23,087.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 12, 1873.

23,105.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 12, 1873.

23,159.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PETTES, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEBE, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859. Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste-Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

24,008.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

EXTENSIONS GRANTED.

22,539.—*Improved Wringing-Machine*, granted to JOHN ALLENDER, January 11, 1859; reissued June 24, 1864, numbered 1,709; again reissued November 8, 1864, numbered 1,807; and again reissued April 18, 1865, numbered 1,934. (WILLIAM BELCHER, administrator.)

Claim.—1. A roller made of a spirally-coiled spring arranged on a shaft or roller made smaller at the center than at the ends, as and for the purposes specified.

2. A roller so constructed as to yield more at its center than at or near its ends, covered with vulcanized rubber or any other elastic compound impervious to water, substantially as and for the purpose set forth.

3. Cog-wheels, in combination with rollers of vulcanized rubber, or any other elastic substance or compound impervious to water, for the purpose set forth.

4. Rollers made of or covered with vulcanized rubber, or any other elastic substance or compound impervious to water, when used in combination with cog-wheels and a spring or springs around the shaft of the roller, for the purpose set forth.

5. Rollers for washing or wringing machines, made of or covered with vulcanized rubber or any other elastic substance or compound impervious to water, when used in combination with adjusting spring or springs.

6. Rollers for washing or wringing machines, made of or covered with vulcanized rubber or any other elastic substance or compound impervious to water, when used in combination with adjusting spring or springs and screw or screws to adjust the pressure to the spring S and rollers.

22,666.—*Manufacture of Emery Wheels and Sticks*, granted to THOMAS J. MAYALL, January 11, 1859.

Claim.—The employment of hard vulcanized rubber, tempered with olive oil, as set forth, in combination with powdered emery, or its equivalent, for the manufacture of polishing wheels and sticks, as specified.

22,572.—*Improvement in Spectacle-Frames*, granted to THEODORE NOEL, January 11, 1859; reissued November 9, 1859, numbered 3,725.

Claim.—1. The combination, with an eye-piece of a pair of spectacles or eye-glasses, of a spring, so arranged upon the eye-piece, over the point where its continuity is broken, that it will permit of the expansion of the said eye-piece, sufficiently to allow of the insertion and withdrawal of the glass, and thereafter cause the said eye-piece to resume its normal position, substantially as and for the purpose herein specified.

2. The combination of the spring *b* with the opening *a* and temple *c*, substantially as herein specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 7, 1873.]

6,336.—*Carpet.*—WILLIAM GILMOUR, Kidderminster, England, assignor to HENRY JECKS DIXON & SONS, same place.

6,337.—*Carpet.*—JOHN POWELL, Kidderminster, England, assignor to HENRY JECKS DIXON & SONS, same place.

6,338.—*Sword Hilt and Scabbard.*—VIRGIL PRICE, New York, N. Y.

6,339.—*Carpets.*—ANDREW WEBSTER, Jr., New York, N. Y., assignor to CHARLES M. BAILEY, same place.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date January 7, 1873.]

1,099.—*Champagne-Wine.*—F. DE BARY & CO., New York, N. Y.

1,100.—*Shirts.*—CHARLES W. JENKS, Somerville, Mass.

1,101.—*Files.*—THOS. JOWITT & SON, Sheffield, England.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date January 7, 1873.]

ORIGINAL PATENTS.

134,504.—*Propelling Canal-Boats.*—ADELBERT AMES, Natchez, Miss.

The power of the engine is applied through mechanism acting against a solid fulcrum.

Claim.—The combination, substantially as described, of an engine, a push-pole, and spiked shoe, the shoe being connected by a universal joint, as specified.

134,505.—*Sectional Steam-Boiler.*—GEORGE H. BABBOCK, Plainfield, N. J., and STEPHEN WILCOX, Brooklyn, N. Y.

Claim.—1. The within-described series of pipes D C^1 C^2 with the front connections F and back connections E arranged relatively to each other and to the furnace, and to suitable provisions for allowing the steam and water to separate, substantially as herein specified.

2. In combination, the central and side vessels of the upper series B, the connections F at each side, the side inclined pipes C^1 C^2, and the opposite inclined sets D, all as and for the purposes herein specified.

134,506.—*Guide for Rotary Rock-Drills.*—ALBERT BALL, Claremont, N. H., assignor to SULLIVAN MACHINE COMPANY, same place.

The flanges, united by a web, are fed downward through a suitable slot in the arm of a collar into the hole last formed to guide and brace the drill in forming the next, and the cutter at the same time breaks the narrow web of rock left between the two holes.

Claim.—1. The combination of the cutter S with a rotary drill bit or head and a drill-guide, substantially as described, and for the purpose set forth.

2. The combination of the flanges *f f*, the web A', and a drill head or bit, substantially as described, and for the purposes set forth.

3. The guide sleeve or collar A, in combination with the drill-guide and drill-head, substantially as described.

134,507.—*Stump-Extractor.*—EDWIN BAYLISS, Massillon, Ohio.

Claim.—1. In a stump-extractor, the combination, with the tripod or supporting-legs, of the circular pedestals adapted, substantially as described, to support the machine when in operation, and also to serve as transporting-wheels, as set forth.

2. In combination with the circular supporting-pedestals, operating as described, the locking-straps *g g*, to assist in maintaining the wheels in proper position when used for transporting the machine, substantially as described.

3. In combination with the differential screw C C', the slotted nut F F' and pin c^3 for locking said nut to the screw, substantially as described.

4. In combination with the cap A^1 and nut E, the pin c^1, or an equivalent locking device for holding the nut E from turning with the screw C C', substantially as described.

5. In a stump-machine, the combination of the differential screw C C', the nuts E F F', and the sweep D, substantially as described.

6. In a stump-machine, the combination of the sweep D and the adjustable braces D', substantially as described.

7. In combination with the differential screw C C' and nut E, the removable sweep D, adapted to be applied to either the screw or the nut E at will, substantially as described.

8. In combination with the differential screw C C' and nut E, the sweep D and brace D', adapted to engage with both the screw and the nut, and to move them both in the same direction at the same time in the lower nut F F', substantially as described.

9. The nut E provided with the movable section and the cam-shaft, substantially as and for the purpose set forth.

134,508.—*Wax-Thread Sewing-Machine.*—EDWIN E. BEAN, Boston, Mass.

The arm *k* and its enumerated connecting devices directly operate the awl-bar, the presser, and thread-guide. The arm *k* is connected to the awl-bar, and carries the lever *o*, which strikes the projection from the presser-bar and raises it more or less, according to the position of the screw. A link from the projection *v* connects with the slotted knee which operates the thread-guide.

Claim.—1. In combination, the arm *k*, projection *n*, lever *o*, regulating-screw *r*, and presser-foot bar *m*, constructed and arranged as and for the purpose herein shown and described.

2. In combination, the arm *k*, projection *v*, link *w*, slotted knee-lever *x*, crank-pin *z*, and the thread-guide bar *u*, constructed and arranged as herein fully set forth and described.

134,509.—*Wax-Thread Sewing-Machine.*—EDWIN E. BEAN, Boston, and FRANK BEAN, Medford, assignors to "THE CONSOLIDATED WAX-THREAD SEWING-MACHINE COMPANY," Boston, Mass.

The crank mentioned in the first clause has a pin which engages the upper end of the hooked link and causes a cam to press the plate against the presser-foot holder in the shoe, and by these devices the presser is always raised the necessary distance above the material, whatever may be its thickness. The needle and cast-off bars are mounted in guides or disks, which have a reciprocating rotary motion in order to move the needle to move the material, and the needle and cast-off reciprocate in these guides in the usual manner.

Claim.—1. The mechanism for operating the presser-foot holder *e*, consisting in the shaft *a*, crank *c*, pin *i*, hooked link *k*, cam *t*, spiral spring *p*, plate *g*, and shoe *f*, as herein set forth and described.

2. The revolving disks *s s'*, in combination with the link *t*, guides *u u'*, and needle-holder *w*, and cast-off holder *x*, as and for the purpose set forth.

3. The mechanism for operating the disks *s s'* and needle-holder *w* and cast-off holder *x*, consisting of the rocking-shaft 1, crank 2, link *y*, lever 3, link 2, crank 5, and connections 6 and 7, as and for the purpose set forth.

4. The arrangement of the slotted levers 11 and 13 and stud 15, in combination with the eccentric 9 and rod 10, for operating and adjusting the throw of the needle and cast-off, as fully set forth and described.

5. The mechanism for operating the needle to feed or move the material, consisting of the curved slotted rocking-lever 23, link 25, crank 26, and rocking-shaft *r*, in combination with the revolving disks *s s'*, as and for the purpose herein set forth and described.

134,510.—*Horse-Power.*—LEVI H. BRATT, South Bend, Ind.

An endless chain passes around four pulleys arranged above and below each lever, so that the slack of one horse is taken up by the others.

Claim.—The arrangement of the various pulleys B C D, with the endless chain E passing around them, in the manner and for the purpose specified.

134,511.—*Horse-Power.*—LEVI BRONSON, Buffalo, N. Y., assignor to JAMES BRATLEY, same place.

Claim.—1. I claim, in a horse-power, the master-wheel center cap or hub B, when constructed with or having arranged on it the upper and lower sweep-holes *a a'*, combined for the purpose of changing to "down" or mounted power, as hereinbefore fully specified.

2. I claim, in a horse-power, the supplementary bottom pieces G G, suitably attached to the bottom of the main frame A, and setting between the forward and hind wheels and axles of the truck, for the purpose of bringing the line-shaft E lower down and allowing the hub to be elongated, as hereinbefore fully set forth.

134,512.—*Photographic-Plate Holder.*—JOSEPH BUCHTEL, Portland, Oregon.

The springs being movable, the points of pressure on the glass are nearer the bearing-points than formerly.

Claim.—1. The slotted pieces G, supporting-points E, retaining-cups F, with the bearings L, same being movable vertically and laterally, so made as to be adjustable to varying sizes of plates.

2. The movable springs C working in a slot, M, as shown, the whole substantially as described, and for the purpose set forth.

134,513.—*Machine for Preparing Flour.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

Claim.—1. A case with supply-chute near one end and a delivery-chute near the other end, in combination with a revolving horizontal shaft armed with ranges of flexible beaters and divisions placed within such case having openings to allow the material to pass from one range of beaters to the next, substantially as set forth.

2. The divisions *d d* having depressions *e* and openings or mouths *i*, as set forth, in combination with the ranges of beaters, as and for the purposes specified.

134,514.—*Coffee-Pot.*—HENRY J. CHILDS, New York, N. Y.

The funnel *n* and its small openings serve to retain the deleterious matter of the coffee-grounds, and the same can be removed before pouring out the coffee.

Claim.—1. The removable cylinder *g*, detachable funnel *n*, band *l*, and strainers *i r*, in combination with the support *c* and pot *a b*, as and for the purposes set forth.

2. The receptacle for condensation around the cylinder *c*, formed by the partition *f* and division *w*, in combination with the flanged cover, and plug or cock *x*, as and for the purposes specified.

134,515.—*Coffee-Pot.*—HENRY J. CHILDS, New York, N. Y.

The particles of coffee are retained and only the extract allowed to pass into the pot. The upper portion of the pot is closed to retain the aroma.

Claim.—The vessel *a b*, containing the partition *h*, hot-water space *l*, and cylinder *f*, in combination with the cylinders *p q*, strainers *r*, and cover *i u*, as and for the purposes set forth.

134,516.—*Steering Apparatus.*—DAVID N. B. COFFIN, Jr., Boston, Mass.

The shaft has secured upon it a bevel-wheel, which meshes into the teeth on the inner surface of the covering cap or plate *l*, and the revolution of this plate gives motion to the upright shaft *h*, which is furnished with cogs on its lower extremity. These cogs take into the teeth of three gears, *f*, which gears have elastic interior rings or bearings and mesh into the teeth of a plate securely fastened to their rudder-post, and by their revolution give rotary motion to said post. A stem, fitting into the rudder-post, revolves with it, and rising through the center of shaft *h* has a cap on its top, a cap and a rudder-indicator.

Claim.—1. The arrangement and combination of the shaft *n*, gear *m*, gear *l*, gear *h*, gear or gears *f*, gear *e*, and frame *i*, substantially as described.

2. The elastic gears *f*, constructed and applied substantially as and for the purpose set forth.

3. The frame *i* furnished with the tongues *j*, in combination with the frame *b* and its grooves *k*, the same being constructed and arranged substantially as described, and for the purpose set forth.

4. The inverted toothed wheel *l*, constructed and applied, in combination with the frame *i* and gear *m*, so as to perform the double function of gear and cover, substantially as and for the purpose set forth.

5. The screw *s* and jaws *x x*, in combination with the frame *i*, wheel *l* and its flange *y*, when arranged to operate substantially as and for the purpose set forth.

6. The cover *p* provided with the attached pointer and connecting-rod *q*, in combination with the hollow gear *h* and rudder-stock *c*, substantially as and for the purpose set forth.

134,517.—*Windlass.*—DAVID N. B. COFFIN, Jr., Boston, Mass.

Claim.—The short lever *b* when constructed with the lever-socket and the series of pivotal holes, and arranged in combination with the beam *a*, fulcrum-link *c*, and a step provided with one or more pivotal holes, substantially as and for the purpose set forth.

134,518.—*Thread-Cutter for Sewing-Machines.*—FREDERICK COLLINS, Portland, Me.

The cutting-blades are arranged in a removable box, which is intended to be placed in an opening in the plate.

Claim.—The combination of the removable box or case A, the stationary blade C, the movable cutter-lever B, the knob *b*, the spring *d*, and the stop *e*, all arranged and constructed substantially in manner and for adaptation to and use with a sewing-machine, D, as explained.

134,519.—*Mode of Attaching Pitmen to Sickle-Bars.*—VINCENT COX, New Vienna, Ohio.

The pitman is attached to the sickle-bar of reaping and mowing machines, so as to be out of the way of other parts of the machinery when it is properly adjusted.

Claim.—1. Attaching and adjusting the pitman A to the sickle-bar B by aid of the set-screw *b* and groove *a* in the pin D, substantially as and for the purpose set forth.

2. The pitman A, attached and adjusted to the sickle-bar B, substantially as and for the purpose set forth.

134,520.—*Water-Wheel.*—GARDNER COX, Pierrepont, N. Y.

To simplify the construction a horizontal wheel is placed outside a curb, which extends downward from the bottom of the flume. To the curb guides, having a disk attached to form chutes, are riveted. The gates, which are hung on rods secured to a plate through which the shaft passes and to the curb, have straight inner edges abutting against the edges of the plate, and curved outer edges abutting against the curb. By means of a sleeve and levers the gates are opened and closed.

Claim.—1. The combination of a wheel, I, curb J, disk A, and guides *c*, arranged substantially as described.

2. The swinging gates L, connecting-rods D', sleeve M', shaft B, and lever M, all combined as specified.

3. The curb J, guides *c*, disk A, cone K, plate C, and rods H, all arranged, as described, for holding the disk firmly in the center of the wheel.

134,521.—*Corn-Planter.*—WILLIAM J. C. CRANDALL, Steel's, Ind.

Wheel-spindles attached to the ends of the rear edge of a narrow platform, to the front edge of which, in recesses next to the wheels, are attached the front ends of the drill-beams. These can be raised by levers to admit under them a spring-stop, which can be retracted by another lever and rods behind the platform. A bar pivoted on the top of each beam has at its rear end the seed-slide, and at right angles on its front end a short bar with a series of holes, through one of which a pin can be dropped into one of three zigzag slots to regulate the intervals of seed-dropping.

Claim.—1. The driving-wheel hub a provided with circumferential zigzag grooves 1, 2, and 3, in combination with the L-shaped lever D and screw *c*, or their equivalents, for operating the dropping mechanism, substantially as herein set forth.

2. The casting *m*, constructed with the two seats for the lever K, when used in connection with the mechanism of the seed-dropping device, substantially as set forth.

134,522.—*Fire-Proof Paint.*—CHARLES P. CROSSMAN, West Warren, Mass., assignor of one-half his right to FRANKLIN BEMIS, same place.

Claim.—1. A composition whereof the ingredients are common lime, hydraulic lime, siliceous or argillaceous matter, and cow's milk, substantially in the proportions specified.

2. A composition whereof the ingredients are common lime, hydraulic lime, Brandon brown, siliceous or argillaceous matter, and cow's milk, all substantially in the proportions above specified.

134,523.—*Match-Safe.*—LEVI DAROZIR, Worcester, Mass., assignor to himself and JULES MORISETTE, same place.

Claim.—An improved match-safe, consisting of a main box or receptacle, A, for packages and a separate and smaller one, C, for separated matches, the latter being affixed to or formed on the outside of the former, and both being provided with covering-lids, substantially as herein shown and set forth.

134,524.—*Apparatus for the Production of Spirits and the Prevention of Fraud upon the Revenue.*—JOSEPH DAWSON, Staunton, Va.

Claim.—1. The six-way cock, in connection with which is a pawl-and-ratchet wheel to prevent the plug or key from being reversed, the cock constructed as described in drawing, and for the purposes set forth.

2. The combination, with said cock, of a glass tube containing a hydrometer and thermometer for indicating the gravity and temperature of the spirits.

3. The combination, with said cock, of a glass tube in connection with a scale for the purpose of indicating the number of wine-gallons produced at each charge of the still.

4. The combination, with a six-way cock, of a sample vessel for the purpose of retaining an accurate proportional quantity of each charge, which sample is designed to be tested periodically by an authorized official so as to be a check upon the distiller's reports and insure the correctness of the same.

5. The combination, with a six-way cock, of a measuring-cistern for the purpose of receiving all the spirits produced at each charge of the still and retaining the same until the indications showing the quantity in wine-gallons and the temperature and gravity can be taken.

134,525.—*Shoe and Leather Polisher.*—JOHN DAY, New York, N. Y.

A receptacle with a plunger, a perforated bottom, and brushes.

Claim.—1. The lubricator herein described, consisting of the combination of a receptacle for lubricant, &c., perforated bottom, and plunger, substantially as set forth.

2. The combination of the bandle A, plunger B C, constructed as described, receptacle D, perforated bottom E, and sockets 3 4, and brushes, substantially as and for the purposes specified.

134,526.—*Motor for Sewing-Machines.*—WARREN R. DUNTON, United States Army.

A frame attached to a sewing-machine by means of clamps, and set-screws inclosed within said frame, is the spring motor connected by gearing with the crank and fly wheel.

Claim.—An improved motive-power attachment for sewing-machines, having a frame-work or attachment carrying geared wheels, and a spring which can be attached to the machine or machines upon which it is to be used by means of metallic clamps and screws; the controlling or regulating power by means of the ratchet-wheel, double curved pawl, and balance-wheel, or equivalent means for that purpose; and the starting and stopping device by means of the spring, stud, lock, and lever, bent to work in connection with the ratchet-wheel, double curved pawl, and balance-wheel, or equivalent means, for the purpose herein set forth and specified.

134,527.—*Exercising Apparatus.*—HARRY E. EASTMAN, Green Bay, Wis.

Claim.—The handles A provided with the hooks C, in combination with the elastics B, arranged substantially as set forth.

134,528.—*Fruit-Drier.*—ALFRED EDWARDS, New Haven, Conn., assignor to ALFRED R. EDWARDS, Chicago, Ill.

Heat as great as the fruit will bear without being cooked is passed through the drying-chamber, and the fruit dried in a few minutes.

Claim.—The chamber E within a vertical steam or water heating apparatus, provided with the shafts I I' and endless bands P, or their equivalents, arranged to receive and carry the plates R, and constructed for the flow of heated air into and through the said chamber, in the manner and for the purpose described.

134,529.—*Lumber-Drier.*—ALFRED EDWARDS, New Haven, Conn., assignor to ALFRED R. EDWARDS, Chicago, Ill.

The heat is supplied from the heating-chamber, and steam is generated from the moisture in the lumber until the timber is dried.

Claim.—1. The heating-chamber, formed by the hollow walls and bottom *e*, combined with the partition *s* around the said chamber so as to form a flue, *n*, to reconduct the air beneath the said chamber and return it through the said chamber, substantially as described.

2. In combination with the subject-matter of the first clause of claim, the condensing-tubes *f* arranged above the chamber, substantially as described.

3. In combination with the subject-matter of the first clause of claim, the inclined drip-plates P, more or less in number, and with or without the ledges *k*, substantially as specified.

134,530.—*Music-Rack.*—CALVIN L. ELY, Branford, Conn.

To prevent music-sheets breaking and falling over the top of piano music-racks.

Claim.—An extension for the music-rack of musical instruments, substantially such as described, provided with loops or clasps B, by which the extension is attached to the rack proper, as herein set forth.

134,531.—*Harvester.*—JOEL FARRINGTON, Corry, Pa.

Claim.—1. The crank-arm *g'* for raising the vibrating end of the cutter-frame, in combination with the lifting-lever G G', for raising and lowering the hinged finger-bar, substantially as described.

2. The combination of lever G G', crank-arm *g'*, and gag-lever I with the vibrating frame and hinged finger-bar, all arranged and operating substantially as described.

3. The gag-lever I provided with the overhanging spur or stop *i'*, and arranged in the described relation to the hinged finger-bar and lifting-lever G, as and for the purpose specified.

134,532.—*Machine for Molding Marble.*—JAMES FINN, Boston, Mass.

A person at one and the same time may elevate the slab and force it forward, thus causing the grinder to cut a larger groove than it would were the slab to be moved in one direction only against such grinder.

Claim.—1. The combination of the elevating platform or platforms H and their operative mechanism with the rotary grinder D and its supporting-table C, all being arranged substantially as and to operate as described.

2. The combination of the rotary grinder D, its supporting-table C, one or two elevators, H, and the operative mechanism thereof, and one or two pressers or means of automatically pressing the slab or slabs up to the grinder, all being substantially as described.

3. In each automatic presser, the combination of the adjustable bearers *k k* and their clamp-screws *l l* with the upright arms *d' d'*, connected and arranged as described.

134,533.—*Spring Motive Power.*—THOMAS BURKE FOGARTY, New York, N. Y.

Claim.—The combination of two springs, by which the inequality of a regulating-spring or springs operates as a check upon the inequality of a motor-spring or springs, substantially as described.

134,534.—*Mandrel for Making Spools.*—JOHN W. FOSTER, Pawtucket, R. I.

A spindle, provided with projecting wings, is inserted in a lathe-chuck. The spools, after being bored, are forced upon the spindle, and are retained in that position by the wings.

Claim.—The device, constructed in the manner and used for the purposes substantially as shown and described in the foregoing specification.

134,535.—*Spindle and Bobbin for Spinning-Frames.*—RICHARD GARSED, Philadelphia, Pa.

For the purpose of better securing the part *a* and for giving a positive hold between the spindle and bobbin.

Claim.—A spindle, A, flattened, as at *c*, at the upper end of the bolster portion *a'*, in combination with the bobbin B having pins or cheek-pieces *c* inserted into its lower end, substantially as set forth.

134,536.—*Reed-Organ.*—WILLIAM H. GERRISH, Boston, Mass.

The flexible cover slides back and forward in grooves. It is made of slats fastened to a cloth or other backing. Noise or rattle is prevented by clamping devices.

Claim.—1. The flexible sliding cover B, arranged to move in the curved grooves *a a*, as herein set forth, in combination with the case and action of a reed-organ, substantially as described.

2. The flexible sliding cover B, in combination with the case of a musical instrument, and any suitable means for clamping the same to prevent vibration thereof, substantially as described.

3. The combination of the flexible sliding cover B, the case A, the pressure-bar *c*, and spring *d*, all constructed and operating substantially as described, for the purpose specified.

4. The combination of the flexible sliding cover B, the case A, the pressure-bar *f*, and the stop-bar *g*, arranged and operating substantially as described, for the purposes specified.

134,537.—*Hand-Truck.*—LEONARD GILSON, Boston, Mass.

The truck has its front and rear guide-wheels pivoted adjustably at a different altitude from the central wheels.

Claim.—1. In hand-trucks containing central primary wheels and end wheels, as and for purposes stated, mounting the end wheels in an adjustable manner, whereby their altitudes with respect to one another and to the platform and floor may be varied, substantially as and for purposes stated.

2. In hand-trucks containing central wheels and end wheels which are adjustable to different altitudes from said central wheels, as stated, swiveling said end wheels with respect to the platform, substantially as and for purposes stated.

3. The employment of the rollers G, or their equivalents, essentially in manner and for purposes stated.

134,538.—*Manufacture of Boot and Shoe Heels.*—CHARLES W. GLIDDEN, Lynn, Mass.

The heel-lifts with irregular edges are firmly secured between clamp-plates, over which is a hammer, the face of which is of the shape to be imparted to the edge of the heel-blank. By this process the outer surface is solidified and the edge of each lift turned upward, securing the concavity without the use of a band.

Claim.—1. The method of edge-shaping boot and shoe heels by clamping each heel in a machine and subjecting the edge to the action of an automatic hammer, substantially as described.

2. A boot or shoe heel which is edge-shaped by clamping the heel-lifts together and subjecting the edge of the blank to the automatic treatment, substantially as described.

3. A boot or shoe heel in which the edges of the lifts are driven upward (by the automatic hammering process while the heel is clamped) to form the concave seat, substantially as shown and described.

4. The combination of the rotative heel-clamp with the hammer, formed and operated substantially as described.

5. The heel-clamp, having the clamp-plate *b* formed with the chamfer *x*, substantially as and for the purpose set forth.

6. In combination with the heel-clamp, the tilting-frame *a* for holding the heel to the action of the hammer, substantially as described.

134,539.—*Animal-Trap.*—JACOB W. GREENE, Chillicothe, Mo.

Separating the decoy-chamber from bait-chamber by lengthened tubes, &c.

Claim.—The combination of the harbor or bait-chamber B with the entrance-tubes A A, and tube *A'* connected to the cage C, supplied, respectively, with the doors *a a' a'*, substantially as and for the purpose set forth.

134,540.—*Gang-Plow.*—GEORGE A. GROVER, East Clarkson, N. Y.

Claim.—1. The branch-arm *i* of the plow G guided in the standard H, as and for the purpose set forth.

2. The plows G provided with the shanks *g* and branch *i* and pivoted to the bars *a a a* of the frame A, in combination with the rock-shaft K, arm *m*, guide-standards H, pulley K, and cord or chain I, all constructed and arranged as and for the purpose described.

134,541.—*Die for Forming Sewing-Machine Shuttles.*—DANIEL W. HALE, Middletown, Conn.

A series of three dies partially finish the blank at the first heat. A fourth die completes the operation by pressing the surplus metal out, in the form of a fin, around the edges.

Claim.—A series of dies, substantially as shown and herein described, for forging shuttles.

134,542.—*Hanging Doors.*—GODFREY HEEGLER, San Francisco, Cal.

The knob operates the double bolts C C through the pinion and racks, and the bolts also serve as hinges, a set being applied at each edge of the door.

Claim.—In combination with the pins C, the racks D, pinion E, and the operating knobs F, when constructed substantially as and for the purpose described.

134,543.—*Automatic Fan.*—ALLEN P. HEIDT, New York, N. Y., assignor to himself and JOHN H. HUBBELL, same place.

The standard is adjustable. An alarm can also be prearranged to wake the fanned party at a given time.

Claim.—1. The standard *h o*, adjustable in its length and provided with the foot *p* and clamp *r*, in combination with the fan *l* and its actuating-gearing, substantially as set forth.

2. An alarm mechanism, combined with a fan and its actuating mechanism through the intervening shaft *t*, wheel *v*, and toe *i*, substantially as and for the purposes set forth.

134,544.—*Chair-Frame.*—LEVI HEYWOOD and ELIAS E. HORTON, Gardner, Mass., assignors to HEYWOOD BROTHERS & CO., same place.

The frame is made from one piece of bent wood, and the ends are secured together by a spline driven tightly into a groove.

Claim.—A chair-seat frame made from one piece of bent wood, when the ends thereof are secured together by a groove and spline, in the manner and for the purpose described.

134,545.—*Chair.*—LEVI HEYWOOD, Gardner, Mass., assignor to HEYWOOD BROTHERS & CO., same place.

A bent band is secured under the seat-frame, to which the front legs are mortised, the rear legs being mortised both to the band and the seat-frame, and extending above the latter to form the back of the chair.

Claim.—A chair constructed with a bent band made as herein described and having the front legs mortised thereto, the rear legs being mortised both to the band and the seat-frame, and extending above the latter to constitute the back of the chair, substantially as set forth.

134,546.—*Memorandum-Book.*—HENRY M. HINSDILL, Grand Rapids, Mich.

Claim.—The office memorandum-book having its leaves secured for use by the plate B, as described, and provided with a handle or holding-piece to make a new article for the trade, as set forth.

134,547.—*Lamp.*—ROBERT HITCHCOCK, Watertown, N. Y.

This lamp is designed for burning heavy oils. An air-jacket surrounds the oil-reservoir, and two series of heat-conducting rods are connected to the lower portions of the burner and extend into the oil-reservoir for the purpose of quickly heating the main body of the oil. One series of rods is attached to the outer air-jacket, in close proximity to the burner-cap, and prevents the heat from extending down the jacket, and the other series is connected to the wick-tube and oil-tank proper. The wick-raising mechanism is also arranged in such manner that it forms a heat-conducting medium. An annular ash-box, G, is arranged in the pedestal to receive any sediment that may pass down the outer air-passage.

Claim.—1. In combination with the inner oil-tank and surrounding jacket, the two series of heat-conductors extending down into the oil-tank, the one from the jacket and the other from the top of the tank, under the arrangement, substantially as shown and described.

2. In combination with the wick-raising screw rod or shaft, the thumb-rod geared to said shaft and supported in a sleeve or open tube passing through the oil-tank, substantially as shown and set forth.

3. The arrangement of the thumb-rod and its supporting-sleeve to extend diagonally or in a slanting direction downwardly through the oil-tank, as herein shown and described, so that the milled head of the rod, by which the same is operated, may project from the lamp at or near the base of the external jacket C.

4. The combination, with the central ash shield or box under the central wick or draft tube, of an annular ash-box located in the stem or base of the lamp, beneath the central ash-box and between it and the blower, substantially as shown and set forth.

5. The wick-raising screw-shaft carrying the coupling-sleeve and jointed wick-thimble, and arranged to extend from the top of the lamp down alongside the wick-tube and within the reservoir, substantially as shown and described.

134,548.—*Check-Valve.*—JOHN C. HOADLEY, Lawrence, Mass.

A secondary check-valve is placed within the vessel holding the main check-valve, manipulated by the operator and arranged between it and the boiler, whereby the eduction of steam and water is prevented when the pump is detached.

Claim.—The arrangement within the body *b*, in the manner substantially as described, and for the purpose specified, of the two check-valves interposed between a boiler, in which pressure is maintained, and a force-pump for feeding the boiler.

134,549.—*Apparatus for Testing Girders.*—PETER H. JACKSON, New York, N. Y.

A heavy abutment-beam, composed of wood and iron, has projecting from it horizontally two pairs of arms for holding the girder, which is to be tested in such position that a ram supported against the beam may exert its power against the girder. The arms are adjustable for holding girders of different lengths. The amount of deflection of the girder being tested is shown at each moment of its treatment by a spring-index.

Claim.—1. In a machine for testing girders, the abutment-beam herein described, consisting of the wooden timbers A^1 A^2 A^3, wrought-iron beams B^1 B^2 B^3, and iron bars a^1 a^2, in combination with the clamps C, blocks H^1 H^2, and ram D, when constructed, arranged, and operating as herein shown and described.

2. The movable piece K, adapted to press against the back of the girder M under the influence of the spring L, abutting against an adjustable piece, N, and operating to indicate to the eye the exact amount of the deflection at each instant as the strain increases, all substantially as and for the purposes herein set forth.

3. The adjustable index-piece O, in combination with the movable piece K and spring L, to allow the zero to be rapidly brought to and held in any desired position to accommodate different sizes and forms of girders to be tested.

134,550.—*Drawing-Board.*—THOMAS H. KANE, New York, N. Y.

The board is inclosed by a narrow frame, between which is a rubber packing. At the back metallic bars connect opposite sides of the frame and are fastened securely by screws.

Claim.—The frame C, bars B B, India-rubber frame or strips *d d*, and fastenings *e e*, in combination with the drawing-board A, substantially as and for the purpose hereinbefore set forth.

134,551.—*Machine for Skiving Counters.*—CHARLES KENISTON, Somerville, Mass., assignor to "THE SHOE-MACHINERY-MANUFACTURING COMPANY."

The upper feed-wheel is made narrower than the lower wheel, and acts in conjunction with spring presser-feet, one upon each side of it, which bear upon the stock, and may be regulated or adjusted in accordance with the varying thicknesses of the stock. The shank of the skiving-knife or cutter is held between two jaws. Both shank and jaws are screw-threaded.

Claim.—1. In combination with the feed-wheel *c* and the feed and presser wheel *e*, the spring presser-feet *z*, arranged and operating substantially as shown and described.

2. The cutter A, adjustable in position by means of the screw-threaded shank *m* and the nut-threaded box *n*, substantially as shown and described.

3. In combination with the stationary arm *r* and shaft *f*, the adjustable or yielding bearings *g* extending down from said arm and supporting one end of the shaft *f*, the opposite end being provided with its driving-gear, substantially as shown and described.

134,552.—*Fire-Alarm Signal-Box.*—FINLEY LATTA, Cincinnati, Ohio.

Circuit, giving signals, completed through a sliding bar and spring, the bar having insulated spaces corresponding with signal to be given. This bar is elevated by a crank and descends by action of a weighted piston (to which it is connected) sliding in a cylinder closed at lower end. The air underneath the piston (which has a small perforation) acts as an automatic regulator of the speed of its descent.

Claim.—1. In telegraph-fire-alarm signal-boxes, the character bar or rod G brought into registering action by the descent of a gravitating piston, D D' *d*, within a suitable tube or cylinder, C, the descent of said piston being regulated substantially as herein described and set forth.

2. The combination of the tube C, perforated piston D E, character-bar G *g'*, pitman H, wheel I (J K K' *h h'*, spring L, shaft M *m' m''*, thimble N *n*, arm O, operating-spring P, hub R *r*, and crank T, as and for the purpose specified.

134,553.—*Rolled-Iron Molding.*—MARCUS M. MANLY and SAMUEL SELLERS, Philadelphia, Pa.

The molding is made by heavy rolls, direct from the pile, the outer and inner surfaces conforming to each other, making a strong and durable feature of iron structures.

Claim.—As a new article of manufacture, a rolled wrought-iron or steel-shell molding.

134,554.—*Bill and Letter File.*—ADONIRAM J. MARSHALL, North Buffalo, N. Y.

Clamping-boards connected by two wires crossing each other are adjustable by one of said wires engaging in a corrugated plate on the top of one of the boards.

Claim.—The arrangement of the clamping-wires *a b* and the corrugated or recessed catch C, in combination with the clamping leaves or boards A B, for the purpose hereinbefore specified.

134,555.—*Construction of Canal-Boats.*—GEORGE B. MARTIN, New York, N. Y.

Combination, in a freight-barge, of inclined longitudinal ceilings and transverse bulk-heads extending down to the bottom, whereby the freight falls down to the center of each compartment beneath the hatchways, and increased strength is given to the structure; also, the combination of the keelsons, stay-rods passing through the hatch-combings, and the inclined longitudinal ceiling.

Claim.—1. A boat for coal or other material in bulk provided with the longitudinal inclined partitions *i* and transverse inclined partitions *o p* to direct such material to a central position below the hatchway for removal, as set forth.

2. A boat made with keelsons *f* connected to the hatch-combing and with inclined partitions *i o p* for separating the cargo and facilitating its removal, as set forth.

3. The inclined partitions *i* applied to and combined with the boat and extending from the keelsons to the sides of the boat, for the purposes and as set forth.

134,556.—*Shade and Draft-Blower for Grates.*—FLORENCE MCCARTHY, Chicago, Ill.

Claim.—The adjustable draft-blower and shade C E, consisting of the parts C E, curved bar J, and suitable bearings K L, substantially as and for the purpose set forth.

134,557.—*Music-Leaf Turner.*—LEOPOLD F. MORAWETZ, Baltimore, Md.

Double-acting dogs operate upon a cogged disk, and by means of gearing connect with the toothed base of the turning-arms, the whole moved by a treadle.

Claim.—1. A boat for coal or other material in bulk provided with the longitudinal inclined partitions *i* and transverse inclined partitions *o p* to direct such material to a central position below the hatch-plane for removal, as set forth. [illegible] described, and combined [illegible] substantially as described. [illegible] separating the cargo and facilitating its removal, as set forth. [illegible] K K applied to a vibrating lever [illegible] boat and extending from the keelsons to the sides of the boat, for the purposes and as set forth.

134,558.—*Shade and Draft-Blower for Grates.*—FLORENCE MCCARTHY, Chicago, Ill.

Claim.—The adjustable draft-blower and shade C E, consisting of the parts C E, curved bar J, and suitable bearings K L, [illegible]

nation with the plate J and arms *i*, substantially as and for the purpose described.

4. The vertically-adjustable head A, carrying-arms *i*, and mechanism for actuating these arms, in combination with a treadle, D, an extensible connecting-rod, and dogs or pawls K, substantially as described.

5. The fixed pin *s*, serving the double purpose of a turning center for the leaves and also, by its upward extension *i*, a shaft for the pinion *p'*, as described and shown.

134,558.—*Button-Holing Attachment for Sewing-Machines.*—EUGENE MOREAU, San Francisco, Cal.

This mechanism is adapted to a Florence machine, and takes the place of the cloth-plate. A lever connected with the vibrating arm operates the double pawl K, one toe of which engages the teeth of wheel *h*, and when a deep tooth is engaged the other toe of the pawl engages and moves the cam-plate, which is provided with two eccentric grooves, plain and waved at suitable points. Pins from parts connected with the cloth-holder enter these grooves and give the necessary lateral and forward movements to the holder.

Claim.—1. The ratchet-wheel *h*, with its deep and shallow teeth *i* and *j*, substantially as and for the purpose described.

2. In combination with the double-grooved cam-plate C and the peculiar ratchet-wheel *h*, the double pawls *s* and *g* with the operating-lever J K, substantially as herein described.

3. The operating mechanism, consisting of the arm E with its toe G and the double cam H H', together with the levers J and K and the retracting-spring M, or equivalent devices, substantially as herein described.

4. The slide P and disk Q, with the lever R and the pitman S, in combination with the grooved cam-plate C, when connected with the cloth-plate and operating to produce a transverse vibrating motion, substantially as herein described.

5. The slide T, with its disk *r* and the lever U and link V, in combination with the grooved cam-plate C, when connected with the cloth-plate to produce a longitudinal motion and the necessary throw for the stitch, substantially as herein described.

6. The arms *w w*, with their spring *u*, when formed to rest on the cloth and throw the cord formed to the inside edge of the button-hole, substantially as described.

7. The combination of the upper clamp, having a cam-shaped slot, 5, with the arms *w w*, as described, for the purpose set forth.

8. The pitman S and latch *n*, in combination with the lever R and slotted disk Q, as and for the purpose described.

134,559.—*Solution for Preserving Canvas and Cordage.*—CHRESTEN NELSON, Gloucester, Mass.

Sulphate of zinc dissolved in water, to which is added sal-soda, soda-ash, and tartaric acid.

Claim.—The improved solution for preserving canvas and cordage prepared and used as herein set forth.

134,560.—*Slating-Nail.*—THOMAS O'GARA, Worcester, Mass.

A thin disk of metal, with a circular hole in the center, is slipped on a nail, and the corners of the nail under the head are cut or scraped up against the disk, to hold it on, by driving it into a circular die.

Claim.—A nail for fastening slate, having a thin tin or other metal cap or head, A, secured to the body B" of the nail by means of metal *a*, cut or scraped from the corners of the nail and forced against the cap, substantially as shown and described.

134,561.—*Centrifugal Apparatus for Extracting Honey from the Comb.*—WILLIAM PROBASCO, Lawrenceburg, Ind.

Claim.—1. The combination of the funnel-spout E with the hollow step C and annular groove-bearing B of a honey-extractor, all substantially as herein set forth.

2. I claim the hollow step D of the cone C, with an annular groove-bearing, B, arranged with a suitable delivery-spout, constructed substantially as herein set forth.

3. The revolving vessel H having concave bottom F and hollow journal-spout E, substantially as described.

134,562.—*Process of Preparing Moss for Mattress-Stuffing, &c.*—ADOLPHE ROCK, New Orleans, La.

The moss, after the bark has been rotted therefrom, is steeped in a bath of proto-acetate of iron. It is then removed from the bath and steamed to give it elasticity.

Claim.—1. The process of steaming moss for the purpose of imparting gloss and elasticity, after the same has been colored by the described or other process.

2. The method of treating moss by the use of the cleaning and coloring compound herein described, followed by steaming, substantially as specified.

134,563.—*Metallic Stove-Board and Floor-Protector.*—PHILIP H. ROSE, Canandaigua, N. Y.

From the outer side to the center the board is made raised of a conical or angular form.

Claim.—As a new article of manufacture, a metallic stove-board and floor-protector, raised from the outside to the center in a conical form, as shown, and provided near its edge with a series of perforations, *a a a*, and a central opening, *b*, as herein [illegible] described, for the purpose specified. [illegible]

134,564.—*Process of Preparing Moss for Mattress-Stuffing, &c.*—SARAH RUTH, Philadelphia, Pa. [illegible] moss, after the bark has been rotted therefrom, is [illegible] August 25, 1868. [illegible] coloring compound herein described, followed by steaming, substantially as specified.

134,565.—*Metallic Stove-Board and Floor-Protector.*—PHILIP H. ROSE, Canandaigua, N. Y.

From the outer side to the center the board is made raised of

upon the animal by means of the supporting-wires B B C C, hollow cylinders b'' b'' and c' c', and the straps c'' c'' and D D, arranged and secured substantially as and for the purposes set forth.

134,565.—*Machine for Cutting Matches.*—MATTHEW A. SCANLON, Akron, executor of THOMAS G. MURPHY, deceased; said SCANLON assignor of one-half his right to HARRISON S. DANFORTH, Middlebury, Ohio.

This machine is designed for cutting long match-sticks into two lengths after they have been dipped at each end.

Claim.—1. The combination of the cutting device E and the several elastic rings U U' and V V' on the shafts C and D, to hold the match-sticks while they are passing under the cutting device E, substantially as described.

2. The combination of the conveying-belt L, the oblique bands O O', and guides X X', to bring the middle of the match-sticks opposite the cutting device E.

3. The combination of the elastic belts M N and M' N', the oblique belts O O', and guides X X', and elastic rings U U' and V V', when constructed as and for the purpose described.

134,566.—*Coating for Writing-Tablets.*—AUGUST SCHINDLER, Lancaster, Pa.

Claim.—The specified composition, applied substantially in the manner and for the purpose specified.

134,567.—*Self-Acting Spinning-Jack.*—JAMES SHAW, Ballardvale, Mass.

The subject of the first clause of the claim is for moving the followers to guide the yarn upon the spindles and that of the second clause for regulating the winding according to the tension of the yarn, when the carriage is running in, by causing one or other of the racks suspended from the followers to engage and turn the gear on the top of the radial arm and move the nut to which the winding-chain is attached, the radial arm vibrating horizontally under the carriage.

Claim.—1. The combination of the stud *t*, the standard *r*, and its shaft *s*, with the guide-rail *l'*, the two levers *f g*, and the inclined plane *k*, and its adjusting mechanism, as described, all being arranged and applied together and to the shouldered rod *c* of the follower D, as and to operate substantially as set forth.

2. The combination of the two curved racks *v x*, the gear *w'*, the screw *k'*, the nut *n'*, radial arm *b'*, gear *c'*, pinion *e'*, pulley *f'*, and band *g'*, all being applied together and to the carriage A, the chain *n''*, and the follower C, substantially in manner and to operate as described.

134,568.—*Steam Vacuum-Pump.*—JOHN K. SIMPSON and SIMEON N. DRAKE, New York, N. Y., assignors of four-sixths of their right to HENRY KLENEN and MARTIN KLENEN, same place, FREDERICK KLENEN, Hoboken, N. J., and JOHN N. THOMAS, Maysville, Ky.

Claim.—1. The arrangement of the rods P P' connected to the discharge-valve C C', in combination with a disk, K, operating the steam-valve E, substantially as and for the purpose specified.

2. The combination of two cylinders or chambers, A A', with pipes L L', passages M N, and perforated chambers H H', substantially in the manner and for the purpose hereinbefore described.

134,569.—*Cabinet-Organ Case.*—ANDREAS J. SORENSEN, Erie, Pa., assignor to BURDETT ORGAN COMPANY, same place.

The case is enlarged in front below the manual, and the lower drop of the cover is fretted and made to serve also for a music-rack.

Claim.—1. An organ-case constructed with ends A A of less width below the key-board than the body, leaving recesses C C at the forward corners of the same, and the projection E, substantially as shown.

2. The fret-worked front fall G, in combination with the folding portions F F' of the lid or cover, substantially as described.

134,570.—*Burial-Casket.*—SAMUEL STEIN, Rochester, N. Y.

A skeleton frame is first constructed from molding, and within this is inserted the body-receptacle, which is made up of an outer wooden case, an intermediate sheet-metal lining, and an interior case also of wood. Two rubber gaskets, one under the turned-down edge of the metallic lining and the other above it, serve to render the casket air-tight.

Claim.—1. In a burial-casket, the combination of the metallic lining or box E with the exterior and interior covering-boxes D B, when arranged as shown, so that said metallic lining constitutes an air-tight receptacle, and said covering-boxes inclose and support the same, as herein shown and described.

2. In combination with the several boxes D E B and with the lid C, the two packing-rings *i m* with the flange *k* of the metal box inclosed between them, as and for the purpose specified.

134,571.—*Fastening Mail Bags.*—WILLIAM J. STOWELL, Baltimore, Md.

The strap C serves as a handle by which to lift the bag, and when so used increases the force of the clamping pressure by which the end of the thong is held.

Claim.—1. The lacing and buckling device B D E, applied, as at *c*, permanently to the upper edge of a mail-bag, A, which is made with lacing-holes *a a*, all constructed and operating in the manner and for the purpose herein described.

2. The attachment of the strap C of the label-holder to the bag by securing it to the part E of the lacing-thong buckle in the manner shown and described.

134,572.—*Loom.*—SAMUEL T. THOMAS, Gilford, N. H.

Each jack-bar of the heddle-actuating mechanism passes between a pin and a spring extending from the vertical arm of the lever, which places it in position to be operated by the knives, and the outer arm of the said lever is pressed down upon the pattern-chain by a spring. The pattern-cylinder is operated by a pawl pivoted to a bent lever connected by a slot and pin with the depresser bar or knife. The frictional contact between the fast and clutch pulleys is graduated by a spring and adjusting-screw.

Claim.—1. In combination with the jack-setting levers *s* positioned by the chain, and the jack-bars operated by the levers *s*, the springs r^3 s^3, the spring s^3 throwing down the lever-arm and causing the pin q^3 to throw back the jack-bar, and the spring r^3 throwing the bar forward and keeping it against the pin q^3, all substantially as shown and described.

2. In combination with the gear-sectors *l* and their slots *n* for positively moving the jack-bars and harness-levers, and locking them in open-shed position, the mechanism for locking the jack-bars in position laterally, so that each is held in position relatively to the lifter or depressor-bar, except when moved by the pattern-chain.

3. In combination with the gear-sectors *l* and their slots *n* for positively moving the jack-bars and harness-levers and locking them in open-shed position, the pawl-actuating lever k^2 operated by the pin c^3, extending from the slide-rod *h* of the depressor-bar *f*, substantially as shown and described

4. In combination with the driving-shaft *b* and its pulleys b^3 x^3, and fork g^3, and brake m^3, the adjusting-screw f^3, and spring e^3, for regulating the friction of the wheels, substantially as shown and described.

134,573.—*Heating-Stove.*—WILLIAM B. TREADWELL, Albany, N. Y.

The peculiar construction of the grate and its arrangement in a stove having an interior hollow partition over the fire-pot and air induction and circulating passages, as set out in the claims.

Claim.—1. The combination of two (or more) rings forming the fire-pot of a stove or furnace, placed one above the other, with openings for the passage of air between them, the lower edge of the upper ring being made smaller in circumference than the circumference of the inner surface of the upper portion of the lower ring, and extending below the openings referred to, for the purposes set forth, substantially as described.

2. Said rings when provided with notched ribs or flanges c^1 c^2, respectively.

3. The stove herein described, constructed with partition G, rings E and F, air-passages *a b J K x*, chamber L, exit-pipe M with perforated damper *f*, chamber B, and pipe R, combined and arranged substantially as herein shown and set forth.

134,574.—*Fire-Proof Safe.*—JUDSON W. WARNER, Oneida, N. Y.

A hollow chamber is constructed in the walls of the safe, and is kept filled with water from an ordinary service-pipe. Where the pipe enters the safe a plug of fusible metal is arranged within the pipe, so as to hold open one valve which permits the water to enter and another which permits it to leave the safe. Whenever the heat becomes intense enough to melt the pipes and cut off the supply of water, this fusible metal releases the two valves, which automatically close and keep the safe full of water.

Claim.—In combination with a safe provided with hollow chambers and an induction and eduction water-pipe, the fusible plug *d*, valve-stem, valve, and spring *h f* I, rocking lever *w*, and rod, valve, and spring *o k i*, all constructed substantially as and for the purposes set forth.

134,575.—*Fire-Proof Vault.*—JUDSON W. WARNER, Oneida, N. Y.

The body of the safe and its door is provided with hollow walls to contain water supplied from an ordinary service-pipe. In order that the flow of water may be uninterrupted through the entire structure, the pintles of the hinges are hollow and contain an opening, which, when the door is closed, registers with one in the hinge.

Claim.—In combination with a vault composed of hollow chambers and connecting water-pipes, substantially as described, the detachable door J provided with hollow slip-joint hinges K L, all constructed substantially as set forth.

134,576.—*Child's Carriage.*—JOHN B. WIGHTMAN, Brooklyn, N. Y.

Claim.—The combination of a reversible top and seat with connections which permit them to be shifted on the body of the carriage, substantially as described, for the purpose specified.

134,577.—*Manufacture of Keys for Locks.*—WILLIAM WILCOX, Middletown, Conn.

The bit, punched out of sheet metal, is placed in a mold and metal is cast upon it to form the shank. The hole *h* and the angular notches at the corners of the bit being thus filled with metal, the bit becomes securely locked.

Claim.—The method herein described of manufacturing keys, consisting in perforating the bit B at *h* and then casting the stem S in one piece around the inner end of the bit, and forming, by said casting, the neck or rivet R, substantially as and for the purpose set forth.

134,578.—*Apparatus for Physical Culture.*—GEORGE B. WINDSHIP, Boston, Mass.

By adjusting weights on a lever to be lifted in different ways to imitate rowing, pushing, &c.

Claim.—1. The combination of the straps 8 9 9' 9' with the lever O, and with or without the back-board 13, as a device for hand-shoving exercise, substantially as described.

2. The combination of the straps 8 9 9' 9' with the lever O and seat 10 placed near studs D, and with cross-bar H as a foot-rest, as a device for rowing or pulling exercise, substantially as described.

3. The handles 18 and 19 and link 20, in combination with the lever O as a device for hand-lifting exercise, substantially as described.

4. The seat 10, placed near the studs E, back-board 13, and foot-rest 14, in combination with lever O, as a device for leg exercise, substantially as described.

5. The horizontal bar G', in combination with studs D, and raised about eight feet from the platform, substantially as described.

6. The pulleys 1 2 3 4 on bars G G', in combination with straps in continuation of 8 9 and with lever O, as a device for the arm exercise of rope-climbing with moderated exertion, substantially as described.

7. The horns 15, in combination with one or more of the weights *a a a a*, substantially as and for the purpose described.

134,579.—*Chromatic-Printing Press.*—GEORGE W. WOODSIDE, Philadelphia, Pa., assignor of one-half of his right to SAMUEL L. KING, same place.

The paper is fed by rollers having adjustable segments and intermittently rotated by pawl-and-ratchet movement between stationary form and platen adjustable on reciprocating bed, on which it is held by tapes and after receiving impression passes to a paste-roller running in paste-vat, where the unprinted side is gummed. The form is inked by roller in bearings of horizontal lever pivoted on vibrating lever and held against the form by springs, the ends of said roller being cam-shaped to impart lateral movement to the distributing-rollers.

Claim.—1. The combination of the rods M N, levers O O, and connecting rock-shaft P, lever Q, and springs S with the vertically-moving bed-plate E and inking-roller M, substantially in the manner and for the purpose set forth.

2. The cams *i* on the ends of the cylinder L, in combination with the annular guides *j* of the distributing-rollers K K K, for giving a vibratory motion to the rollers in the line of their axes, substantially as described.

3. The combination of the feed-rollers V with the shafts T and T' adjustable thereon, and with the ratchet-feed, for the purpose of feeding a plurality of strips at the same time, substantially as described.

4. The combination of the paste-trough Z and cylinder Z' with the bed-plate E, as and for the purpose set forth.

134,580.—*Machine for Making Paper-Bags.*—CHARLES F. ANNAN, Boston, Mass., assignor to himself and HERBERT S. MERRILL, same place.

The sheet, one edge pasted, is spread by the diagonally-grooved guides, folded by grooved arms into a tube, and delivered to the pressing-rolls, the upper of which are grooved helically to smooth the paper inwardly, and the lower grooved longitudinally at their ends to compensate for irregularities. Between the rolls the tube is cut by sickle-edged knives reciprocated diagonally in different vertical planes with great velocity, each cutting through one ply of the tube so as to leave one end projecting. The second tube is carried forward between endless bands until its end is projected in front of folding-rollers, when a blade, reciprocating in a horizontal serpentine way, is moved back from contact with a paste-roll and tilted down in front of the folding-blade, which, reciprocating horizontally, wipes off the paste, strikes and doubles the tube-lap into the bight of the folding-rolls.

Claim.—1. The combination of the curved guide D, the closing guides E F, the feeding-rollers C, and roller G, or their equivalents, arranged as described to fold the web of paper into a flat tube as it is drawn by them, without the use of a former, substantially as described.

2. The inclined ribs or grooves in the faces of the curved guide, and the closing guides E and F, substantially as described.

3. The upper feeding-rollers provided with the helical grooves terminating at the middle thereof, substantially as and for the purpose described.

4. The lower feeding-rollers having smooth middle portions and longitudinally-fluted ends, substantially as described.

5. The serrated cutter working in an inclined direction substantially as described, as a device for separating paper and other tissues.

6. The combination of two of said cutters working in opposite directions, in different planes, as described, for the purpose of separating the two thicknesses of the paper on different lines, substantially as described.

7. The combination of the two serrated cutters with the two rocking shafts geared together, and their accessories for operating said cutters from a single reciprocating movement, substantially as described.

8. The edge-cutters P, in combination with the cutters I and J, substantially as described.

9. The pasting-bar T^3 having the movements described, in combination with the delivering-rollers E R^1 and the folding blade S, and the paste-roller Q', so arranged that the paste is applied to the lap of the bag, substantially as described.

10. The combination of the shaft T and its cranks and guide-pieces with the stationary cam-guides T^1, by which the paste-bar is carried and applied to the paste-roller and the flap of the bag by the reciprocating motion of the shaft T, substantially as described.

134,581.—*Device for Producing Pearl-Finish on Metallic Surfaces.*—BERNHARD D. BEIDERHASE and CHARLES WITTECK, New York, N. Y.—Case A.

The device is attached to the spindle of a lathe and revolved rapidly. The surface to be finished is brought in contact with the wire points, which produces the finish desired. The wire clusters are looped around the pins shown in the head of device, and have an elastic motion.

Claim.—1. A device for producing what is known as satin or pearl finish to metallic surfaces, constructed substantially as shown and described.

2. The recessed head A, with the apertures C', pins E, and clusters of wire D, substantially as and for the purposes described.

3. The combination of the head A and wire clusters D, arranged, as described, with the spindle B, or with the mandrel of a lathe, substantially as set forth.

134,582.—*Device for Producing Satin-Finish on Metallic Surfaces.*—BERNHARD D. BEIDERHASE and CHARLES WITTECK, New York, N. Y.—Case B.

The head carrying the wire clusters loosely attached is revolved rapidly in a lathe or other device, and the metallic surface to be finished brought into contact with the ends of the wires as they revolve, and the desired effect produced.

Claim.—1. An apparatus or device for producing a "satin-finish" on metallic surfaces, constructed substantially as shown and described.

2. The head A, with one or more wire clusters, D, attached thereto, substantially as shown and described.

3. The eyes or loops B, plates C, clusters D, and head A, in combination with a lathe-mandrel, as and for the purposes described.

134,583.—*Vapor-Stove for Heating Soldering-Irons.*—DAVID BERRY, Huntington, Ind.

Claim.—An improved vapor-stove, consisting of the stove A, cover B, oil-reservoir D, pipes F G H, burner I, slotted and flanged disk J, tubes K, and cap L, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purpose set forth.

134,584.—*Machine for Making Shank-Pieces for Boots and Shoes.*—CHARLES H. BLAKE, DAVID D. BLAKE, and FRANCIS M. BLAKE, Worcester, Mass.

Claim.—1. The die or form A constructed to impart the proper shape to a shank-piece, when said shank-piece is bent over said form and trimmed by a single cut of an angular or curved knife, substantially as set forth.

2. The combination, with the form A, of the grooved faced pressure-roll D and trimming-knife C, substantially as and for the purpose set forth.

3. The combination, with the wheel B and dies or forms A, of the pressure-roll D, springs I, cutter C, and adjusting-slide J, substantially as and for the purposes set forth.

134,585.—*Chandelier.*—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place.

The arms can be separately removed without disturbing the remaining portion.

Claim.—The flange A provided with notches *a* and the cap B provided with notches *d*, the arm C constructed with its hooked end *f* to pass through the notch *d*, and lock onto the flange A, in combination with the extension D of the bracket when connected to the spindle above, substantially as set forth.

134,586.—*Cover for Pitchers.*—WALTER BRADLEY, Providence R. I.

A pitcher-cover hung at or near its center on journals, with a preponderating weight attached to it in rear of the journals, by which, when in use, it automatically opens and closes itself.

Claim.—In combination with a pitcher or cup, the self-acting or automatic cover D, substantially as shown and described.

134,587.—*Inkstand.*—WILLIAM M. BROOKE, Eaton, Ohio.

The glass inkstand is semicircular in horizontal cross-section, and is provided with a metallic casing, G, furnished with ears or lugs *b*, by which it is attached to the vertical side of a desk or other object.

Claim.—The combination of the stand D, casing G, ears *b*, and top *f*, said top fastened to the casing by screws *e e*, all constructed and arranged substantially as herein set forth.

134,588.—*Machine for Cutting Sugar into Blocks.*—PETER O. BRUNJES and ALBERT BENNECKENDORF, Hoboken, N. J.

Improvement on Letters Patent No. 132,696. One set of grooving-saws is dispensed with, and the loaf, supported upon a carriage, is fed in a horizontal instead of a vertical plane, the cone-holder revolving on the backward movement of the carriage so as to make the second grooves at right angles to the first, after which the cone is fed to a circular saw, which removes the grooved portion. The feeding of the cone is accomplished by a pawl carried upon a slide, which is forced forward by a cam upon the stationary frame, the pawl engaging with ratchet-teeth upon the stem of the cone-holder.

Claim.—1. The reciprocating carriage G carrying the swivel-plate I, and in the same the laterally-movable sugar-holder *i*, substantially as described.

2. The rod L, connected with the plate I and hung in the carriage G, for the purpose of turning the plate I, as described.

3. The sugar-holder *i* provided with the shank J and combined with the pawl *r*, slide *s*, pin *t*, and cam *v*, to operate substantially as herein shown and described.

4. The plate I provided with the projecting arms *g g*, that serve as a guide and support for the cone-holder *i*, as specified.

5. The combination of the laterally-movable sugar-cone holder with one set of grooving-saws, C, and with one detaching-saw, F, substantially as described.

6. The process, herein described, of cutting sugar into blocks by one set of grooving-saws, C, and one detaching-saw, F, and by turning the said cone previous to each movement of the same toward the grooving-saws, as specified.

7. The cams a^3 connected with the spirally-grooved rollers b^3 and combined with the sugar-cone holder *i*, to be operated by the same, substantially as described.

8. The slide *z* carrying double wedges and a pin, *t*, and applied to the shank J of the sugar-cone holder, as described.

9. The cone-support d^2 arranged on the arm e^3 of the sugar-cone holder, when said arm is provided with an inclined slot, as specified.

134,589.—*Magazine Fire-Arm.*—ANDREW BURGESS, Hartford Conn.

The magazine is loaded by inserting the cartridges into an opening in the side of the bed-piece. This opening is provided with a spring-slide, which is closed by the reaction of a spring contained in a groove in the bed-piece, protected by its cover.

Claim.—1. The forward part *a* of the jointed breech-block, combined with and guided by the sliding cover *b*, to which it is attached, substantially as described.

2. The combination of the elliptical curve *f* with the rear termination of the opening in the bed-piece, and the shoulder *g*, as a means of operating the breech-block, as set forth.

3. The bent lever *l*, when operated by the projection *m* and combined with the carrier-block B, in the manner and for the purpose described.

4. The sliding cover S, when combined with the spring *t* and loading-aperture of a magazine-gun, in the manner and for the purpose set forth.

134,590.—*Corn-Husker.*—JOHN M. CARLISLE, Sumter, S. C.

The sliding sash has a knife and a claw for stripping the ear of corn in proper position; a spring lever-holder to keep the ear in position while separating the stem from the same by means of the knife; and a sliding block having spring-fingers with cutting-points to slit the husks on the ear as the block is drawn backward by means of levers operated by the sliding sash.

Claim.—1. The combination of the stop-claw E with the sash B that carries the knife D, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the sliding block M, spring-fingers N, and points or cutters O with the claw E, and knife-sash B, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the hinged bars J K L with the knife-sash B and sliding head-block M, that carries the spring-cutter fingers N O, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the spring-lever holder G H I with the knife-sash B, stop-claw E, and spring points or cutters N O attached to the sliding block M, substantially as herein shown and described, and for the purpose set forth.

134,591.—*Pruning-Shears.*—OSCAR CHASE, Rutland, Ohio.

One arm of the shears has on its upper end a hook for securing the bough to be cut. A curved guide extending around the pivotal point, and united to the main arm of the shears, carries a cam-faced cutter, which is pivoted within the curved guide at a point near its center. The lower end of the cutter is united to a link, which link is joined to the main arm below the pivot, and furnished with a curved finger which works against a stop-pin arranged to aid in producing a draw-cut.

Claim.—The combination of the lever A provided with a hook, a^1, guide-arm a^2, and stop or projection a^3, the handle B, the cutter C, and the bar, arm, or link D, having a slot, d^1, formed in its inner end and provided with a finger or cam, d^2, said parts being constructed and operating substantially as herein shown and described, and for the purposes set forth.

134,592.—*Cotton-Press.*—PETER K. DEDERICK, Albany, N. Y.

Claim.—1. A baling-press in which the sack for each bale is combined with the pressing devices during the process of forming the bale in such manner that the compressing and sacking are accomplished simultaneously and by the same operations, substantially as specified.

2. The combination, with the press-case C and the sack, of a press-arm-holder for the sack, substantially as specified.

3. The combination of a movable press-head and a friction-brake with the press-case and follower, substantially as specified.

134,593.—*Chair Seat and Back.*—WILLIAM T. DOREMUS, New York, N. Y.

Rigid and elastic blocks are combined together with flexible connections, so as to form a spring-seat or back.

Claim.—The combination of the rigid blocks, elastic blocks, and flexible connections, substantially as shown and described, for the purpose specified.

134,594.—*Car-Axle Box.*—HERMAN G. DOWNS, Seneca Falls, N. Y.

The weight of the car rests upon rollers, which are placed in the journal-boxes so as to bear vertically upon the journals. Cheek-plates are dovetailed into the sides of the journal-box to sustain all lateral strain upon the axles. An oil-box is attached to the journal-box, from which the roller and journal are lubricated by means of the oil passing from the oil box through a groove in the axle of the roller.

Claim.—1. The roller *b* supported upon an axle-bolt, *c*, having a hole, 4, leading from the oil-box to the groove that is upon the under side of said bolt *c*, in combination with the journal and the box, [illegible] as set forth.

2. The cheek-plates *a* secured within the journal-box at the sides of the journal, substantially as and for the purpose [illegible] and described, and for the purpose set forth.

134,595.—[illegible], substantially as shown and described, for the purpose [illegible] with a furnace which heats the hollow [illegible]. The [illegible] which [illegible] and [illegible], N. Y.

The weight of the car rests upon rollers, which are placed in the journal boxes so as to bear vertically upon the journals. Cheek-plates are dovetailed into the sides of the journal-box to sustain all lateral strain upon the axles. An oil-box is attached to the journal-box, from which the roller and journal are lubricated by

wardly near the track, and are so arranged as to be connected at their ends, to form an unbroken side the length of the train.

Claim.—1. A ram for tunneling snow on railroads, consisting of the heated hollow tapering head A and vertical-sided and top-rounded body B C, provided with suitable heating apparatus, the former extending to the top of the latter, and laterally a little beyond the body, as and for the purpose described.

2. The furnaces G G and the surrounding chamber J with its air inlet and outlet pipes K L arranged in connection with the hollow head A, as and for the purpose described.

3. The smoke-stacks M, hinged and folding under cap N, as and for the purpose described.

4. The overlapping plates S and springs T arranged between the platforms of two adjacent cars, as and for the purpose described.

134,596.—*Machine for Jointing Staves.*—SOLOMON S. GRAY, Boston, Mass.

An endless traveling platform is provided with forms, upon which the staves are placed while passing between revolving cutters, the forms acting as guides to the cutters.

Claim.—1. In an organized machine for jointing staves, an endless-chain feed-bed, having secured thereon one or more pattern-forms by which the position of the cutters is controlled to give the proper curvature to the edge of the stave, substantially as described.

2. In combination with an endless chain feed-bed having one or more pattern-forms secured thereon, the cutter heads J J, arranged and operating as herein described, for the purpose specified.

3. In combination with an endless-chain feed-bed having one or more pattern-forms secured thereon, the pivoted adjustable shoe *b*, attached to the cutter-frame, substantially as described, for the purpose specified.

4. In combination with an endless-chain feed-bed having one or more pattern-forms secured thereon, the yielding pressure-bar L, arranged and operating substantially as described, for the purpose specified.

5. The combination of the chain feed-bed C having one or more pattern-forms, E E, secured thereon, the revolving cutter-heads J J placed opposite each other, on either side of said bed and mounted upon sliding frames F F, the adjustable pivoted shoes *b* attached to said frames and working in conjunction with the curved edge of the former E to control the position of the cutter-heads, and the levers *d* and the weight G for holding said cutters to their work, substantially as herein set forth and described.

6. In combination with an endless-chain feed-bed having one or more pattern forms secured thereon, the guide-plates D D, provided with a tongue on their inner edges to fit a corresponding groove formed in either edge of said feed-bed, for the purposes and in the manner herein set forth and described.

7. The combination of the frame F, the bar *e* made in two parts, and the wedge *f* interposed between said parts for the purpose of expanding said bar to vary the position of the shoe *b* with relation to the cutter-head, substantially as described.

134,597.—*Machine for Crozing and Chamfering Staves.*—SOLOMON S. GRAY, Boston, Mass.

The stave-carriers are provided with yielding beds, and the knives upon the cutter-heads are constructed so as to produce a drawing-cut.

Claim.—1. In a machine for finishing the ends of barrel-staves, a rotary feed-cylinder mounted in fixed or rigid bearings, and provided with the yielding followers *j j* arranged on its periphery to support the stave, in combination with the guide and gage bars L, arranged and operating as described, for the purpose specified.

2. The cutters *c*, *d*, and *g* formed and arranged on inclined surfaces on the cutter-heads *a* and *b*, that that portion of the cutting-edges of said cutters which describes the smallest circle shall strike the wood first and give a drawing cut, substantially as described.

134,598.—*Pole-Clamp.*—HENRY HARRING, New York, N. Y., assignor to himself and HERMANN ALLIS, same place.

To clamp the pole-splice together, the yoke is put around the pole and the eccentric lever is put in its bearings as near to the poles as it can be with the handle raised, so that the lowest part of the eccentric head will be next to the pole. The handle is then forced downward, and is secured by the chain or a cord passed around the poles and engaged to a hook.

Claim.—A pole-clamp, consisting of the yoke A with notches G, the eccentric lever B D with journals H, and a binding chain or cord, E, all combined and arranged substantially as specified.

134,599.—*Apparatus for Filling, Polishing, and Varnishing Moldings.*—MAX HAMBURGER, ISAAC J. SISKIND, and ACHILLE KLEIN, New York, N. Y.

The molding rests upon a table which is raised by racks and pinions. A brush, having a hollow handle for the transmission of the varnish and a spiral spring for adjustment, is secured by a bracket to a traveling trough placed over the table. The trough is moved by cords passing over pulleys, and at either end of its travel strikes a lever which operates a clutch and other reversing mechanism.

Claim.—1. The combination of the [illegible] arm G, gear-wheels [illegible] shaft [illegible] clutch-sleeve [illegible] lever [illegible] pulleys [illegible] cords [illegible] and [illegible] substantially as and for the purpose set forth.

2. The combination of the [illegible] with the [illegible] and [illegible] substantially as described, and for the purpose set forth.

134,599.—*Apparatus for Filling, Polishing, and Varnishing Moldings.*—MAX HAMBURGER, ISAAC J. SISKIND, and ACHILLE KLEIN, New York, N. Y.

The molding rests upon a table which is raised by racks and pinions. A brush, having a hollow handle for the transmission of

receiving and carrying the brushes or rubbers S T, in combination with the adjustable table B, substantially as herein shown and described, and for the purpose set forth.

4. The hollow stem S and spring W for conveying the liquid to the brush or rubber, and for holding the said brush or rubber down to its work with an elastic pressure, in combination with the bracket or holder U, substantially as herein shown and described.

5. The combination of the trough P, provided with stop-cocks Q, with the moving bar V, hollow stems S, and brushes or rubbers T, substantially as herein shown and described, and for the purpose set forth.

6. The arrangement of the cords Z, guide-pulleys A', wheels or drums B', shaft E', loose pulleys F', clutch K', straight and crossed belts G', pulleys H', and driving-shaft I', with respect to each other, to the moving bar V and frame A, substantially as herein shown and described, and for the purpose set forth.

7. The combination of the connecting-rod M', armed shaft O' N' P', sliding rod Q', levers R', and arm S' with the moving bar V, frame A, clutch-lever L', clutch K', and loose pulleys F', substantially as herein shown and described, and for the purpose set forth.

8. The combination of the hand-lever T' with the sliding rod Q', armed shaft O' N' P', connecting-rod M', clutch-lever L', clutch K', and loose pulleys F', substantially as herein shown and described, and for the purpose set forth.

134,600.—*Stopper for Volatile-Salts Bottles.*—ALONZO HEBBARD, New York, N. Y.

A hollow screw-cap, having fitted therein a perforated diaphragm and a plug of rubber or leather to close the mouth of the bottle when screwed down upon it.

Claim.—The combination of the bottle A with the screw-cap E, having a diaphragm, G, therein, made as described, and all arranged and operating as set forth.

134,601.—*Manger for Horses.*—JOSEPH C. HIGGINS, Millstone, N. J.

A manger is pivoted at each end; is provided with a weight underneath to keep it upright. In front and near this freely-moving manger a transverse rod is arranged, the whole being intended to prevent horses from "cribbing."

Claim.—1. A horse-manger, supported on pivots and weighted at the bottom so that it will be self-adjusting, substantially as shown and described.

2. In combination with a manger constructed as above described, the rod B, as and for the purposes set forth.

134,602.—*Chromatic-Printing-Press Attachment.*—EDWARD A. HOWITT, Whitewater, Wis.

Straps are secured to the ordinary distributing-disk, which latter is given a vibrating motion to evenly distribute the color.

Claim.—The series of detachable straps B arranged in a printing-press parallel to each other and upon a vibratory plate, as described, and for the purpose specified.

134,603.—*Coffee-Pot.*—EDWARD HEINSON HUCH, Brunswick, Germany.

A steam-chamber is formed by the long flange of the cover. When the cover is raised by the steam the connecting-rods and levers operate to extinguish the lamp.

Claim.—1. The lid D, made up-and-down adjustable, and dipping into an annular water-space to close tight the vessel it covers, as set forth.

2. The up-and-down adjustable lid D, connected with the lamp-closing or wick-adjusting devices to regulate the flame automatically, as specified.

3. Such construction of pots for making coffee and other infusions that when the pressure of the steam raises the water from a lower to an upper vessel the water acts upon a float, and in so doing gives motion to instrument which extinguishes the flame, substantially as described.

134,604.—*Tongs for Lifting Fruit-Cans.*—ALBERT H. JOHNSON, Bridgeport, Conn.

A pair of handles pivoted together, each handle extending into two legs, and their ends turned inwardly at nearly right angles in the form of feet.

Claim.—The tongs herein described, consisting of the handles A B, pivoted together, each handle terminating in a pair of legs, *a d*, and the legs provided with internally-projecting feet, substantially in the manner and for the purpose herein described.

134,605.—*Automatic Fan.*—WILLIAM LAWRENCE and JOSEPH SANDERS, New Albany, Ind.

The fan-frame can be set at any point within about three hundred degrees by circular plate-rings, notched on the inner edge to engage a double-spring latch.

Claim.—1. The jointed fan-frame C and circles L L, in combination with the stands B B and bed A, as and for the purposes set forth.

2. The stop-levers N N and spring Q, in combination with the fan-frame C and circles L L, as and for the purposes described.

134,606.—*Thread-Waxing Attachment for Sewing-Machines.*—CLAY E. LEWIS, York, Pa.

The wax in the cup is kept warm by the water in its outer casing, heated by the heater or lamp, and the lamp also keeps the horn warm.

Claim.—The arrangement of heater C with waxing attachment and horn so that the former heats both, substantially as specified.

134,607.—*Wash-Board.*—JOHN T. MCNALLY, Brooklyn, and FRANK T. MCNALLY, East New York, N. Y.

On the large corrugations smaller corrugations or ribs are made, running longitudinally thereon.

Claim.—A wash-board with a surface of sheet metal in which there are small ribs running longitudinally of the corrugations or undulations, for the purposes set forth.

134,608.—*Bayonet Attachment.*—JAMES W. NEIL, Brooklyn, assignor to himself and EDWARD SIMPSON, Glencove, and JOHN W. WILSON, New York, N. Y.

Claim.—The spring-lever *c*, with a latch, *r*, at one end and a thumb-piece, *s*, at the other end, in combination with the cylinder *b* of the bayonet and the raised portion *t* surrounding such thumb-piece *s*, as and for the purposes set forth.

134,609.—*Washing-Machine.*—AMANDRIN M. OLDS, Greeley, Col. Ter.

A tub with vertical revolving shaft, to which is attached a circular disk with screw-formed rollers and radial arms, and operating arms.

Claim.—An attachment for wash-tubs, consisting of the circular disk A, screw-rollers C, and radial arms I and handles D, when combined to operate substantially as set forth.

134,610.—*Adjustable Grain-Wheel for Harvester-Platforms.*—GEORGE M. PATTEN, Auburn, N. Y.

Claim.—The flanged plate C provided with two sets of ratchet-teeth, E, pawls F, springs G, pivoted stems H, and flanged block D, in combination with each other, substantially as herein shown and described, to adapt them for attachment to a harvester-platform, as and for the purposes set forth.

134,611.—*Lubricator.*—JOHN MCLURE POWER, Port Discovery, Washington Territory.

Claim.—A lubricator having a neck, A; reservoir B, oil-chamber C; condenser F and spindle H, cock G, branch E, pipe D, valve-spindle J, and plug I, when the same are arranged substantially as and for the purposes described.

134,612.—*Door-Check.*—GEORGE ROHRBAKER, Penn Station, Pa.

A circular metallic plate, bearing a circular cavity or opening, forms part of a frame which is attached to the casing and arranged concentric with the door-hinges. There is also on the door another suitable plate holding a block of rubber a little wider than the cavity or groove, and working in it, whereby the swinging door is held by friction in the desired position.

Claim.—A metal piece, D, having a circular cavity, H, and attached to casing B, in combination with the rubber block I attached to plate J, and made a little wider than the breadth of said cavity H, as and for the purpose described.

134,613.—*Music-Portfolio.*—FRANK C. SCHUMANN, New York, N. Y.

The spring-back C clamps the sheet of music securely within the book while used as a portfolio, and serves, also, as a ledge to support the lower edge of the sheet, while one back of the portfolio is supported upon the hinged bracket D, to serve as a music-rack.

Claim.—The combination of a bracket, D, with the spring back C and side plates A B of a music-portfolio, in such a way that it may support one of said side plates in an inclined position to adapt it to serve as a music-rack, and may be turned down out of the way when not required for use to allow the portfolio to be closed, substantially as herein shown and described.

134,614.—*Spring Bed-Bottom.*—JOHN L. SECOMB, Chicago, Ill.

The bed-bottom is formed of two longitudinal slats and four transverse slats, secured together by screws. Conical springs at the corners. On these rest two transverse bars. To these are attached, by hooked screws, several spring-slats having stiffeners on the under side. There are also slats running diagonally.

Claim.—A spring bed-bottom, wherein the slats A, screws B, slats or bars C C', springs D, bars E, spring-slats F, stiffeners G, and diagonal spring-braces H, are arranged substantially as set forth.

134,615.—*Cultivator.*—JAMES SHERRILL, Harrisburg, Oregon.

A series of plow-beams in a frame pendent to a main frame on wheels. The beams have independent vertical motion only. Clevis attached to front point of lower frame, where it is suspended, rods from which lead back to the axle-tree. At the back of the seed-box, which lies along the axle-tree, there is a rod attached to a bell-crank lever, which latter has another rod with a forked end for throwing the agitator-shaft out of gear with the running-wheels. The same movement, by an attachment to a slide intended to cover the openings in the bottom of the box, accomplishes the object.

Claim.—1. The forked or clutch rod Y, cross-head lever B', spring-rod C', arm H', and catch I', in combination with the seed-box T, gear-wheel W, sliding plate G', and roller M, substantially as herein shown and described, and for the purposes set forth.

2. The draft-frame E, pendent from stationary frame and axle, and having the plow-beams pivoted thereto, as and for the purpose described.

134,616.—*Street-Car Coupling.*—JOHN STEPHENSON, New York, N. Y.—Case E.

Claim.—In a street-car having a draw-bar, A, with jaws B C and pin D, I claim the rod F, the same being a rigid extension of the pin, and being provided with shoulders *g i*, spring G, and handle for the driver, all constructed and arranged to operate as set forth.

134,617.—*Butt-Hinge.*—ISAAC L. THOMPSON, Sardis, Ohio.

A butt-hinge is provided with extra arms or straps working loosely on the pintle, which arms are attached to the wood of the door or casing about at right angles with the leaf of the hinge. These arms have formed on the inside a drive-lug or pin, which, driven into the wood, saves one screw, the whole strengthening the construction and diminishing liability of the hinge to get loosened under heavy weight or rough usage.

Claim.—The combination, with the leaves A A and pintle C of the hinge, of the arms E provided with the lugs G, as and for the purpose specified.

134,618.—*Mode of Utilizing the Currents of Rivers.*—ELIE VALADE, Memphis, Tenn.

Claim.—1. The abutments A C, converging toward a screw, *w*, which is applied in a wheel-house, D, substantially as and for the purposes described.

2. The guard B, combined with the abutments A C, the latter one being below or on a level with low-water mark, substantially as and for the purposes described.

134,619.—*Metallic Fabric for Scouring and Percolating Purposes.*—ANDREW J. VANDEGRIFT, Covington, Ky.

Fabric built up of plates of sheet metal laid in rows, and secured together by transverse rods.

Claim.—A metallic fabric for scouring and percolating purposes, composed of suitably-united tiers or rows of slips or plates of sheet metal, arranged in parallel planes with intervening spaces, substantially as specified.

134,620.—*Paddle-Wheel.*—THOMAS G. WALKER and HENRY H. HOLBROOK, New York, N. Y.

Buckets or floats, swung upon their vertical edges to vertical shafts, rotate freely upon their axes, and are controlled in their revolution and caused to rotate by stationary stops securely attached to the framing of the vessel.

Claim.—The propeller-wheels upon vertical shafts, and made with buckets that swing upon a line, or nearly so, of one of the vertical edges, in combination with the arms *f* and stationary stops *g*, substantially as and for the purposes set forth.

134,621.—*Crimping and Fluting Machine.*—ROBERT WERNER, Hoboken, N. J.

Portions of the rollers are toothed for fluting; the remainder has smooth surfaces. A platform is placed in front of the rollers, and has a small pressing-finger or detent which bears upon and draws the fabric back into crinkles or folds as it passes along the platform to be introduced between the rollers. As it emerges from the rollers in the rear two pressers bear the fluted portion down upon the lower roller, while a projecting tongue underneath the crimpled part pushes that portion up into a puff.

Claim.—1. The detent D arranged, in combination with the fluting-rollers B B, to produce the crinkles or puffing on the fabric which is partially fluted, as set forth.

2. The platform C or C' arranged, in combination with the detent D and rollers B, as specified.

3. The check-pieces *f* in the plate E, applied in conjunction with the projecting rib *g*, to the fluting-rollers B B, as specified.

134,622.—*Pavement.*—MILTON E. WORRELL, Monmouth, Ill.

A cellular iron frame with longitudinal and transverse flanges and straining-rod below, pyramidal wooden blocks above, and elastic packing between contiguous frames.

Claim.—An improved combined iron and wood pavement formed by the combination of the perforated cellular iron plates A, edge flanges C, cross-flanges D, stay-rods E, wooden blocks B, and rubber or other elastic packing F with each other, substantially in the manner herein shown and described, and for the purpose set forth.

134,623.—*Baby Carriage.*—CHARLES H. AMIDON, Miller's Falls, Mass.

The handle is adjusted by its having a ribbed plate secured to one end, which engages with a plate on the side of the body. This plate has corresponding grooves, both being fixed by means of a thumb-screw. The seat is so arranged that it may form a bed.

Claim.—1. In combination with the carriage-body A, the blocks D E having concentric grooves *e* and corresponding ribs *d*, and the ball-handles B, adjusted by the thumb screws F, substantially as herein set forth.

2. In combination with the carriage-body A, the blocks D E having concentric grooves *e*, with a stop or stops, *g*, and corresponding ribs *d* having transverse serrations *f*, and the ball-handle adjusted by the thumb-screws F, substantially as herein set forth.

3. In combination with the carriage-body A, the springs S, bolster T, and the rear axle U, joined to said bolster at its center, as and for the purpose set forth.

4. The seat V, constructed with the front flap hinged thereto and combined with cleats *r*, as set forth, so that said seat may be converted into a bed, in the manner described.

134,624.—*Adjustable Picket Fence.*—JOHN S. ANDERSON, Flintville, Wis.

The horizontal bars bearing the pivoted palings are supported by double hooks attached to the post. The loops which secure the bars to the hooks are pivoted to the bars to give complete adjustability.

Claim.—The pivoted loops E attached to the horizontal bars D, as described, in combination with the post A having the double hooks B and pivoted palings C, substantially as specified.

134,625.—*Lifting-Jack.*—WILBUR F. ARNOLD, New Britain, Conn.

Claim.—1. The combination of the standard A and sleeve D, with the toggle-joint formed by the levers F G, all substantially as and for the purpose described.

2. The combination of the two movable and adjustable sleeves D D', rack *b*, pawl *c*, levers F G, and standard A, all operating together substantially as and for the purpose described.

134,626.—*Pump.*—JOHN S. BARDEN, Providence, R. I.

A piston works in a cylinder which is inclosed in an exterior cylinder, divided into interior subdivisions by vertical partitions, forming induction and eduction chambers having perforated valve-seats, upon which an elastic band is arranged to bear.

Claim.—1. The combination, with a piston-pump, of the requisite valve-ports, having a suitable seat or seats, and the elastic band-valve embracing the seat, substantially as and for the purposes specified.

2. The combination of the piston, its cylinder, the including-case divided into induction and eduction chambers, the several induction and eduction valve-ports, and the elastic band-valves E F, substantially as and for the purposes specified.

134,627.—*Railroad-Car Seat.*—ALEXANDER BARNEY, Wilmington, Del.

The seat can be reversed, and the back inclined at any angle.

Claim.—1. A car-seat, consisting of the lower stationary frame and the upper portion or seat B, supported by the frame, and adjustable longitudinally and rotating as specified.

2. The combination, with the sliding frame G, of the inclined guides *b b* of the fixed frame, for the purpose specified.

3. The combination, substantially as described, of the adjustable hinged back F, with the pivoted reversible seat.

4. The combination of the back F, connected to the seat by a double hinged joint, and the curved and notched rods *e*, secured rigidly to the said back, and adapted to pins *h* projecting from the arms of the seat into the paths of the said rods, all substantially as specified.

5. The adjustable cushion B' and its notch *k*, in combination with the projection *l* on the front edge of the seat-frame.

134,628.—*Composition for Forming Stone, &c.*—JOSEPH J. BARTLETT, New York, N. Y.

Treating asbestus, "either ground or in fibers," with silicate of soda or potash, and pressing into molds and saturating with chloride of calcium, and then washing in water.

Claim.—1. A compound obtained by treating asbestus, substantially in the manner herein described.

2. The within-described process of treating asbestus, substantially as and for the purposes set forth.

134,629.—*Car-Coupling.*—JOSEPH W. BATES, Minneapolis, Minn.

The coupling-bar G has shoulders *d* on its rear end which extend half way around it, said shoulders serving to resist impact and draft and as a weight to keep the spear-shaped end *f* in the proper position. The smaller shoulder *d*, extending only half way round the bar G, allows of its being inserted through the bulge in slot *a*. C holds G in a horizontal position.

Claim.—The bumper A provided with the forward notched plate C, inclined walls B B, and slotted plate D, in combination with the coupling G having beveled spear-head *f*, bearing *b* shoulders *d d*, and weight A, all constructed to operate substantially as set forth.

134,630.—*Child's Carriage.*—JOHN A. BECHLER, Philadelphia, Pa.

Claim.—1. A vehicle, as described, convertible into a two or four wheeled child's carriage, or a perambulator, or a sleigh, substantially as herein set forth.

2. The oscillating or pivoted bars B C arranged between the parallel frames, and capable of being turned from a vertical to a horizontal position for supporting the bottom of a wheeled vehicle, or the platform of a sleigh, substantially as herein shown and described.

3. The detachable bottom-board E, provided with one or more jointed sections for forming a dash-board for the child's carriage, or platform for the child's sleigh, as shown and described.

4. In a four-wheeled perambulator or carriage, substantially as described, mounting the rear axle of the wheels in the legs at *o*, or in spring-bearings, as at L, and combining therewith the removable brace rods M M and reach H, as set forth.

5. In a child's carriage or perambulator, as described, the detachable canopy T provided with curtains V and rods U, in combination with the side frames A, the seat P, and bottom-board E, as and for the purpose set forth.

134,631.—*Lantern.*—HENRY BEEBE, Jersey City Heights, N. J.

A deflecting-plate is arranged over the perforated top plate of the burner, for the purpose of directing a portion of the continuous current of air to the burner.

Claim.—1. The deflecting-plate K, arranged about the burner-cap J, in combination with the perforated plate C, substantially as described.

2. The perforated plate C provided with the rising and inwardly-bent flange G to receive the globe I and with the perforated curtain D for supporting the whole upon the lamp, as shown, in combination with the solid deflecting-plate K surrounding the perforated burner J, the whole arranged and operating substantially as described.

134,632.—*Cotton-Cultivator.*—NOAH BELL and HENRY WINFIELD, Pantego township, Beaufort county, N. C.

Two shovel-plows adjustably connected together so that the distance between them may be increased or diminished. To the land-sides are attached outwardly-projecting flanges to clear weeds.

Claim.—1. The construction and arrangement of the bars C *d*' E', land-sides D D', and clip *d*', substantially as specified.

2. The diverging flanged clearers H secured to the land-sides D D' at their forward ends, in combination with the oblique shovels F F', substantially as specified.

3. The slotted, pivoted, and obliquely-arranged shovels F F', saddles E E' and bent standards *d*' E', combined and arranged substantially as specified.

134,633.—*Clothes-Wringer.*—THOMAS O. BOGERT, Cincinnati, Ohio, assignor to THE QUEEN CITY WRINGER COMPANY, same place.

A clothes-wringer with its frame and dripping device or pan cast in one piece, with its sides or uprights covered with a cap, through which passes the regulating-screw, and is held in position by studs projecting upward from its sides. Attached to the sides of the frame covering the journals are upright pieces with projecting flanges, to conduct the clothes to the rolls.

Claim.—1. The journal-box cap A', constructed as shown, and provided with the stud *a*', in combination with the post A provided with the opening *a* and with the screw *a*'', substantially as and for the purpose specified.

2. The side pieces or posts A, legs C, and dripping-pan B, when constructed of or from one piece of metal in the form shown, substantially as and for the purpose set forth.

3. The cross-bar L provided with the tenons *l*, and combined with the posts A by means of the divided sockets M, substantially as and for the purpose shown.

4. The device as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose shown and described.

134,634.—*Feed-Water Heater.*—HENRY F. BOODY and EDMUND P. MERRILL, Portland, Me.

Two reservoirs, conforming to the shape of the smoke-arch, are connected by pipes and placed in the said smoke-arch, so that the feed-water is heated by the fire instead of the exhaust steam, as heretofore.

Claim.—The combination, with the smoke-arch of a locomotive, of the reservoirs *a a'*, pipes *d c e*, and coupling *f* to form a feed-water heater, when constructed and arranged substantially as set forth.

134,635.—*Steam-Generator.*—JOHN W. BOOKWALTER, Springfield, Ohio.

Claim.—The combination, in a steam-generator, of a series of cast-metal tubes and tube-sheets, the latter being also of cast metal and cast in one piece with the tubes, and a wrought-metal shell, the parts being constructed and arranged substantially as and for the purpose set forth.

134,636.—*Apparatus for Electric Measurement.*—LEVERETT BRADLEY, Jersey City, N. J.

Needle made of thin disk of steel and provided with aluminium pointers. Under needle are four distinct coils, of width greater than diameter of needle and of different resistances. Series of rheostats of different resistances arranged to be connected to either galvanometer coil. Switch arranged to bring either rheostats or the unknown resistance into circuit. Unknown resistance being in circuit, deflection of needle is noted. By switch it is cut out and rheostats introduced, enough being unplugged to cause same deflection.

Claim.—1. The galvanometer-needle, composed of a single circular plate, substantially as specified.

2. The combination, with the circular plate or disk-needle C, of one or more galvanometer coils of greater width than said needle, when such coils are arranged substantially as specified, and whereby the current passing through them is made to run parallel with the meridian of the needle.

3. The combination, with the rheostat, of the switch K, arranged so that the battery-current may be directed at pleasure through the rheostat or the conductor, the resistance of which requires to be measured, essentially as described.

4. The combination of any number of resistance-coils, H' H² H³ H⁴ of the rheostat, the switch K, points L L', the screw-cups I II III IV, the galvanometer A, and battery J, with their connections, essentially as described.

134,637.—*Bag-Holder.*—JAMES B. BROWN, Washington, D. C.

Ring made in two parts and supported upon a tripod, so that it can be adjusted to suit bags of different width.

Claim.—The within-described bag-holder, consisting of the platform A, tripod B B B, the rim C D, made in two parts, with headed rivets *a a*, slots *b b* and *a a*, and thumb-nuts *d*, all constructed substantially as and for the purposes set forth.

134,638.—*Collar.*—JOHN T. BRUEN, Brooklyn, N. Y.

The collar has two gores cut from the band, one on each side of the central button-hole, and these gores are turned over and pasted down to form the end lapels.

Claim.—1. A collar formed with gores in the neck-band on either side of the central button-hole of the collar, substantially as specified.

2. A collar having its lapels cut from the edge of the neck-band in such manner as to leave gores in the latter, substantially as specified.

134,639.—*Medical Compound for Cure of Fever and Ague.*—WALTER CAMPBELL, Camden, N. J.

Quinine, spirits niter, turpentine, vitriol, red pepper, sulphur, rye whisky, oil of stone.

Claim.—The compound composed substantially of the ingredients herein named, for the purpose set forth.

134,640.—*Brake for Elevators.*—FELIX P. CANFIELD, Boston, Mass.

Hanging the brake-shoe upon a swinging arm, which is pivoted upon an eccentric and operated by a lever, so that if the lever is depressed the shoe will be pushed away from the wheel.

Claim.—The combination of the brake-arm E with the stop S, eccentric H, and lever L, operating substantially as described, and for the purpose set forth.

134,641.—*Clothes-Wringer.*—RODNEY S. CATHCART, Cincinnati, Ohio, assignor to himself and THE QUEEN CITY WRINGER COMPANY, same place.

A clothes-wringer cast with hollow cylindrical sides or uprights, and in which the journal-boxes, being previously prepared and inclosed in the core, are cast within the upright cylinder. On top of the sides, secured in slots, is a cross-bar with its tenon and wedges, and thumb-screw to give tension to the rolls through the agency of the elliptical spring with forked ends resting upon the journal-boxes. A metal dripping-pan acts also as a brace to strengthen the frame.

Claim.—1. The top cross-bar C having the form shown, and provided with the dovetailed tenons *c*, in combination with the posts A provided with the mortises *a* and with the wedges *c'*, substantially as and for the purpose specified.

2. The dripping-pan G, constructed as shown, and combined with the posts A provided with the grooves *g*, substantially as and for the purpose shown.

3. The combined posts A and legs B, when constructed substantially as and for the purpose set forth.

4. In a wringer having a metal frame, a movable journal-box cast within and not detachable from the frame-post, substantially as and for the purpose shown and described.

5. In combination with the upper or movable journal-box I, and with the slotted frame-post A, the stud *i* secured upon and extending upward from said box, substantially as and for the purpose specified.

6. The hereinbefore-described device as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose shown.

134,642.—*Gearing.*—ERNEST G. CHORMANN, Philadelphia, Pa.

A disk or head plate having curved flanges thereon, the pitch of which increase irregularly from the outer end to the inner, and are not uniform in width, but engage regularly with a series of rollers upon the periphery of the wheel operating the main shaft.

Claim.—The device composed of the head-plate E and the flanges C, one or more in number, having the peculiar curvature described, substantially as and for the purpose set forth.

2. The rollers *e* mounted upon pins *f*, in combination with the device E C, constructed substantially as and for the purpose described.

134,643.—*Fanning-Mill.*—GREVILLE E. CLARKE, Kenosha, Wis.

Hopper constructed of removable pieces let into grooves in sides of frame. Wind-board and apron connected at ends by triangular pieces. Sieves so arranged that part of grain from second falls past third. Fan-case attached to frame by slotted metallic hooks, which also serve as handles. By various cranks and pins the two shoes may be reciprocated in same or opposite directions.

Claim.—1. In combination with the grooved sections A of fanning-mill sides, the pieces G and S S, constructed as shown and described, and the slide H to form the hopper, as herein set forth.

2. The wind-board L and apron M, connected at the ends by triangular pieces *a a*, and forming a recess between their front edges, the apron also projecting beyond the wind-board and triangular pieces, all substantially as and for the purposes herein set forth.

3. The sieves N¹ N² N³ in the shoe K arranged, substantially in the manner shown, so that a part of the grain will fall through the second sieve N² past the third sieve N³, as and for the purposes herein set forth.

4. The metallic handles *p* provided with slots at their inner ends for the purpose of hooking the head of a fanning-mill onto the post or its equivalent, substantially as herein set forth.

5. The arrangement of the pinions *b' f'*, rods *a' k' d'*, and cranks A' B', substantially as and for the purposes herein set forth.

6. The pivoted plate *h'*, for the purposes herein set forth.

134,644.—*Refrigerator.*—SAMUEL E. CONDON, Brooklyn, E. D., N. Y.

A sink is combined with a refrigerator having a double wall with an intervening water-space, which space is provided with partitions that are alternated in position for directing the water as it flows around the refrigerating-chamber to the induction-pipe—then to the sink.

Claim.—1. The water-vessel around the refrigerator, in combination with the sink or basin upon such refrigerator, and the faucet connected with the water-vessel, substantially as set forth.

2. The sink or basin permanently connected with and supported by the refrigerator, as a new article of manufacture.

134,645.—*Railroad-Car Spring.*—JOHN W. CULMER, Pittsburg, Pa., assignor of three-fourths his right to C. J. CLARKE, G. R. EDWARDS, and ANDREW HOWARD, same place.

A spiral spring surrounds telescoping-cylinders, which have tongues and grooves slanting differentially to the pitch of the spring to secure both direct and torsional resistance. Within the lower cylinder is incased an air-tight sack filled with air compressed of two or more atmospheres. The springs are prevented from spreading at top and bottom by projections on the flanges of the cylinders.

Claim.—1. The combination of the flanged telescoping-cylin-

ders *a* and *b* having grooves and tongues oblique to their axes, substantially as described.

2. The combination of a spiral circumscribing spring with male and female telescoping-cylinders, tongued and grooved differentially to the pitch of the spring, substantially as and for the purpose set forth.

3. The combination of stops P P' upon oblique tongued and grooved male and female cylinders with a coiled spring, as and for the purpose set forth.

4. The inclosed fixed air spring or case K fitted with a superposed cylinder, substantially as and for the purpose described.

5. The combination of compressed-air spring with telescoping-cylinders, an intervening metallic plate or head, and external spiral spring, whether the cylinders are grooved and tongued or not, as and for the purpose specified.

6. The central pivot-boss L for the upper telescoping-cylinder, as and for the purpose described.

7. The railway-car spring having all its parts constructed and arranged for joint operation, substantially as described.

134,646.—*Car-Spring.*—JOHN W. CULMER, Pittsburg, Pa., assignor of three-fourths his right to C. J. CLARKE, G. B. EDWARDS, and ANDREW HOWARD, same place.

Claim.—A compound spring composed of two or more separate spiral springs of the same pitch intercoiled upon a common diameter or the same plane, substantially as and for the purpose set forth.

134,647.—*Ash-Lifting Shovel.*—GEORGE W. DEAN, New York, N. Y.

Claim.—1. A sifting-shovel having flexible wires D with their ends hooked into holes *c c'* of body C, as and for the purpose described.

2. The series of holes *c c'* in body C of shovel to admit of wires being placed therein at different distances apart, according to the grade of coal used.

134,648.—*Car-Coupling.*—JOSEPH L. DE GOOD, Jefferson, Pa.

The coupling-pin in an adjoining draw-head is held or released at will.

Claim.—The buffer A provided with the recess B, in combination with the bifurcated lever I, the forks of which are provided with the slots J J and shoulders K K, and the spring D provided with the curved point and cross-piece G, arranged relatively one to the other, substantially as and for the purpose hereinbefore set forth.

134,649.—*Nut.*—FRANK L. DELFER, Burlington, Iowa.

The nut is made of less lateral dimension toward its center than at either end, to allow the jaws of a properly-formed wrench to fit over and be securely held while the nut is being turned.

Claim.—A screw-nut constructed with its front greater in lateral dimensions than its central or rear portions, substantially as and for the purpose set forth.

134,650.—*Scroll-Saw.*—WILLIAM H. DOANE, Cincinnati, Ohio, assignor to J. A. FAY & CO., same place.

The saw is strained by the action of a rubber spring confined between disks, and operating upon the shaft of a segmental pulley, to which the saw is attached.

Claim.—1. The segment-pulley recessed rock-shaft G, in combination with the spring M and its attachments, when constructed and operated in the manner and for the purpose shown and described.

2. The herein-described housing E, combined with the recessed and slotted stanchion A, and containing the entire saw-straining devices G H L M N, in the manner and for the purpose set forth.

134,651.—*Hydraulic Engine.*—ROBERT F. DOBSON, Belmont, Wis., assignor of one-third his right to GEORGE FROST, same place.

The pipes being full of water and the valves closed to prevent the water from passing down through the tubes to the cylinder, the rod is uncoupled from one of the valve-cranks and the valve opened. The rod is then replaced. The water now passes the open valve, enters the cylinder through the tubes, expelling the air and closing one of the main valves, besides one of the valves which open into the cylinder from the side. The water then comes in contact with the piston with a force and momentum in proportion to the height of the water in the pipes.

Claim.—1. The horizontal connecting-pipe B, in combination with the vertical pipes A of a hydraulic engine, substantially as set forth.

2. The vertical water-pipes A, horizontal cylinder H, valves C, connecting-rod b, piston G', and slotted connecting-rod F, combined, substantially as specified.

3. The bent tubes A, in combination with the pivoted valves C, vertical tubes A, and piston-cylinder H, substantially as specified.

4. The valves I I and balanced or pivoted connecting-rod J, in combination with the cylinder H and piston G, substantially as described.

134,652.—*Stench-Trap.*—PATRICK W. DOHERTY, Boston, Mass.

This trap is provided with an inlet at its lower end and an outlet at its upper end and a bell-shaped opening at its top, formed so as to leave a packing-seat between the stopper and the shell of the trap. A recess is formed in the under side of the stopper to receive the packing.

Claim.—The stench-trap A formed with the bell-shaped opening D and packing-seat *g*, in combination with the screw-stopper B, joint *f*, and inlet and outlet orifices E C, the several parts being constructed and arranged as herein shown and set forth.

134,653.—*Saw-Mill Dog.*—HENRY D. DONN, Oshkosh, Wis.

The dogs enter the wood in opposite directions, thus drawing up and holding the timber securely against the knee of the head-block.

Claim.—1. The bars B B provided with interlocking knives *d d*, and operating substantially in the manner and for the purposes herein set forth.

2. The combination of the box or case A, bars B B with interlocking knives *d d*, inclined slots *b b*, pins *a a*, connecting-bars C C, cross-head D, and lever E, all constructed and arranged substantially as and for the purposes herein set forth.

134,654.—*Suction-Hose.*—WILLIAM C. DOWNS, Providence, R. I.

The stiffener is made of two spiral bands which engage each other by means of inward and outward flanges.

Claim.—1. The combination, within a suitable suction-hose, of two flexible spiral stiffeners, composed of sheet metal, having corresponding spiral lines, and located one within the other, substantially as described, whereby the section of hose will have the desired flexibility, a proper foundation, and present in the waterway a continuous metallic surface whether the hose be straight or bent, as and for the purposes specified.

2. Annular or spiral metallic suction-hose stiffeners, composed of an inner and an outer series, arranged to match joints, and provided respectively with outward and inward projecting flanges *c b*, as and for the purposes specified.

134,655.—*Apparatus for Treating Cane-Juice with Sulphurous-Acid Gas.*—JOHN DYMOND, New York, N. Y.

The gas from the generator passes through the cooling-worm and into and up through the descending liquid in the upright column. The upward flow of the gas is induced and accelerated by a steam jet or exhaust.

Claim.—The combination of the stove or generator A, the cooler B, the diaphragm treating-vessel C, an exhausting or forcing device, *g*, and the pipes *b'*, *d*, *e*, and *f*, constructed or provided with traps, substantially as and for the purpose herein set forth.

134,656.—*Hemp-Harvester.*—PHILONZO S. FITCH, Hanly, Ky.

Hinged rake-arms, pivoted to a vertical post, are operated in horizontal planes, by means of double cranks, to present the uncut grain to the cutter and deliver in gavels in the rear of the main frame. An arm, operated by a cam, retains the gavel on the outer edge of the platform until the proper moment for delivery.

Claim.—1. The combination of the jointed raking-levers D D', the post or standard C to which they are pivoted, and the cranked shaft E, substantially as and for the purpose herein set forth.

2. The combination, with the end portions of the raking-levers D D', of pivoted flaps or wing pieces K K, essentially as and for the purpose specified.

3. The combination of the oscillating lever H and cam G on the cranked shaft E, substantially as and for the purpose herein described.

134,657.—*Lamp-Burner.*—THOMAS W. GARDNER, Terre Haute, Ind., assignor of one-half his right to HIRAM J. KEELER, same place.

Claim.—In combination with the wick tube A, which is extended below the cap A' to near the bottom of the bowl of the lamp, the dome C, when constructed with the elongated neck C' to form an air-passage around and to the top of the wick-tube, substantially as herein described, and for the purposes set forth.

134,658.—*Clothes-Wringer.*—GEORGE E. GAULT and ALEXANDER W. WINALL, Cincinnati, Ohio, assignors to "THE QUEEN CITY WRINGER COMPANY," same place.

A clothes-wringer with cylindrical boxes resting in cylinders formed in the sides or uprights of the frame, through which is passed a metallic guide to give them an erect position when in use. The two journal-boxes are connected to limit their action and prevent a separation of the gears by metallic hooks. The driving-shaft is constructed with a flattened and inclined surface for the crank, which is firmly held to it by the nut upon the end of the shaft.

Claim.—1. The journal-boxes F having a circular form, in combination with the post A provided with the correspondingly-shaped vertical slots or openings, substantially as and for the purpose specified.

2. In combination with the boxes F and springs K and L, the studs or pins I secured upon and extending upward from said boxes, substantially as and for the purpose shown.

3. In combination with the journal-boxes of a wringer, suitable links for connecting together and limiting the relative motion of the same, substantially as and for the purpose set forth.

4. In combination with the roller-shaft E provided with the flattened inclined portion *e'*, the threaded end *e*, and the nut O, the crank N provided within its hub with the opening *n* and enlargement *n'*, substantially as and for the purpose shown and described.

5. The hereinbefore-described device as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose specified.

134,659.—*Drier.*—WILLIAM ALFRED GIBNS, Gillwell Park, Sewardstone, and ALFRED BORWICK, London, England.

The interior air-duct has longitudinal slits; it may be stationary or revolving. If the latter, it has a motion contrary to that of the cylinder. In the former instance it has counterbalanced scrapers to remove the sticky or viscous matter from the inner side of the cylinder; but when it revolves it has, instead, longitudinal bars, to which scrapers are attached at an angle so as to give propelling motion to the drying substance. Over an inclined double floor, which is heated, the matter to be dried may pass or flow into the case.

Claim.—1. In a drying apparatus, the combination of a revolving drying case or cylinder with an air-duct provided with one or more longitudinal slits, and mounted or arranged in said cylinder or case, the latter being heated both internally and externally, as described, and the combination operating substantially as set forth.

2. The combination, in a drying apparatus, of a revolving drying case or cylinder and a revolving air-duct mounted or arranged in the same, substantially as shown and described, whether said air-duct has one longitudinal slit or several such slits.

3. The combination, with a revolving drying case or cylinder and a longitudinally-slitted air-duct mounted therein, of scrapers located within said case or cylinder, and operating substantially as shown and described.

4. The combination, with a revolving drying case or cylinder and an air-duct provided with one or more longitudinal slits and mounted therein, substantially as specified, of a drying-floor, substantially as described and shown in Fig. 9 of the accompanying drawing.

5. The combination, with a revolving drying case or cylinder and a longitudinally-slitted air-duct mounted therein, of the means herein described, or the substantial equivalent of the same, for supplying the heating agent to said air-duct and for heating said cylinder externally, substantially as shown and set forth.

134,660.—*Track-Clearer.*—ANDREW J. GOVE, San Francisco, Cal.

The combination, with a snow-plow, of a "clam-shell" dredger.

Claim.—The sectional buckets D D attached to the mast *d*, and arranged to be opened and closed by cords or chains A, *f*, and K, in combination with the angular swiveling-crane B, when said crane is attached to and the buckets operated from the deck of a snow-plow, A, substantially as and for the purpose above described.

134,661.—*Cradle.*—MORTIMER GRIFFIN, Brooklyn, N. Y.

The crib or cradle end and rocker constructed with thin pieces sawed to form and glued firmly together, with its outside or face veneered with another material—mahogany or other fancy wood.

Claim.—An end piece for a cradle formed of the face-stripe A, filled-in stripe *a a*, cross-piece C, and rocker B, secured to the bottom parts of the connected stripes A *a a* by the dowels D D, after being pressed inward, all constructed substantially as set forth.

134,662.—*Cultivator.*—WILLIAM G. HALBURT, Columbus, Miss.

An adjustable clevis for attaching the forward end of the plow-beam to the frame, and devices for regulating the distance between the stocks.

Claim.—1. In combination with the frame A B C, the sliding clevis C' moving in the slots *e*, and the curved tongue F, all constructed and arranged substantially as and for the purpose set forth.

2. The wedges *f f*, in combination with the cultivator-stocks G G and screw-bolts *g g*, substantially as and for the purpose set forth.

134,663.—*Attaching Patterns to their Supporting-Plates.*—JOHN H. HARPER, Pittsburg, Pa.

Claim.—1. The detachable patterns B, connected to the plate by the anchor D or its equivalent, substantially as described, for the purposes set forth.

2. The extension rings or segments C, in combination with the patterns and the plate, substantially as described, for the purposes specified.

134,664.—*Hammer-Roll Device for Forming Horseshoe-Nails.*—THOMAS HARRIS and PATRICK DUNN, Coté St. Paul, Canada.

In a horseshoe-nail machine the ordinary roll for reducing the blank is adjusted, in this case, by means of its shank being screw-threaded and provided with a set-nut, and keys which are situated under the stock. By this means the roll can be set to reduce the nail to any thickness desired.

Claim.—1. In combination with the stock *a* and its roll *f*, shank *b*, and nut *c*, the wedge-shaped keys *c c'* for adjusting said roll to the thickness of the nails to be made, substantially as described.

2. The combination of the wedge or key *c*, the pins *n n*, and the shaft or roll pin *i*, as and for the purpose described and represented.

134,665.—*Cultivator.*—JOHN M. HEIGES, York, Pa.

A cultivator having a curved mold-board pivoted to the rear end of either outside beam, and capable of being adjusted to act in connection with either of the cultivator-teeth.

Claim.—The curved mold-boards D, having flanges *d* at the upper rear end, pivoted to the rear ends of beams B B, and so arranged that the points of said mold-boards may be brought against the sides of the central tooth or turned to any desired position, substantially as specified.

134,666.—*Saw-Swaging Device.*—CHARLES F. HENIS, Baltimore, Md.—Case A.

A divided conical swage, the two parts pivoted together, is fitted into a recess in the end of the holder. A bifurcated arm, the eye on which fits loosely the shank, where it is adjusted and kept in line by a pin entering holes in one side, straddles the saw, and a rider, sliding in slots and held by a screw-bolt and nut, rests on one of the saw-teeth while another is being swaged.

Claim.—1. A conical saw-swage, in combination with a swage-holder having a conical recess for its reception, when the said swage is made in two parts which are connected together by a pivot, as specified.

2. The saw-swage made in two parts, connected together, and inserted in the swage-holder, and having a recess flaring symmetrically at each side, substantially as described.

3. A conical saw-swage composed of two longitudinal parts pivoted together and having an end recess formed partly in each to receive the point of a saw-tooth, substantially as described, and for the purpose specified.

4. The combination of the swage-holder A, arm D', and a sliding pin to fasten the arm upon the holder, substantially as explained.

5. The combination of the arm D', rider F, nut *m*, nut-lock *o r*, and a spring, all arranged as described.

6. The combination of the swage-holder A and bifurcated arm D', as specified.

7. A saw-swage held upon the teeth in the plane of the saw by means of the recess in the swage-holder, the adjustable bifurcated arm, and the adjustable rider, substantially as described, and for the purpose specified.

134,667.—*Saw-Swaging Machine.*—CHARLES F. HENIS, Baltimore, Md.—Case B.

A frame and handle, slotted to admit the saw-blade, has a swage arranged within a frame, which has a slight movement allowed it by a pin passing through the swage into slots in the frame, to which a spring is attached. A spring-hammer, operated by a crank and cams, strikes on the swage and upsets the tooth.

Claim.—1. A frame constructed to bestride a saw, and combined with a sliding swage-holder, striking-hammer, and mechanism for operating the hammer, substantially as described.

2. The combination of the frame A, sliding swage-holder C', and spring I, all arranged as specified.

3. The combination of the frame A, sliding swage-holder C', vibrating hammer D, rotating cam-head E, and springs A *i*, all arranged as set forth.

4. The combination of the frame A, socket I, and adjustable rider H *k*, all arranged as explained.

5. A spring swage for saw-teeth arranged within a suitable frame to receive the blows of a hammer so that the spring shall resist the force of the blows, and at the same time take up the recoil of the swage, for the purpose of holding the latter upon the teeth, substantially as described, for the purpose specified.

6. A spring-swage for saw-teeth arranged within a frame which bestrides the saw, and operated by a vibrating hammer carried within the frame, substantially as described, for the purpose specified.

7. In combination with the vibrating hammer and the spring-swage, the device for operating the hammer, substantially as described, for the purpose specified.

134,668.—*Baby's Chair.*—PETER HENRICHS, Erie, Pa.

The seat-board and cushion are independent of each other and both detachable, sliding out. The legs of the chair rest on two cross-bars, and to these cross-bars are hinged rockers having casters secured to their inner face. An adjustable and detachable table slides on the arms of the chair and is automatically locked at any desired point by a spring-bolt. Posts are seated on this sliding table, to which is secured a spring-rod bearing small bells.

Claim.—1. In a child's combined rocking and walking chair, the detachable seat-board E and cushion F, so arranged that when it is to be used as a walking-chair the entire interior frame-work is left open or unobstructed, said chair being seated on horizontal cross-bars B' B' at front and rear, and to which are pivoted or hinged rockers D D having casters D' D' on their inner faces, the whole being so constructed, combined, and arranged as to operate substantially as described.

2. In a child's chair, the ribs or cleats *s s* on the outer face of the side arms A' A', and a spring bolt or latch, G', arranged in the front cross-bar C, which connects said arms, in combination with a sliding table, G, having a series of openings or apertures, *g g*, on its under face, the whole being so constructed and arranged as to provide an adjustable table which is automatically secured, substantially as described.

3. In combination with the detachable table G, the posts H H, spring-rod A, and bells H' H', the whole being so constructed and arranged as to operate substantially as described.

134,669.—*Thread-Cutter for Sewing-Machines.*—CHARLES J. HENRY, Tankhannock, Pa., and CORNELL J. WOOD, Brewerton, N. Y.

The forward end of the presser-foot, under the guard, is provided with a cutting-edge, and the thread is cut when drawn between such guard and presser.

Claim.—The presser-foot F having the cutting-edge H, constructed as described, and combined with the guard G, in the manner and for the purpose set forth.

134,670.—*Plow.*—RICHARD G. HOBSON, Houlka, Miss.

The beams of the cultivator are parallel to each other, and are adjusted by means of bolts and nuts. The shorter beam is secured against backward strain by means of a spring-brace, attached by a hinge-joint to its forward end, and by a bolt to the main beam.

Claim.—The beams A B, when connected by the hinged and slotted spring-brace C, in combination with the screw-bolts E E, all constructed, arranged, and operated as set forth.

134,671.—*Separator for Thrashing-Machines.*—GEORGE W. HOWE, Vineland, N. J.

Straw-carriers and platforms so arranged as to deliver the grain separated from the straw in the thrashing-cylinder and on the riddles to one common point.

Claim.—The combination of the carrier C with the carrier D placed beneath it, the platform G also placed beneath the carrier C and beyond the carrier D, and the platform E placed within the carrier E, all arranged as described.

134,672.—*Brick-Machine.*—EDWARD R. HUBBARD, New York, N. Y., assignor to himself and GEORGE FARR, same place.

A pug-mill on each side of a rotary cylinder, carrying a mold-rim, forces the clay through the vertical openings in the rim, while two plungers, worked from opposite sides by cams on the cylinder, compress the clay; and as one plunger recedes the other advances, thus expelling the brick through the horizontal openings of the rim onto a carrying-off belt.

Claim.—1. In combination with an annular mold-rim, E, provided with the vertical and horizontal apertures *f e*, the pug-mills G and double series of plungers working in the molds from opposite sides, substantially as described.

2. The combination and arrangement of the pug-mills G with the mold-rim E *e f* on the rotary cylinder A, and with the double series of plungers operated from opposite sides of the molds by means of the stationary cams D D′, substantially as described.

3. The combination, with the rotary cylinder A carrying the mold-rim E *e f*, of the rim *g* and the endless carrier, all arranged and operating substantially as described.

4. The connection of the plunger-stems with their slides by means of ball-and-socket joints, substantially as described.

134,673.—*Spring for Vehicles.*—FRITZ K. JOHN, Moscow, Russia.

Claim.—A spring for vehicles composed of two or more annular disk-shaped plates with radially-arranged corrugations *b b* between outside and inside flanges or margins *c d*, and bent to assume a conical shape, and alternately connected around their inner and outer peripheries, substantially as shown and described.

134,674.—*Honey-Box for Bee-Hives.*—HARLEY M. JOHNSON, Marshall, and CASSIUS M. BARKER, Albion, Mich.

The superincumbent honey-boxes are each made of transverse boards secured at bottom to side and end strips, said boards alternately of unequal width, so as to make spaces equal to the excess of a broad board alternating with a narrow one, the ends of the box being of glass, the top and two sides having thin paper pasted thereon, the interior containing perforated division-pieces fitting in the several crevices. The paper is cut when the boxes are divided.

Claim.—1. A honey-box made of alternate broad and narrow strips of wood or other material and glass or other ends in such manner that when two or more boxes are arranged together, the narrow strips of one box being adjacent to the broad strips of the next, a space will be formed between said boxes on all sides, constituting entrances thereto.

2. A honey-box constructed of two or more small boxes, as described, secured together by strips of suitable material attached thereto, the box thus formed having three sides covered with paper and the ends with glass and provided with perforated division-boards, all substantially in the manner, and for the purpose specified.

134,675.—*Apparatus for Making Tannin Extracts, &c.*—THOMAS W. JOHNSON and ANTHONY W. GOODELL, New York, N. Y.

The material is supported in layers upon perforated platforms, and steam is admitted below the platforms while liquids are showered upon the layer on the upper platform.

Claim.—1. An apparatus for extracting tannin and other substances, composed of a series of perforated platforms that divide the mass up into layers, and steam-pipes supplying steam below the respective platforms, and a filter for detaining foreign particles, substantially as set forth.

2. The arrangement of two or more concentrating-vessels with revolving disks and steam-heating pipes, as shown, in combination with the extracting apparatus, as specified.

3. The concentrating apparatus, composed of a vessel with steam-pipes at the bottom, in combination with the revolving disks and longitudinal connecting-bars that act as stirrers, as set forth.

134,676.—*Car-Coupling.*—CHARLES H. KENDALL, McConnellsburg, Pa.

A pin hanging in a groove in the platform of a car, with an inclined guard placed over such groove to prevent the pin from turning and thereby bringing its head lengthwise of the groove and falling through the same. The guard allows the pin to swing backward when struck by the link, and forward when the link has passed beyond its point.

Claim.—The platform A provided with a transverse slot, *a*, front plate C having a slot, *c*, and bottom plate D, in combination with the inclined guard F having a notch, *o*, and coupling-pin B, all constructed, arranged, and operated as set forth.

134,677.—*Derrick and Crane.*—JOSIAH W. KENNEDY, St. Louis, Mo.

Claim.—The improved portable hoisting-machine herein described, consisting of the movable carriage A, the rotary frame B working within the flange B′, the upright frame C, and the tackle, fall, and windlass, all combined substantially in the manner and for the purposes set forth.

134,678.—*Corn-Harvester.*—WILLIAM H. KENYON, North Providence, R. I.

An endless-apron rake or conveyer receives the cut corn from a cradle-like cutter, which shears against a stationary cutter located to one side and to the rear of the main frame, and delivers behind and between the tracks of the supporting-wheels out of the way for the next round.

Claim.—1. The combination of the movable knife I, wire frame J, and catch *p*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The combination of the stationary knife H, movable knife I, pitman *w*, weighted fly-wheel L, shaft *t*, and gears *v* and D *a*, all substantially as and for the purposes herein set forth.

3. The lever K, operated by the standing corn and connected with the shaft *t*, for throwing the pinion *v* in gear with the cog-wheel D *a*, as herein set forth.

4. The pin or arm *i* on the pinion *v*, operating, in connection with the shoulder *d* on the wheel D, for throwing said pinion out of gear with the cogs *a* on the wheel, as herein set forth.

5. The arrangement of the frame and platform A′ with pulleys *k k*, wheels *h h*, endless chains E E with arms *i i*, guards *m m* and *r r*, and shelf G, all substantially as and for the purposes herein set forth.

6. The combination, with the shaft *f* and pinion *e*, of the slide *y*, spring *z*, lever *a′*, and one or more pins, *b′*, on the pinion *d′*, said pinion being operated by the worm *c′* on the axle, for the purposes herein set forth.

134,679.—*Guitar.*—RUDOLPH KNAFFL, Nashville, Tenn.

A pedal attachment whereby a movable *capo d'astro* or bridge is adjusted at once to any point upon the fret-board.

Claim.—1. In the described combination with the yielding pressure-roller D, the treadle P and spring V, for advancing and retracting the said roller upon the fret-board.

2. In the described combination with the elements D P V, the spring H, as and for the object designated.

3. In combination with the elements D P V, the friction-roller W in groove or track X.

4. In combination with the elements D P V, the staff Q *q*, having the described flexible connection with the guitar-body, and being provided with a treadle-guide, R *r r′*.

5. In the described combination with the elements of the preceding clause, the cords L and M and the differential pulley N O.

6. The described arrangement of continuous sounding-board A′, blocks 1 2, props 3 4, plates 5, distending-screws 6, and nuts 7, for the purpose of stiffening or relaxing such sounding-board, in the manner explained.

134,680.—*Nail-Clincher.*—JOHN KUNZ, Napoleon, Ohio.

The jaw B is placed under the shoe and the jaw B′ brought to bear against the projecting nail, which it clinches by a firm and gradual pressure. The jaw B′ tapers toward its end, and is elastic so as not to bruise or injure the hoof.

Claim.—The clincher for horseshoe-nails, consisting of the pivoted levers A A′ having, respectively, the straight serrated jaw B and the oblique, elliptical, elastic jaw B′ with serrations *b′*, substantially as specified.

134,681.—*Bracelet-Fastening.*—FRANK KURSH, Philadelphia, Pa.

An oval button rotates over a longitudinal slot, which allows its depression on the spring-fastening in one position only.

Claim.—1. The button of the catch, constructed to rotate and rest on the surface of the bracelet to lock the catch, substantially as set forth.

2. The rotating button C with neck K, in connection with the fastening or catch B of a bracelet, and operating relatively to the ends of the two parts thereof, substantially as set forth.

3. The rotating button C with neck K, lug G, and slots H, in combination with the two parts of a bracelet and its catch B, substantially as and for the purpose set forth.

134,682.—*Manufacture of Loaf-Sugar.*—EUGEN LANGEN, Cologne, Prussia.

The sirup is evaporated to the proper consistency, placed in molds of centrifugal machine, and drained, after which it is transferred to the vacuum-tank and treated with the claying liquid. A thickness of India rubber forms a packing for the joint between the bottom and adjacent portions of the mold.

Claim.—1. The process herein described of purifying loaf-sugar by subjecting it alternately to the action of a centrifugal machine and to that of the claying liquor in a vacuum-tank, substantially as herein set forth.

2. The combination, with the molds and their bottoms *a*, of the layer or packing *c* of India rubber or its equivalent, whereby a tight joint is formed to the mold, and the latter fitted for use in the vacuum-tank, substantially as herein set forth.

134,683.—*Reservoir Cooking-Stove.*—HENRY LAPTIN, Troy, assignor of one-half of his right to PELETIAH Z. MARSH, Lansingburg, N. Y.

The rear vertical flue passes centrally between two water-reservoirs, or between a warming-closet and a reservoir having a supplementary closet under it.

Claim.—1. The flue *g*, in combination with the ascending rear flue of the stove *d*, substantially as and for the purpose described and set forth.

2. The combination of reservoir *i*, flue *g*, and closet or warming-oven *h*, when arranged substantially as described and set forth.

3. The combination of reservoir *i*, flue *g*, closet *h*, and extra or lower closet *l*, when arranged substantially as described and set forth.

4. The combination of flue *g* with a reservoir placed each side thereof, when arranged substantially as described and set forth.

5. The pit or flue *k*, in combination with closet *h*, reservoir *i*, and flue *g*, when arranged substantially as and for the purpose described and set forth.

134,684.—*Bridle-Bit.*—JOSIAH LETCHWORTH, Buffalo, N. Y.

The wire bit is covered at each side with soft rubber.

Claim.—As a new article of manufacture, a bridle-bit having a jointed mouth-piece of twisted wire provided with the two sleeves C C of soft rubber, as herein shown and described.

134,685.—*Manufacture of Steel.*—HILAIRE ANDRÉ LEVALLOIS, Paris, France.

Soft iron, tungsten, and nickel.

Claim.—A compound for steel, made of the ingredients herein specified, and mixed together substantially in the manner and about in the proportion set forth.

134,686.—*Apparatus and Process for Revivifying Bone-Black.*—AUGUST LONSKY, Hoboken, N. J.

The bone-black, after its removal from the filters, is placed in a tub upon a perforated false bottom, which is protected by wire-cloth, and after having been treated with chemicals is exposed to the action of steam.

Claim.—1. The within-described process of treating bone-black, after removal from the filter, by first exposing the same to the action of chemicals, such, for instance, as alkalies, and then to the action of steam, while the bone-black is inclosed in a suitable tub or reservoir, substantially as set forth.

2. The within-described apparatus for revivifying bone-black, consisting of a tub, A, provided with a closely-fitting cover, E, a perforated false bottom, B, covered with wire-cloth D, and furnished with a steam-coil, C, with a liquid-discharge pipe, *c*, and with a faucet, *a*, the whole constructed and operating substantially as set forth.

134,687.—*Bee-Hive.*—DAVID LOOYBOURROW, Hillsborough, Iowa.

Two frame-chambers surmounted by their honey-boxes, one frame and box fixed, the other detachable for substitution; windows and guards to each, and lower ports and slides, and passages through the top to the honey-box, the chambers having communicating ports with cut-offs.

Claim.—The hive, consisting of the fixed chamber C and the detachable chamber B, with a communicating aperture and its sliding valve, window, and guard, in combination with the honey-cap E and openings *i i*, all as shown and described.

The body of the chair is made to rock on a platform, and is secured thereto by spiral springs and flat springs.

134,688.—*Rocking-Chair.*—GEORGE E. LORD, Utica, N. Y.

Claim.—The rocker formed by and rocking directly on the seat-rail of the chair, in combination with the stool A with the platform B, the rocker-rail C, the spiral-coil spring E, the sheet-metal spring F, together forming a rocking-chair, substantially as and for the purpose set forth.

134,689.—*Steam Pumping-Engine.*—ARTHUR J. L. LORETZ, Brooklyn, N. Y.

A series of telescopic pipes, enlarged at the ends where they are united, form a valve-chamber containing a triple-beat valve, and are operated by a series of segments, connecting-rods, and a crank on the fly-wheel shaft of the engine. The tubular end of the pipes slides through a stuffing-box and gland; uses the water that is pumped as a means to condense the exhaust-steam by which the vacuum is created.

Claim.—1. The movable telescopic tubes T, united and enlarged at their centers C sufficiently to contain a valve, V, having a water-passage equal in area to that of the tubular piston, when all constructed substantially as shown, and for the purpose herein described.

2. The vacuum-chamber V with its internal pipe U and its annular space Q arranged substantially as and for the purpose herein described.

3. The combination of the segments S^1 S^2 S^3 S^4, and the connecting-rods C C, crank K, links M^1 M^3, and cylinders A B, substantially as and for the purpose herein described.

4. The telescopic tubes T provided with valves V, the vacuum-chamber V′, its annular space Q, and jet J, in combination with the segments S^1 S^2 S^3 S^4, connecting-rods C C, crank K, links M^1 M^3, and cylinders A B, all substantially as and for the purpose set forth.

134,690.—*Manufacture of Isinglass.*—JAMES MANNING, Rockport, assignor to C. J. NORWOOD, Ipswich, and J. J. MANNING and W. N. MANNING, Rockport, Mass.

The sheet may be returned to the hopper to be again compressed by the rolls, or it may be removed to a set of machines to be gradually reduced to the desired thinness.

Claim.—The herein-described method of converting isinglass into sheets of any desired thickness by running it between hollow rolls into which cold water is thrown to cool the compressing surfaces, such rolls being preferably made adjustable to graduate the degree of compression, and the adhering sheets being removed from the rolls by stationary scrapers or clearers and returned to the hopper, as required.

134,691.—*Combined Chair, Table, and Bureau.*—HAMILTON MARTINDALE, Newark, Ind., assignor of one-half his right to JAMES R. CROW, same place.

The seat-frame of the chair is open, and is provided with a movable bottom that slides under the table when the two articles are folded together. The bureau is also hinged to the table, and folds into the open seat-frame of the chair.

Claim.—The improved article of furniture, consisting of the open chair-frame A′ having the movable seat H, and the table A having the bureau C, both chair and table being hinged together, substantially as specified.

134,692.—*Carriage-Seat.*—CHRISTIAN K. MELLINGER, Lebanon, assignor to himself and JACOB REINOEHL, Jr., Harrisburg, Pa.

Claim.—1. In a "jump-seat" vehicle, the front board E and back board E′ having the slots F F′, and supported by the posts G G^1 and braces G^2, substantially as specified.

2. The blocks H in combination with the slotted back E′, substantially as specified.

134,693.—*Coloring Pictures.*—CHARLES JOSEPH METTAIS, New York, N. Y., assignor to GUERNSEY SACKETT, same place.

The use of mutton tallow or fatty matter with pastel or dry colors stumped over a photograph, &c.

Claim.—1. The process, substantially as described, of coloring and finishing portraits or pictures by combining and applying, with crayon, pastel, charcoal, or similar dry colors, a solid fatty matter of the character described, as and for the purposes specified.

2. As a new production in the art, and constituting a new article of manufacture, a picture or portrait executed in whole or in part with crayon, pastel, charcoal, or dry colors, applied thereto in combination with a solid fatty matter, of the character substantially as herein described.

134,694.—*Indigo-Blue Vat for Coloring Wool and Cotton.*—GUSTAV MOLT, Millbury, Mass.

Combines pulverized indigo with the third mixture, and heats to 160° Fahrenheit.

Claim.—The compound composed of lime and soda-ash, and called composition No. 1; and the compound composed of muriate-of-tin crystals and soda-ash, called composition No. 2; and the composition composed of compositions Nos. 1 and 2, and called composition No. 3, in the foregoing specification, substantially in the proportions and for the purpose herein set forth.

134,695.—*Car-Coupling.*—BAYARD MOORE, Seaford, Del.

The draw-bar is divided into three sections, the top portion consisting of a barbed spear, which is turned by a lever and projected by suitable devices, in combination with a sliding bar which projects forward from the lower portion of the draw-bar.

Claim.—1. The combination of a coupling-box, B B′, and rotatory spear-headed coupling-bar C C^1, arranged side by side and connected together, but operating independently, substantially as specified.

2. The combination, as set forth in the first claim, of the coupling-box B B′ and rotatory spear-headed coupling-bar C C^1, the latter being capable of being projected and retracted, substantially as and for the purpose specified.

3. The combination of a coupling-box, B B′ b^3 b^3, spear-headed rotatory coupling-bar C C^1, and feather *c*, and sectoral groove *c′* to limit the rotatory motion of the coupling-bar, substantially as specified.

4. The coupling-bar C, in combination with the swiveling-guide E and yielding bearing F, substantially as and for the purpose specified.

5. The combination of the coupling-bar C, slide-bar H, and intermediate devices for imparting the motion of one to the other, substantially as specified.

6. The combination of the collared coupling-bar C, tappet G, shaft G^1, arm G^2, weighted arm G^3, and slide-bar H, substantially as set forth.

7. A coupling-box and a coupling-bar connected together, but operating independently, as described, in combination with a draw-head upon which they are laterally adjustable, in the manner and for the purposes specified.

134,696.—*Lubricating Car-Axle.*—JOSEPH R. MORRIS, Houston, Tex.

A scoop is attached to the end of the journal, and at every revolution carries oil to the top of the box, where the oil falls upon a shelf, and from thence is conveyed upon top of the journal-bearing. The latter is provided with apertures, allowing the oil to drip through upon the journal.

Claim.—A scoop, E, rotating in oil box C, an axle-box having shelf *b* with holes *b′* and a journal-box, D, recessed on top, and provided with holes d^1 and channels d^2, all combined and relatively arranged as and for the purpose specified.

134,697.—*Hinge.*—FERDINAND MÜCKER, Cincinnati, Ohio.

To the lower arm of the hinge a weighted lever is attached by means of a depending lug. The outer arm of this lever carries a fork which embraces the hub of the lower leaf of the hinge, being guided by grooves. The ends of the fork project upward into recesses cut in the eye of the upper leaf, and thus serve to hold the hinge at any desired position.

Claim.—The arm A provided with the vertically-sliding latching-fork C and the lever D pivoted to the stud *d* which is projected from the edge of said arm A, combined with the arm B provided with recesses *a* to receive the ends of said fork, all constructed, arranged, and operating as set forth.

134,698.—*Guide for Elevators.*—CHARLES R. OTIS, Yonkers, N. Y.

Claim.—The combination, with the car and guides of an elevator, of guide-surfaces of leather or other soft or elastic material, and guide-rollers or slides operating in connection therewith, substantially as herein set forth, for the purpose specified.

134,699.—*Steam Hoisting Apparatus.*—CHARLES R. OTIS and NORTON P. OTIS, Yonkers, N. Y.

The hoisting-drum and friction-brake are combined with a brake-operating steam-cylinder, and a governor, set in motion by the drum, controls the admission of steam to said cylinder. Also combines therewith, and the engine that drives the hoisting-drum, a steam-pipe with a two-way cock controlled by the governor, so that it admits the steam to the valve-box of the engine and the brake-cylinder to throw the brake out of action, and allows free rotation of the drum.

Claim.—1. The combination of a hoisting-drum, a friction-brake, a brake-operating steam-cylinder, and a governor set in motion by the drum, whereby the admission of steam to the brake-operating cylinder is automatically controlled by such governor.

2. The combination of the brake-operating steam-cylinder, the engine, and the pipe *b*, substantially as herein described, whereby the admission of steam to the valve-box of the engine also admits steam to the brake-operating cylinder to throw the brake out of action.

3. The combination of the hoisting-drum B, the brake D with its weighted lever E, the engine A, the governor I, the valve H, the passages *c*, *d*, *e*, and *f*, the piston F, the cylinder G, the pipe *b*, and valve-chest C, essentially as and for the purpose herein set forth.

134,700.—*Chimney-Top.*—HENLEY PALMER, Barnesville, Ohio.

Claim.—1. The hinged conical cap D having the perforations *F* and guards *e*, in combination with the enlarged chimney-rim B and chimney A, substantially as specified.

2. The combination and arrangement of the chimney A, the enlarged chimney-rim B, and hinged conical cap D, substantially as described.

134,701.—*Car-Frame.*—RICHARD M. C. PARKER, Memphis, Tenn.

Rods, having their inner ends secured by connecting-links, pass from the draw-head over the bolster and under the center bolsters. The outer ends of the rods are secured to a plate extending across the end of the draw-bar, strengthening the same and also the center of the car-frame.

Claim.—The pulling and truss rods *c* and their end plates *b*, with or without the adjusting-links *f*, applied to a car-frame, substantially as herein described, to support the draw-head timbers and the center of the car, as set forth.

134,702.—*Covering for Roofs.*—RICHARD U. PIPER, Girard, Mich., assignor of one-half his right to MONROE HEATH, Chicago, Ill.

Claim.—The method of securing sheets of board, paper board, canvas, or other fibrous material upon roofs, by means of thin metallic or equivalent strips applied and arranged substantially as and for the purpose herein shown and set forth.

134,703.—*Carriage-Spring.*—JOHN W. POST, Lansing, Mich.

Stirrups having double bearings are placed over each end of the bolster and secured by staples. Two half-elliptic springs are attached to the stirrups, that the weight of the wagon will be borne more evenly.

Claim.—The stirrups G G in combination with the springs A A, the bolster B and the staples N N, substantially as and for the purpose set forth.

134,704.—*Saw-Guide.*—PAUL PETISH, New York, N. Y.

The bearing-plate has a horizontal adjustment, so that as it becomes worn in one place it may be moved so as to present a new surface to the rear edge of the saw.

Claim.—1. The combination of the reversible jaws B B, guide-piece A, retaining-screw *c*, set-screw *d*, and reacting spring or springs *e*, substantially as herein shown, for the purpose specified.

2. The abutment C made detached from the guide-piece A and secured in position by a spring-catch or other suitable fastening, in combination with said guide-piece and with the jaws B B, the whole constructed and operating substantially in the manner and for the purpose set forth.

3. The slide D, in combination with the guide-piece A and jaws B B, substantially as and for the purpose described.

134,705.—*Hand Printing-Press.*—NELSON ROSS, Washington, D. C.

The frame is provided with bearing-surfaces upon which the hand-impression device, provided with two rollers, is supported while giving the impression, and with a pivoted side-frame (operated by lever and connecting-bars) over which the inking-rollers are passed to ink the form.

Claim.—1. In a hand printing-press galley or type-bed, the combination, with the fixed bearers A thereof for the impression-rollers, of movable or hinged bearers D for the inking-roller, to render the type-frame complete for either inking the type or making the impression.

2. The combination of the hand-lever G and its connecting-rod E *b* with the movable bearers D, arranged as described, to effect the simultaneous movement of the latter, as described.

3. In a hand printing-press, the hand-impression device having two sets of elastic rollers, H, and a handle, J, to operate in printing and obtain the advantages herein described.

4. The hand printing-press and hand-impression roller device, constructed and arranged for joint operation as herein described.

134,706.—*Apparatus for Mixing Soap and other Materials.*—CARL J. SCHULTZE, Vienna, Austria.

Claim.—1. The combination of the outer cylinder or vessel B, the inner cylinder A open at its ends to the interior of the outer cylinder, both above and below, with the corrugated stationary disk F and the revolving disk G, substantially as shown and described.

2. The combination of the revolving shaft D, the screw C, the vanes E, and the corrugated disk G with the cylinders or vessels A B and stationary corrugated disk F, the whole being constructed and arranged in relation with each other, essentially as shown and described.

134,707.—*Device for Holding Hogs in Veterinary Operations.*—ALEXANDER M. SCOTT and THOMAS WILSON, Clearmont, Mo.

The pivoted portion of the stock, consisting of one side, a bottom, and a neck-securing end piece, may be turned down, carrying the animal with it. In this prostrate and secure position any veterinary operation may be performed easily and safely.

Claim.—The spaying attachment H I J to a hog-stock, substantially as set forth.

134,708.—*Attaching Knobs to Spindles.*—SAMUEL SELDEN, Erie, Pa.

The knob is constructed with a removable front, and is secured to the spindle by means of two screw-nuts, one of which is screwed to place before the knob is applied, and the other afterward, in such manner that they shall clasp the web in the shank of the knot between them.

Claim.—In combination with the threaded spindle A A', the knob C D having the removable front and being secured to the spindle by the nuts B B', one on each side of the web *c*, substantially as described.

134,709.—*Lifting-Jack.*—JAMES W. SHANKLAND, Summerfield, Ohio.

Claim.—The combination of the standards A A with inclined grooves *a a*, notches *c c*, and vertical grooves *b*, the lever D with journal *d*, and the pivoted pawl E, all substantially as set forth.

134,710.—*Draft-Pipe for Aerated Liquids.*—OBEAR F. STEDMAN, Westfield, N. Y.

On the exterior of the pipe, near its end, is arranged a sleeve, to which is secured, by means of arms, a convex disk designed to approach the orifice of the draft-pipe closely enough to cause the liquid to be injected with force into the receiving-vessel.

Claim.—In apparatus for dispensing aerated liquids, the long tapering draft-pipe provided with the adjustable convex disk D covering the discharge-orifice, and adapted to be inserted in the bottom of a receiving-vessel, substantially as specified.

134,711.—*Extension-Table Slides.*—GEORGE W. TOWNSEND, Hubbardston, Mich., assignor to himself, Oliver C. Townsend, and Henry W. Hitchcock, same place.

In a series of slide-bars each bar is provided on one face with two or more tongues, and on the opposite face with corresponding grooves. Between each pair of grooves is another shallow groove, which has through its central portion a slot which extends through the bar. The bars are connected together by bolts that pass through the slots, the heads of the bolts sliding in the central groove that extends on the sides of the slots.

Claim.—The slide-bars A provided with the grooves B' and C, the tongues B, and the slots D, and combined by means of the bolts E, substantially as and for the purpose specified.

134,712.—*Restoring Ring-Traveler Spinning-Rings.*—FRANK TULLY, Philadelphia, Pa., assignor to himself and CHARLES H. BANES, same place.

Forming a flange on the unflanged end of a worn ring for ring-traveler spinning-machine.

Claim.—The utilizing of the within-described waste-rings by flanging their bases, as herein set forth.

134,713.—*Compound for Use in Tobacco-Pipes.*—WILL. E. TURNER, Neosho Falls, Kans.

The smoke is drawn through a compound consisting of citric, tartaric, or tannic acid, Florida or clove water, and glycerine, contained in a chamber of the pipe made for holding the sponge.

Claim.—The above chemical ingredients or compound, as and for the purpose hereinbefore set forth.

134,714.—*Process of Bleaching, &c., Dried Natural Flowers.*—JOHN W. WARE and MARIA L. WARE, Philadelphia, Pa.

The leaves are immersed in a solution of chloride of lime, salsoda, and water, and bleached, after which they are washed in water and then dried.

Claim.—The process herein described for bleaching natural flowers for preservation.

134,715.—*Sash-Holder.*—EDWIN W. WARREN, Cambridge, N. Y. Case B.

A bed-plate, having a half-round, half-angular hub or projection, is secured to the window-sash. Pivoted on this hub, through a corresponding slot, is an ordinary eccentric cam having rubber cushions and provided with a hook or catch for locking purposes. Within a recess on the inner side of this cam a flat spring traverses the slot in such manner that when pressed upon by the convex side of the hub the rubber cushions of the cam are forced against the window-frame, while when acted upon from the opposite direction the spring causes the hook or catch to enter recesses in the frame and lock the window in position.

Claim.—The latch C having the hook *a*, cam a^1, and partially concave or arched slot a^2, in combination with the half-round and half-angular hub or projection B and spring *e*, substantially as specified.

134,716.—*Plow.*—WILLIAM M. WATSON, Tonica, Ill.

Claim.—1. A plow having the standard B and braces E, constructed, arranged, and adapted to receive, interchangeably, the the wheel F and land-side H, substantially as specified.

2. The shield G, in combination with the plow, as described, and for the purpose specified.

134,717.—*Machine for Cutting Up Fat Meats for Lard-Rendering.*—JOHN WEBER and WILLIAM C. SIEFERT, Lancaster, Pa.

A set of vertical knives and set of horizontal knives are operated by a double crank. The knives work through a slotted bed-plate and in vertical guides. An endless apron conveys the meat to the cutters. Rollers press it.

Claim.—1. The arrangement of a double crank, W, when applied for operating combined vertical cutters P *p p* and horizontal cutters *k k*, substantially in the manner and for the purpose specified.

2. The combined vertical cutters P *p p*, in combination with the vertical guides *t*, slotted bed-plate *v*, and edged cross-blade *w*, jointly operating in the manner and for the purpose mentioned.

3. The horizontal knives or cutters *k k*, in combination with the sliding foot-block *g* in guides *m*, and keeper A with the upright slotted post F, operated substantially in the manner and for the purpose described.

4. The pressing and holding device, consisting of the rollers *f f*, bearings *d*, lid or top L, posts M, and cross-piece N, in combination with the spiral springs *s* and guide-rods O on the top of the trough J with its endless apron *r*, all arranged substantially in the manner and for the purpose specified.

134,718.—*Lamp-Burner.*—MARION J. WELLMAN, New York, N. Y.

Claim.—1. The arrangement of finger-pieces E on the cone, overlapping the cup of the burner, substantially as described.

2. The vertical border D of the cone C, provided with the hooks I for passing under the stud H on the cup of the burner, as herein shown, for the purpose specified.

134,719.—*Steam Bell-Ringer.*—JOEL WEST and OSREN M. PARKER, Quincy, Ill.; said PARKER assignor to said WEST.

The peculiar and cylindrical construction of the valve having two arms or stems, one passing out each end of the valve-chest; also, the piston-rod passing through each end of cylinder; said rod, having tappets on each end, strikes the extended end of the valve-stem, thereby communicating a reciprocating movement to the valve; and the whole operated by the vibrating movement of the bell.

Claim.—1. The valve-stem M, when extended through both ends of the steam-chest B, and arranged to operate with the other parts of a steam bell-ringing device, substantially as described, and for the purpose set forth.

2. The tubular valve E, when constructed as described, and arranged to operate with the ports G G', substantially as described, and for the purpose specified.

3. The combination of the cylinder A, steam-chest B, and piston I, the latter being of less length than the distance between the ports H H', and arranged in relation to the same, substantially as and for the purpose specified.

134,720.—*Steam-Boiler.*—FREDERICK A. WOODSON, Selma, Ala.

Connected to the boiler by suitable pipes are two mud-drums placed transversely beneath said boiler, one at the rear and the other in front within the fire-box and over the fire, whereby a uniform temperature and free circulation of the water and the separation of all the mud and sediment contained therein from the same is secured.

Claim.—In combination with one, two, or more boilers, A, and with a fire-box or combustion-chamber, G, the mud-drums C E, arranged as shown, viz., the drum C at the rear of the boiler, and the drum E at the front thereof and in the combustion chamber, and connected to the boilers by the water-legs B F, and to each other by the circulating-pipes D D outside of the brick-work, as and for the purpose described and represented.

REISSUE PATENTS.

5,216.—*Corset-Spring.*—FRANCES LEE EGBERT, New York, N. Y., executrix of SAMUEL H. BARNES, deceased.—Patent No. 56,345, dated July 17, 1866; reissue No. 2,929, dated May 12, 1868; reissue No. 3,520, dated June 29, 1869; reissue No. 3,624, dated August 31, 1869; reissue No. 5,130, dated November 5, 1872.

Claim.—1. A pair of corset-springs, each spring consisting of two or more metallic plates placed one on another, and so connected as to prevent them from sliding off each other laterally, and to admit of their playing or sliding on each other in the direction of their length.

2. A pair of corset-springs, each member of the pair being composed of two or more metallic plates placed one on another and fastened together at their centers, and so connected at or near each end that they can move or play on each other in the direction of their length.

3. A pair of corset-springs, each spring consisting of two or more metallic plates placed one on another, and so connected as to prevent them from sliding off each other laterally, and to admit of their playing or sliding on each other in the direction of their length, the pair being provided with a clasp or clasps, by which the two members of the pair can be connected and disconnected.

5,217.—*Thrashing-Machine.*—DAVID C. BAUGHMAN, Tiffin, Ohio. Patent No. 115,680, dated June 6, 1871.

Straw-carrier of reciprocating toothed rake-bars, two bars attached to a common head, which works on a crank-shaft or which may be fastened to a straight shaft by an eccentric. Between bars are perforated slats allowing grain to fall onto a movable bottom, which directs it into the sieves. Moving parts receive motion from a common gear-wheel through a rock-shaft and connecting-pitman.

Claim.—1. The rock-shafts *n n*, in combination with the toothed bars E E, substantially in the manner and for the purposes herein set forth.

2. The movable bottom H, shafts *n n*, and vibrating arm S, constructed and arranged substantially as and for the purposes herein set forth.

3. The vibrating arm S, with its connections R, *x*, and *o'*, arranged to operate substantially as and for the purposes herein set forth.

4. The bailing-board M, provided with teeth on its upper side, and arranged in relation to the elevator N, substantially as herein set forth.

5. The arrangement of the belt *f'* connecting the fan-shaft with the conveyer, the pinion *h'* on the conveyer-shaft, cog-wheel *h'*, shaft *m*, and pulleys *n' n'*, said pulleys to be connected with the stacker, all substantially as described.

6. In combination with a shaft having a series of cranks or eccentrics set at opposite or varying angles, a series of dividing blocks, a^3, each of which is placed upon and operated by one of such cranks or eccentrics, and has two or more toothed bars, E, attached to it, substantially as and for the purposes herein set forth.

5,218.—*Clothes-Wringer.*—JACOB BRINKERHOFF, Auburn, N. Y.—Patent No. 122,220, dated December 26, 1871.

The rolls are driven by gearing through the medium of a countershaft which extends across the wringer.

Claim.—1. The combination of two rolls and suitable connecting mechanism with a countershaft having a fixed journal at one side of the frame and a sliding journal at the other.

2. The combination of the rolls C and D, arranged, with gearing and sliding boxes and journals, to allow one or both ends of the rolls to be separated without changing the relative position of the gearing.

3. The combination of the train of gears *d e f* with the box B, so that they shall always move together, and consequently be always in gear with each other while they move up and down with the upper or yielding one of the pair of rolls, substantially as described.

4. In combination with the train of gears and the under roll detached from the box B, the countershaft E and gears *h j* for driving said under roll, substantially as described.

5. The upper roll C, driven from the crank end by a pinion of smaller size than the pinion upon the shaft of roll C, and the lower roll D, driven from the opposite end by suitable connecting mechanism, to obtain the required purchase, substantially as and for the purpose set forth.

5,219.—*Manufacture of Spring-Heads.*—GEORGE HOPSON, Bridgeport, Conn.—Patent No. 116,311, dated June 27, 1871.

The clips of sheet-iron are cut to such shape that when folded around the leaf their edges on the one side shall not lie opposite their edges on the other side, and the welding-dies are so shaped as to throw up a stop-ridge on the iron across the inner surface, and two longitudinal ridges for supplying metal to fill out the corners when the ears of the clip are bent down by the finishing-dies, which latter also imparts the proper shape to the ears, carves the end of the leaf to correspond to the curl of the male leaf, and shears off any surplus metal from the portion so curved.

Claim.—1. The within-described method of forming the ridge or stop a^4 on the inner face of the female head by means of the die T with its recess *m* in connection with the die S, as shown and described.

2. The within-described method of welding the clips to the spring, forming the several projecting ribs thereon and imparting to the spring-head the proper finished shape by the dies M N and S T, as described.

3. The extension of the clips B across the inner face of the spring, as shown.

4. The clips B, of the shape described, jointly with the implacement and attachment of them to the leaf A, as described.

5,220.—*Valve for Water-Pipes.*—WILLIAM KEARNEY, Belleville, N. J.—Patent No. 57,930, dated September 11, 1866.

The valve is arranged to open by descending into a chamber below the water-ways, whereby sticks, stones, and other foreign substances are prevented from interposing and interfering with the perfect closing of the valve at all times.

Claim.—1. The combination of the box A, flanges B B, and valve C, when said parts are relatively arranged as described, and for the purpose set forth.

2. The combination of the valve C, box A, flanges B B, screw D, worm-wheel H, and screw I, all arranged to operate substantially in the manner as and for the purpose specified.

5,221.—*Portfolio.*—JOHN C. KOCH, Brooklyn, N. Y.—Patent No. 32,374, dated May 21, 1861.

The barbed needles are passed through the papers being filed, and attached to a suitable catch on the end of an elastic band secured to back of portfolio.

Claim.—The needles *e* having spear-heads, in combination with the loops or catches *i*, elastic bands *f*, cords *d*, and eyes *h* upon the cover of the portfolio or binder, substantially as and for the purposes specified.

5,222.—*Boring-Machine.*—ANDREW P. MERCHANT and MARIA MERCHANT, administrators of N. R. MERCHANT, deceased, and ANDREW P. MERCHANT, assignee of part interest to said N. R. MERCHANT, Guilford, N. Y.—Patent No. 32,449, dated May 28, 1861.

The boring-bits *m m* are made adjustable to and from each other by means of the arms E E, while their driving-pinions remain in gear with the wheel.

Claim.—1. The means described for operating two or more bits simultaneously, consisting of holders *g*, pinions *h*, and internally-cogged wheel D, applied as described.

2. The means of regulating the distance apart of the bit-holders *g*, consisting of the arms E, adjustable in the slot *d* of a plate, B, as set forth.

3. The means for supporting the bit-holders in different positions, consisting of the stands C, adjustable in slots *b* of plate B, as described.

5,223.—*Clothes-Wringer.*—ALBY H. PAGE, Manchester, N. H., assignor, by mesne assignments, to THE METROPOLITAN WASHING-MACHINE COMPANY.—Patent No. 61,660, dated January 29, 1867.—Division A.

A suitable frame with two rollers covered with elastic material; a pressure-bar adjusted by a central screw; two clamping devices, one swiveled at the feet of each standard for attachment at the edge of a tub.

Claim.—1. In a wringer having a pair of squeezing-rollers and an operating-crank and two uprights or standards, the employment of clamping means arranged to take hold of the tub at or near the base of each standard.

2. The construction of the clamping devices each with three fingers adapted to apply two on one face and one on the other face of the tub, as and for the purposes specified.

3. The application of a clamping device to a wringer with a swivel-joint to adapt itself to tubs of various forms.

5,224.—*Clothes-Wringer.*—ALBY H. PAGE, Manchester, N. H., assignor, by mesne assignments, to THE METROPOLITAN WASHING-MACHINE COMPANY.—Patent No. 61,680, dated January 29, 1867.—Division B.

The rollers are adjusted for different thicknesses of material pulled between them by a tilting bridge or bar, and a screw within the frame, and a means for clamping the wringer to a tub.

Claim.—The tilting bridge F and adjusting means E, in combination with the elastic rolls and also with a portable frame and clamping means for attaching to a tub, as specified.

5,225.—*Clothes-Wringer.*—ALBY H. PAGE, Manchester, N. H., assignor, by mesne assignments, to THE METROPOLITAN WASHING-MACHINE COMPANY.—Patent No. 61,680, dated January 29, 1867.—Division C.

Claim.—1. In combination with elastic rolls mounted in a portable framing, with means for connecting and disconnecting the framing on the edge of a tub, an incline arranged beneath the rolls, adapted to conduct the water therefrom inward toward the center of the tub, as specified.

2. The arrangement of the clamping-fingers L L and tightening means N relatively to the framing B and rollers D D, so that when clamped upon a tub the water expressed by the rollers shall tend to fall within the interior of the tub independently of the incline C', as herein specified.

5,226.—*Horse-Power.*—HEMPHILL SMITH, Shelby Station, Tenn.—Patent No. 120,678, dated November 7, 1871.

A draft-rope and windlass fixed upon a frame, and a draft-weight to counterbalance the whole, operated by horse-power working on a movable platform.

Claim.—1. The draft-rope F and windlass G applied to the frame C of a horse-power, substantially as and for the purpose specified.

2. The draft-weight H applied to the horse-power, in combination with the rope F, as specified.

3. The horse-power wheel A having the bent wood rim A', with the teeth bolted thereto, substantially as described.

5,227.—*Seed-Separator.*—WILLIAM J. WALKER, Dorset, Ill.—Patent No. 86,332, dated January 26, 1869.

Rack at tail of shoe and over spout, allowing the tailings to fall through into spout. Wind-board arranged at tail of sieve and front of spout to prevent blast passing up through rack.

Claim.—1. The wind-board L, located substantially as and for the purpose specified.

2. The rack E in combination with the wind-board L, substantially as and for the purpose specified.

5,228.—*Machine for Cutting Lead-Pencils.*—ALBIN WARTH, Stapleton, N. Y., assignor to EBERHARD FABER.—Patent No. 43,267, dated June 21, 1864.

The pencils are thrown into a hopper, from which they pass, one at a time, to a revolving carrier-wheel, which presents their ends to a rotating circular knife, thus trimming both ends of the pencil at one operation.

Claim.—1. A machine constructed, arranged, and operating substantially as herein described, for cutting off the ends of lead-pencils.

2. The arrangement of an agitator acting on the pencils contained in the hopper-box of the cutting-machine, substantially as described.

3. In combination with the pencil-containing hopper-box, a pencil-carrier, E, provided with sockets f^4 to receive the pencils from the hopper and to expose them in succession to the action of the cutter I, substantially as set forth.

4. The elastic fingers or wipers at the bottom of the hopper-box, in combination with the moving carriers, substantially as and for the purpose described.

5. In combination with the pencil-supporting hooks at the discharge of the hopper-box, the arrangement of scrapers projecting from the moving carriers and serving to throw the pencils out of said hooks into the sockets of the carriers, substantially as set forth.

6. The combination of adjustable heads E with the moving pencil-carriers, so that said carriers can be adjusted for pencils of different length.

7. The combination of a revolving cutter, I, with a moving pencil-carrier, E, the cutting-edge of the cutter being made to co-operate with the outer edge of the pencil-receiving sockets in the carrier, substantially in the manner described.

8. The combination of the bracket f^5 with the gages F F', the pencil-carrier E, and with a revolving cutter, I, substantially as specified.

9. The arrangement of a belt extending partially round the pencil-carriers and serving to hold the pencils down during the operation of cutting and to carry them away from the carriers after they have been cut, substantially as described.

10. The arrangement of clearers extending beneath the pencils contained in the moving carrier and serving to disengage said pencils from the carrier at the proper time, substantially as set forth.

11. The combination of an oscillating and yielding sharpening-wheel, J, with the revolving-cutter I, substantially as described.

INDEX OF INVENTIONS PATENTED JANUARY 7, 1873.

[The numbers in parentheses denote the classification of patents.]

Acid gas, apparatus for treating cane juice with sulphurous, (133,) J. Dymond 134,153
Bag holder, (57,) J. B. Brown 134,637
Bag fastening, mail, (102,) W. J. Stowell 134,571
Bayonet attachment, (55,) J. W. Nell 134,608
Bed bottom, spring, (62,) J. L. Secomb 134,614
Bee hive, (9,) D. Loofbourrow 134,687
Bee hives, honey box for, (9,) Johnson and Barker 134,674
Bell ringer, steam, (24,) West and Parker 134,719
Blower for grates, shade and draft, (154,) F. McCarthy 134,556
Boiler, steam, (146,) F. A. Woodson 134,720
Boiler, sectional steam, (148,) Babcock and Wilcox 134,505
Bone black, revivifying, (155,) A. Lonsky 134,686
Book, memorandum, (146,) H. M. Hinsdill 134,546
Boot and shoe heels, manufacture of, (16,) C. W. Glidden 134,538
Boots and shoes, machine for making shank pieces, (16,) C. H., D. D., and F. M. Blake 134,584
Boring machine, (173,) N. R. and A. P. Merchant, (reissue) 5,222
Bottles, stopper for volatile salts, (1,) A. Hebbard 134,600
Bracelet fastening, (86,) F. Kursh 134,681
Brick machine, (26,) E. R. Hubbard 134,672
Bridle bit, (72,) J. Letchworth 134,684
Burial casket, (39,) S. Stein 134,570
Canal boats, propelling, (139,) A. Ames 134,504
Canal boats, construction of, (138,) G. B. Martin 134,555
Cane juice with sulphurous acid gas, apparatus for treating, (155,) J. Dymond 134,655
Car coupling, (122,) J. W. Bates 134,629
Car coupling, (122,) J. L. De Good 134,648
Car coupling, (122,) C. H. Kendall 134,676
Car coupling, (122,) B. Moore 134,695
Car coupling, street, (122,) J. Stephenson 134,616
Car frame, (122,) R. M. C. Parker 134,701
Car spring, (122,) J. W. Culmer 134,646
Car spring, railroad, (122,) J. W. Culmer 134,645
Car axle body, (122,) H. G. Downs 134,594
Car axle, lubricating, (122,) J. R. Morris 134,696
Car seat, railroad, (121,) A. Barney 134,627
Carriage, baby, (31,) C. H. Amidon 134,623
Carriage, child's, (31,) J. A. Bechler 134,630
Carriage, child's, (31,) J. B. Wightman 134,576
Carriage seat, (31,) C. K. Mellinger 134,692
Carriage spring, (31,) J. W. Post 134,703
Centrifugal apparatus for extracting honey from the comb, (9,) W. Probasco 134,561
Chair, (62,) L. Heywood 134,545
Chair, baby's, (62,) P. Henrichs 134,668
Chair frame, (62,) Heywood and Horton 134,544
Chair, rocking, (62,) G. E. Lord 134,688
Chair seat and back, (62,) W. T. Doremus 134,593
Chair, table, and bureau, combined, (62,) H. Martindale 134,691
Chandelier, (90,) N. L. Bradley 134,585
Chimney top, (166,) H. Palmer 134,700
Clamp, pole, (39,) H. Haering 134,598
Clothes wringer, (91,) T. O. Bogert 134,633
Clothes wringer, (91,) J. Brinkerhoff, (reissue) 5,218
Clothes wringer, (91,) Gault and Winall 134,658
Clothes wringer, (91,) A. H. Page, (reissue) 5,223, 5,224, 5,225
Clothes wringer, (91,) R. S. Cathcart 134,641
Collar, (109,) J. T. Bruen 134,638
Cradle, (62,) M. Griffin 134,661
Crimping and fluting machine, (16,) R. Werner 134,621
Cultivator, (43,) W. G. Halburt 134,662
Cultivator, (43,) J. M. Heiges 134,665
Cultivator, (43,) J. Sherrill 134,615
Cultivator, cotton, (43,) Bell and Winfield 134,632
Currents of rivers, utilizing the, (168,) E. Valade 134,618
Derrick and crane, (73,) J. W. Kennedy 134,677
Door check, (94,) G. Rohrbaker 134,612
Door, hanging, (30,) G. Heegler 134,542
Drawing board, (54,) T. H. Kane 134,550
Drier, (48,) Gibbs and Borwick 134,650
Drills, guide for rock, (194,) A. Ball 134,506
Electric measurement, apparatus for, (60,) L. Bradley 134,656
Elevator brake, (79,) F. P. Canfield 134,640
Elevator guide, (79,) C. R. Otis 134,698
Engine, hydraulic, (116,) R. F. Dobson 134,651
Engine, steam pumping, (118,) A. J. L. Lorets 134,689
Exercising apparatus, (143,) H. E. Eastman 134,597
Fabrics for scouring and percolating purposes, metallic, (57,) A. J. Vandegrift 134,619
Fan, automatic, (165,) A. P. Heidt 134,543
Fan, automatic, (165,) Lawrence and Sanders 134,605
Fence, adjustable picket, (52,) J. S. Anderson 134,624
File, bill and letter, (146,) A. J. Marshall 134,554
Fire alarm signal box, (30,) F. Latta 134,552
Fire arm, magazine, (16,) A. Burgess 134,509
Flour, machine for preparing, (57,) L. S. Chichester 134,513
Flowers, bleaching, &c., dried natural, (54,) J. W. and M. L. Ware 134,714
Fruit drier, (46,) A. Edwards 134,598
Fruit cans, tongs for lifting, (86,) A. H. Johnson 134,604
Gearing, (67,) E. G. Chormann 134,642
Generator, steam, (150,) J. W. Bookwalter 134,635
Girders, apparatus for testing, (97,) P. H. Jackson 134,549
Grates, shade and draft blower for, (154,) F. McCarthy 134,558
Guitar, (102,) R. Knaff 134,679

Harvester, (74,) J. Farrington 134,591
Harvester, corn, (75,) W. H. Kenyon 134,678
Harvester, hemp, (75,) P. S. Fitch 134,656
Harvester platforms, adjustable grain wheel for, (74,) G. M. Patten 134,610
Heater, feed water, (148,) Boody and Merrill 134,634
Hinge, (24,) F. Müsser 134,697
Hinge, butt, (24,) I. L. Thompson 134,617
Honey from the comb, centrifugal apparatus for extracting, (9,) W. Probasco 134,561
Horse manger, (144,) J. C. Higginga 134,601
Horse power, (150,) L. H. Bratt 134,510
Horse power, (150,) L. Bronson 134,511
Horse power, (150,) H. Smith, (reissue 5,226
Horses, sun shade for, (72,) S. Ruth 134,564
Horseshoe nails, hemmer roll device for, (60,) Harris and Dunn 134,664
Hose suction, (81,) W. C. Downs 134,654
Husker, corn, (59,) J. M. Carlisle 134,590
Inkstand, (146,) W. M. Brooke 134,587
Isinglass, manufacture of, (26,) J. Manning 134,690
Jack, lifting, (79,) W. F. Arnold 134,625
Jack, lifting, (79,) J. W. Shankland 134,709
Jack, self-acting spinning, (142,) J. Shaw 134,567
Keys for locks, manufacture of, (24,) W. Wilcox 134,577
Knobs to spindles, attaching, (93,) S. Selden 134,708
Lamp, (90,) R. Hitchcock 134,547
Lamp burner, (90,) T. W. Gardner 134,657
Lamp burner, (90,) M. J. Wellman 134,718
Lantern, (90,) H. Beebe 134,631
Loom, (95,) S. T. Thomas 134,572
Lubricator, (87,) J. McL. Power 134,611
Lumber drier, (48,) A. Edwards 134,529
Marble molding machine, (153,) J. Finn 134,532
Match safe, (90,) L. Darozir 134,523
Match cutting machine, (174,) T. G. Murphy 134,565
Mattress stuffing, &c., preparing moss for, (62,) A. Rock 134,562
Medical compound, (98,) W. Campbell 134,639
Mill, fanning, (159,) G. E. Clarke 134,643
Molding, rolled iron, (4,) Manly and Sellers 134,553
Molding marble, machine for, (153,) J. Finn 134,532
Moldings, tilling, polishing, and varnishing, (107,) Hamburger, Siskind, and Klein 134,509
Music portfolio, (102,) F. C. Schumann 134,613
Music rack, (104,) C. L. Ely 134,530
Music leaf turner, (102,) L. F. Morawetz 134,557
Nail clincher, (60,) J. Kunz 134,660
Nail plating, (103,) T. O'Gara 134,560
Nut, (14,) F. L. Delfer 134,649
Organ, reed, (106,) W. H. Gerrish 134,536
Organ case, cabinet, (106,) A. J. Sorensen 134,569
Paint, fire proof, (107,) C. P. Crossman 134,522
Paper bags, machine for making, (109,) C. F. Annan 134,580
Patterns to their supporting plates, attaching, (33,) J. H. Harper 134,663
Pavement, (110,) M. E. Worrell 134,622
Pearl finish on metallic surfaces, producing, (113,) Beiderhase and Witteck 134,581
Pencils, machine for cutting lead, (174,) A. Warth, reissue 5,228
Photographic plate holder, (111,) J. Buchtel 134,512
Physical culture, apparatus for, (143,) G. B. Windship 134,578
Pictures, coloring, (113,) C. J. Mettais 134,693
Pipe for aerated liquids, draft, (1,) O. F. Stedman 134,710
Pitcher cover, (88,) W. Bradley 134,586
Planter, corn, (133,) W. J. C. Crandall 134,521
Plow, (114,) R. G. Hobson 134,670
Plow, (114,) W. M. Watson 134,716
Plow, gang, (114,) G. A. Groves 134,540
Portfolio, (146,) J. C. Koch, (reissue) 5,221
Pot, coffee, (136,) R. J. Childs 134,514, 134,515
Pot, coffee, (136,) E. H. Hinch 134,603
Preserving canvas and cordage, solution for, (35,) C. Nelson 134,559
Press, cotton, (7,) P. K. Dederick 134,592
Printing press, chromatic, (117,) G. W. Woodside 134,579
Printing press, hand, (117,) N. Ross 134,705
Printing press attachment, chromatic, (117,) E. A. Howitt 134,602
Pruning shears, (63,) O. Chase 134,591
Pump, (118,) J. S. Barden 134,626
Pump, steam vacuum, (118,) Simpson and Drake 134,568
Railroad snow ram, (122,) W. C. A. Frerichs 134,595
Refrigerator, (58,) S. E. Condon 134,644
Rendering, machine for cutting up fat meats for lard, (25,) Weber and Siefert 134,717
Revenue, apparatus for production of spirits and the prevention of fraud upon the, (47,) J. Dawson 134,524
Roof covering, (126,) R. U. Piper 134,702
Safe, fire proof, (128,) J. W. Warner 134,574
Sash holder, (24,) E. W. Warren 134,715
Satin finish on metallic surfaces, producing, (113,) Beiderhase and Witteck 134,582
Saw guide, (130,) P. Tryibil 134,704
Saw scroll, (130,) W. H. Doane 134,650
Saw mill dog, (130,) H. D. Donn 134,653
Saw swaging device, (131,) C. F. Henis 134,666, 134,667
Seed separator, (159,) W. J. Walker, (reissue) 5,227
Separator for thrashing machines, (159,) G. W. Howe 134,671
Sewing machine, wax thread, (134,) E. E. Bean 134,508
Sewing machine, wax thread, (134,) E. E. and F. Bean 134,509
Sewing machine motor, (134,) W. R. Dunton 134,596
Sewing machine thread cutter, (134,) F. Colline 134,518
Sewing machine thread cutter, (134,) Henry and Wood 134,669
Sewing machine shuttles, die for forming, (134,) D. W. Hale 134,541
Sewing machine button holing attachment, (134,) E. Moreau 134,558
Sewing machines, thread waxing attachment for, (134,) C. E. Lewis 134,606
Shoe and leather polisher, (16,) J. Day 134,525
Shovel, ash lifting, (154,) G. W. Dean 134,647
Sickle bars, attaching pitmen to, (67,) V. Cox 134,519
Skiving counters, machine for, (16,) C. Keniston 134,551
Soap and other material, apparatus for mixing, (26,) C. J. Schultze 134,706
Spinning rings, restoring ring traveler, (142,) F. Tully 134,712
Spinning frames, spindle and bobbin for, (142,) R. Garsed 134,535
Spools, mandrel for making, (175,) J. W. Foster 134,534
Spring, corset, (80,) S. H. Barnes, (reissue) 5,216
Spring heads, manufacture of, (31,) G. Hopson, (reissue) 5,219
Spring for vehicles, (31,) F. K. John 134,673
Spring motive power, (67,) T. B. Fogarty 134,533
Staves, machine for jointing, (40,) S. S. Gray 134,596
Staves, machine for crozing and chamfering, (40,) S. S. Gray 134,597
Steam hoisting apparatus, (150,) C. R. and N. P. Otis 134,699
Steel, manufacture of, (85,) H. A. Levallois 134,685
Steering apparatus, (139,) D. N. B. Coffin, Jr 134,516
Stone, &c., composition for forming, (153,) J. J. Bartlett 134,628
Stove, heating, (134,) W. B. Treadwell 134,573
Stove, reservoir cooking, (154,) H. Lappin 134,683
Stove board and floor protector, metallic, (154,) P. H. Rose 134,563
Stove for heating soldering irons, vapor, (154,) D. Berkey 134,583
Stump extractor, (79,) E. Bayliss 134,507
Sugar, manufacture of loaf, (135,) E. Langen 134,682
Sugar into blocks, cutting, (135,) Brunjes and Bennecken-dorf 134,588
Table slide, extension, (62,) G. W. Townsend 134,711
Tannin, extracts, &c., apparatus for making, (35,) Johnson and Goodell 134,675
Thrashing machine, (159,) D. C. Baughman, (reissue) 5,217
Tobacco pipes, compound for use in, (160,) W. E. Turner 134,713
Tongs for lifting fruit cans, (86,) A. H. Johnson 134,604
Track clearer, (122,) A. J. Gove 134,660
Trap, animal, (143,) J. W. Greene 134,539
Trap, stench, (8,) P. W. Doherty 134,652
Truck, hand, (31,) L. Gilson 134,537
Valve, check, (148,) J. C. Hoadley 134,548
Valve for water pipes, (167,) W. Kearney, (reissue) 5,220
Vat for coloring wool and cotton, indigo blue, (11,) G. Molt 134,694
Vault, fire proof, (128,) J. W. Warner 134,575
Veterinary operations, holding hogs in, (144,) Scott and Wilson 134,707
Washboard, (91,) J. T. and F. T. McNally 134,607
Washing machine, (91,) A. M. Olds 134,699
Wheel, paddle, (139,) Walker and Holbrook 134,630
Wheel, water, (168,) G. Cox 134,520
Windlass, (79,) D. N. B. Coffin, Jr 134,517
Writing tablets, coating for, (146,) A. Schindler 134,566

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 7, 1873.

Allis, H., assignee 134,596
Ames, A., Propelling canal boats 134,504
Amidon, C. H., Baby carriage 134,623
Anderson, J. S., Adjustable picket fence 134,624
Annan, C. F., Machine for making paper bags 134,580
Arnold, W. F., Lifting jack 134,625
Babcock, G. H., and S. Wilcox, Sectional steam boiler 134,505
Ball, A., Guide for rotary rock drills 134,506
Banes, C. H., assignee 134,712
Barden, J. S., Pump 134,626
Barker and Johnson 134,674
Barnes, S. H., Corset spring, (reissue) 5,216
Barney, A., Railroad car seat 134,627
Bartlett, J. J., Composition for forming stone, &c 134,628
Bates, J. W., Car coupling 134,629
Baughman, D. C., Thrashing machine, (reissue) 5,217
Bayliss, E., Stump extractor 134,507
Bean, E. E., Wax thread sewing machine 134,508

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus 1
Air and gas engines 2

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. Fifty-two volumes per year (an issue takes place every Tuesday) was found to fill up the shelves of the libraries so fast as to make the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office; and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

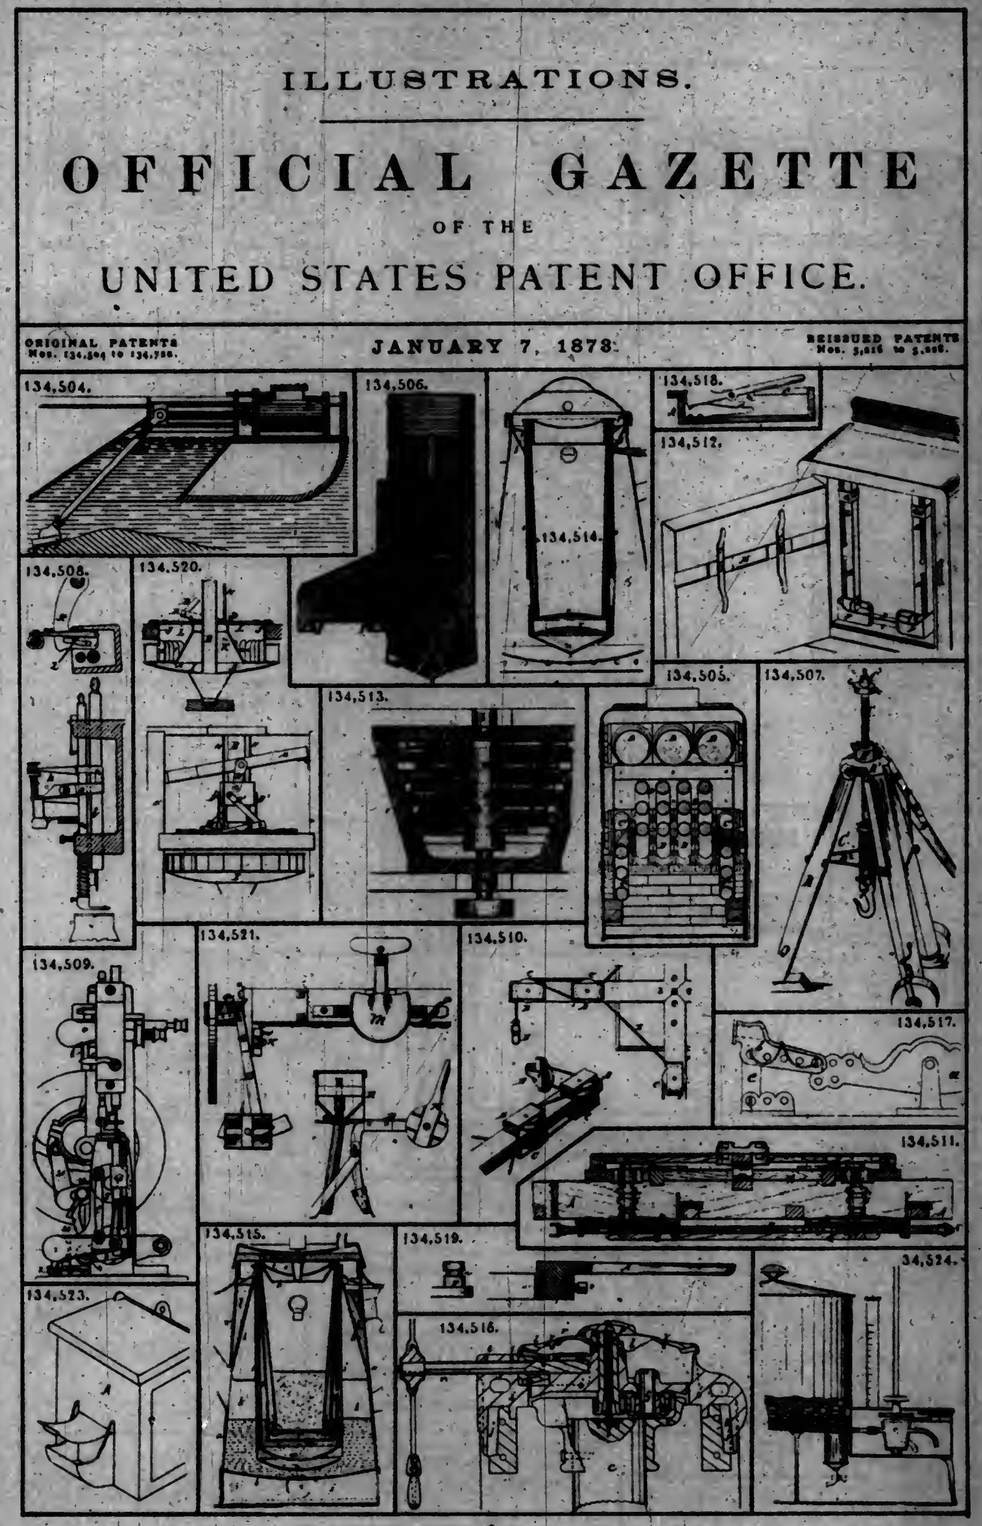
The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	



The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COMMISSIONER'S DECISIONS.

T. PLUMLEIGH.—*Reissue.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Thomas Plumleigh for reissue of patent No. 123,231, granted January 30, 1872, for* IMPROVEMENT IN HARVESTERS.—*Decided January 18, 1873.*]

A case showing but a colorable variation, or inversion of a previous arrangement of similar parts.

LEGGETT, *Commissioner:*

Applicant's claim gives an intelligible idea of his invention, and is as follows:

"The driving-wheel herein described, having a series of removable anti-friction rollers and pendant flanches to serve as bearings for such rollers, as shown, in combination with the reciprocating bar F, the several parts being constructed and arranged substantially as specified."

I regard the references cited by the Examiner as fully anticipating this alleged invention. In the patent of G. W. Richardson of July 19, 1859, for instance, the friction-wheels are carried by the reciprocating bar instead of the driving-wheel. Applicant reverses the arrangement and places his friction-wheels on the flange of the driving-wheel. In Carmeau's case applicant's arrangement of parts is shown, except that a separate wheel is employed. In view of the state of the art as exhibited by these and the other references cited, applicant presents only a colorable variation or equivalent construction. The advantages, he alleges, are not exclusively found in his device, and I see nothing to warrant the grant of a patent in what he has done.

The decision of the Board is affirmed.

W. M. C. CUSHMAN.—*Extension.*

[*In the matter of the application of W. M. C. Cushman for the extension of Letters Patent No. 22,631, for* IMPROVEMENT IN RAILROAD-CHAIRS, *granted January 18, 1859.—Decided January 17, 1873.*]

A case in which the original patent had but slight novelty, and the rights thereunder have not been prosecuted with diligence.

THACHER, *Acting Commissioner:*

The Examiner reports in this case as follows:

"This patent is considered to be of trivial and nominal character. The invention as originally specified was placed in interference with a number of other applications, upon decision of which priority was awarded to Henry A. Landry, who accordingly took out his patent January 18, 1859, (No. 22,656.) The invention consisted in enlarging the outer portion of the railroad-chair and elevating it to the level of the rail, so as to take the tread of the wheel at the joint, and thus protect the same from wear. In addition to this there was a claim in the present application for making the "flanch" or rib with "buttresses," instead of solid—a matter of configuration, incidentally described and shown as a construction which might be adopted, but non-essential. Upon the adverse decision of the interference the original specification was cancelled by amendment, together with the leading claim, and a new specification filed describing and laying claim to this feature alone, the principal figures showing Landry's invention meanwhile being allowed to stand in the drawing, although Fig. 4 was the only one relating to this alternative or referred to originally as embodying it. Upon analyzing this matter of configuration, thus magnified into an original invention, its novelty is non-apparent, and it is difficult to see why this claim was not considered settled by the interference decision as well as the other. Landry's drawing certainly shows a construction in all respects equivalent, mechanically and functionally; and if this is not enough, other parties show it still more closely, particularly William Kearney, (application filed January 22, 1858,) one of the parties to the interference. This application antedates the present one in time of filing by more than four months. If the point was patentable, or so regarded, it is not seen why its proprietorship was not determined by an interference between these two parties

who show it equally well. But the railroad-chair patented to Adam Hays September 7, 1858, also shows that cutting away the middle outer portion of the iron of the chair to leave the so called buttresses was an old idea, even if such a privilege is not a part of every iron-molder's craft since the days of Tubal Cain.

"The applicant's record is equally lame. We find that his efforts and expenses to give the invention to the public, over and above the cost of obtaining the patent, were confined to ($100) one hundred dollars' worth of advertising. His receipts have been nothing.

* * * * * * * *

"With regard to the effect of the proposed extension upon the public interest, judging from the past history, no effect, favorable or unfavorable, would ensue. Not one cent has yet been collected, or apparently been attempted to be collected, during the whole period of the contract with the public. It is possible that a *second* indorsement by the Patent Office, such as an extension is, and with the weight it carries, might in the hands of a smart operator galvanize the so-styled invention into such semblance of life as to give some trouble to some unwary road which has chanced to mold its chair-castings into a form resembling this, as it is an extremely obvious one to a mechanic, and clearly public property.

"Summary—

"1. The invention had no substantial novelty at the date of patent.

"2. It therefore has no value or importance to the public as a monopoly.

"3. The applicant's failure to obtain any remuneration during the life of the patent has arisen either out of the intrinsic weakness of his case or lamentable neglect in prosecuting it.

"4. The public interests cannot be favorably affected by the extended life of such a patent."

There seems to be no occasion for adding anything to the statement made in this report, and it is therefore adopted as in substance the decision in this case. As the application possesses no merit in any of the particulars required for the granting of an extension, the prayer of the petitioner must be denied.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—EASTERN DISTRICT OF MICHIGAN.

PALMER HAMILTON *vs.* CALEB IVES & GEORGE B. GREEN.

[*Decided January* 16, 1873.]

Motion for new trial on the grounds, first, of newly-discovered evidence; and second, erroneous instructions to the jury. The first ground was disposed of at the hearing, adversely to the motion, the showing upon which it was based being clearly insufficient. The motion was held under advisement, and is now for decision on the second ground alone.

[*G. V. N. Lothrop* for the plaintiff.
Charles J. Hunt for the defendants.]

LONGYEAR, *J:*

The action in this case was for an alleged infringement of a patent, No. 51,310, granted to the plaintiff December 5, 1865, for an improvement in saw-mills. The device patented consists of a new combination of old elements as a means of producing a certain result, and is set up in the claim in the following words:

Having thus described the best mode with which I am acquainted of embodying my improvements, what I claim as my invention, and desire to secure by letters patent, is giving to the saw in its downward movement a rocking or rolling motion, by means of the combination of the cross-head working in curved guides at the upper end of the saw, the lower end of which is attached to a cross head working in straight guides and pivoted to the pitman below the saw, with the crank-pin, substantially as described.

In the drawings, the curved guides are represented as set with their concave facing in the same direction as the cutting-edge of the saw, and consequently toward the approach of the log, which is represented in the drawings by an arrow marked S; and they are referred to in the specifications as being so set. Nothing whatever is said in the specifications as to whether the curved guides are to be set with the lower end perpendicularly under the upper end, or in an inclined position, they being entirely silent upon the subject. In the drawings, however, they appear as if set in a perpendicular position, and on this account it was claimed at the trial that any other position of the guides was not covered by the patent, and that because in the combination, as used by the defendant, these guides were set with the lower end about two inches forward of a plumb line let fall from the upper end (as to which there was no dispute) there was no infringement. The defendants' counsel asked the Court to charge the jury as follows: "That if the face of the slides are not placed so that the top and bottom of the slides are in the same perpendicular line there is no infringenent." The Court refused to charge as requested, and charged the jury as follows:

"That the plaintiff is entitled to the protection of his patent, no matter whether the curved slides be set in one line or in another, provided the combination is otherwise complete. It is a mere matter of adjustment which any competent mechanic, skilled in building saw-mills and adjusting the saw for the most effective service, would readily understand and adopt."

This refusal to charge, and the charge as given, are claimed to be erroneous, and constitute the only grounds of the present motion, as I construe the three several subdivisions or grounds of motion, as spread upon the record. The grounds of motion as stated upon the record are as follows:

"1. In this, that the Judge charged the jury that the patent of Hamilton did not require the slides to be set perpendicular.

"2. In this, that the Judge charged the jury that, under Hamilton's patent, the slides could be set in any position, at the choice of the mechanic who set them up.

"3. In this, that the Judge charged the jury that, if the slides of Ives and Green fell back from a straight line drawn from one end of the slide to the other, it was an infringement on the Hamilton patent."

The first and second, although not in the language of any charge as given, clearly have reference to the charge above quoted. But on a careful examination of the whole charge, which was in writing, I am unable to find any portion of it which authorizes the statement contained in the third subdivision. No such charge was given. I do not intend to accuse counsel of intentional misstatement, but that there was a misapprehension on the part of the counsel there can be no doubt. The fault of the counsel is that he evidently made his statements as to what charges were given without resort to the written charge to ascertain their correctness.

The question of decision, then, is as to the correctness of the instruction above quoted.

It is claimed that because the curved guides at the upper end of the saw are represented in the drawings as set in a perpendicular position no other position of the guides, even if the combination be the same in all other respects, is covered by the patent; and that, therefore, the use by defendants of a like combination, but in which the upper guides are set with the lower ends two inches forward of a perpendicular line let fall from the top ends, is no infringement of the plaintiff's patent.

It is to be observed: 1. That the curved guides are not themselves claimed as new, and, of course, they are not covered by plaintiff's patent. 2. That it is only the position and office of the curved guides in the combination that are patented. 3. That the only respect in which the position of the curved guides in the combination is made specific, or is at all essential, is their location in reference to the saw—that is, at its upper end, and with their concave sides toward its cutting-edge, or, as it is expressed in the specifications, "to the advance of the log." 4. That the only office to be filled by the curved guides is to carry the top end of the saw backward of its general line of movement, or, as substantially expressed in the specifications, in the same direction as the advance of the log during the first half, and forward, or toward the log, during the last half of its downward motion, while at the same time, by another part of the combination, the lower end of the saw is being carried in the opposite direction, thus doing their part in imparting to the saw the "rocking or rolling motion," mentioned in the claim as above quoted.

We see, then, that so far as the specifications are concerned, nothing is specified as to whether the curved guides are to be set perpendicularly or inclined, and if inclined, at what angle or how much. So far as the the specifications are concerned, then, this matter was certainly left to be adjusted according to the judgment of the builder for the most effective service. This being the case, and it being the intention of the patentee so to leave the matter, the curved guides could not be represented in the drawings in any other than a perpendicular position, because that is the only initial or starting point or line from which any divergent or inclined position could be calculated. The drawings are intended to represent the positions of the individual parts *in the combination*, and not mere matters of detail. For instance, the saw is as much a part of the combination as the curved guides. In the drawings, the saw is represented as hung in a perpendicular position. The evidence of all the experts show, and it is undisputed, that no saw-mill, no matter what combinations or devices are used in other respects, will do effective work without what is called "overhang" of the saw, or its equivalent—that is, the saw must be so hung that when its downward stroke is completed the upper end shall overhang the lower end with reference to a perpendicular line. Now, it might as well be said that a saw-mill built after plaintiff's device is not an infringement of his patent because the saw has the necessary overhang, as to say it is not an infringement because the curved guides are not set perpendicularly. In fact, the testimony of the experts tended to show that setting the lower end of the curved guides forward was but one method of giving the saw the necessary overhang. The matter as to how the curved guides shall be set is left unlimited and undefined, like a score or more of other matters of detail, such as their length and degree of curvature, the length and thickness of saw-plate, the length and number of saw-teeth, length of stroke of the crank, length of pitman, length of leverage at the upper end of the pitman between where it is pivoted to the lower cross-tree and where the saw is pivoted to it, &c. All these are clearly mere matters of adjustment, and may be varied in different cases according to the intelligence, judgment, or even caprice of the builder, and still the combination be the same, and in each case equally covered by the plaintiff's patent. (*Am. Hide, &c., Co. vs. Am. Tool, &c., Co.*, 4 Fish Pat. Cases, 284, 304, 307.)

The drawings are no doubt a part of the description of the thing patented, but they must be considered in connection with the specifications. Where the invention patented consists, as in this case, of a combination of old elements to produce a new result, mere matters of adjustment of the individual elements are not limited or controlled by the drawings, unless, 1: They are expressly so limited by the specifications as well; or 2: Such limitation and control are necessary to maintain the integrity of the specifications, taken as a whole, or of some essential part or parts thereof; or 3: Such limitation and control are essential to produce the result claimed. As to the first, we have already seen that the perpendicular position of the curved guides, as represented in the drawings, are not expressly limited to that position by the specifications. As to the second, it is claimed on the part of the defendants that the perpendicular position of the curved guides as represented in the drawings, is necessary to maintain the integrity of the following clause in the specifications, viz: "As the upper guides are concave to the advance of the log, the effect upon the upper end of the saw is that while it is descending it also moves in the direction of the arrow S," (the arrow S indicates the advance of the log;) "and it continues this movement as it descends until about half of the stroke is accomplished; then, during the remainder of the stroke, it moves in a direction the reverse of that indicated by the arrow S. It is claimed that inasmuch as the advance of the log is in a horizontal line the curved guides cannot be concave to it, in a strictly mathematical sense, unless the curves be so set that a straight line drawn from one end of the curves to the other, representing the chord of an arc of a circle, be perpendicular to such horizontal line. In order to have this true, even in a strictly technical sense, it is necessary that the curve of the guides should be in the exact form of an arc of a circle. But it is not so described in the specifications, neither is it necessarily so in order to maintain the integrity of any portion of the specifications, nor is it essential in order to produce the result claimed. All that is specified, and all that is essential, is that the upper guides shall be curved. The degree of curvature, and the shape or form of the curve, whether an arc of a circle or otherwise, are non-essentials, but are mere matters of adjustment, like the length and proportions of the connecting or pitman rod, &c. The foundation

of the argument in that regard is, therefore, lacking, and the argument falls to the ground. But, however this may be, the clause quoted does not purport to be, and it is not any part of the description of the combination, or of any portion of it. These had been already described. It is simply a description of the office or operation of this particular element, viz: of the curved guides.

It is claimed, however, that in order to maintain the integrity of the description of the office or operation of the curved guides, as stated in the specification above quoted, it is essential that the guides be set perpendicularly. In order to maintain this claim it is assumed that in order to have the upper end of the saw move in the direction indicated (in the same direction as the advance of the log) during the first half of its downward stroke it must fall back of a plumb-line let fall from its starting point, and that it cannot be made to do this if the lower ends of the curved guides are set forward of such plumb line. The fallacy of this assumption appears from the following propositions—1: The description is not that the upper end of the saw is made to move the one way or the other with reference to a plumb-line. 2: While it is true that, taken by itself, and without making any allowance for the operation and effect of the movement of the lower end of the saw in the opposite direction, the movement of the upper end, in order to be in the same direction as the advance of the log, must be a falling back from a plumb line, as claimed; yet, when taken in connection with, and as affected by that other movement, it is not necessarily so, even with the curved guides set perpendicularly. In this connection it must be borne in mind that the movements of the saw here spoken of all have direct reference to its operative effect upon the log, and, of course, when the "saw" is spoken of it must have reference to its operative or toothed edge, and the "upper" and "lower" ends of the saw must be understood to mean those ends of that edge or side, which, in practice, as is well known, always terminates several inches below and above the fastenings or hangings at the respective ends of the saw-plate.

It will be remembered that while descending, the two ends of the saw are moved back and forward in opposite directions at the same time—the upper end back by operation of the curved guides during the first half, and forward during the last half, and the lower end by operation of the lever connecting rod or pitman, forward during the first half and back during the last half of its downward stroke. Each of these movements, of course, affects the saw throughout its entire length, but with a gradually diminishing effect.

The description in the specifications of the operation and effect of each separate element or part of a patented combination must be read and construed with reference to the entire combination and its results, and the effect which the operation that each element or part has upon that of each of the others. (*Cahoon* vs. *Ring*, 1 Fish, Pat. Cases, 403, 419, 420.) So construing the description of the operation and effect of the curved guides now under consideration, it is evident that, while of course the cross-tree operating in the guides and to which the upper end of the saw-plate is pivoted, must fall back of a plumb line in the first half of the descent of the saw, the upper end of the saw itself—that is, the upper tooth or teeth of the saw—may be carried so far forward by the forward motion of the lower end as not to fall back of such line, but may on the contrary actually move in the opposite direction, depending, of course, upon the degree of curvature of the guides and the extent to which the lower end is thrown forward. This was in fact shown to be the case by experiments at the trial with a model constructed after the plaintiff's patent, the correctness of which was not disputed. But, as paradoxical as it may seem at first view, this does not prove, as claimed, that the statement in the specifications, that the upper end of the saw in the first half of its downward stroke moves in the direction of the advance of the log, is untrue. It simply proves that while it must necessarily so move, yet on account of another simultaneous movement, it is not thereby caused necessarily to, and does not in fact, fall back of a plumb line, even with the curved guides set perpendicularly, as represented in the drawings. This theory of there being a backward motion as the result of an individual cause, and an absolute forward motion as the result of compound causes, is well illustrated by the familiar example of a man starting on the bow of a moving ship and walking back along the deck to its stern. Now, suppose the ship to be moving forward at the rate of five miles per hour, and the man to move toward the stern at the rate of three miles per hour, the man will have actually gone forward of a plumb-line let drop to the ground from where he started, and yet, with reference to the ship, he actually moved the other way.

The backward movement of the upper end of the saw is caused, as we have seen, by the cross tree to which the upper end of the saw plate is pivoted following the curve of the guides. A completed downward movement of the cross-tree is, I think, correctly represented by a straight line drawn from the starting-point of the pivot to the point of the termination of the movement. Now, I think it evident that, if the curved guides are so set (no matter what their position may be in other respects) that this pivot or operating cause falls back of such straight line during the first half of its downward movement, the call of the specification in that respect is answered. The fact is, however, that this statement in the specifications as to the operation and effect of the curved guides upon the upper end of the saw is not descriptive of any part of the combination itself. It is a statement merely of the patentee's theory in that regard; and even if he was mistaken in that particular it would not invalidate his patent, because it is immaterial; provided, of course, that the entire combination actually produces the result claimed for it, as to which there is no dispute. (*Foss* vs. *Herbert*, 2 Fish, Pat. Cases, 31, 35.) "It is well settled by the courts," says Judge Leavitt, "that in the effort to ascertain the intention and meaning of the specifications and claims, they are to be viewed in a liberal spirit, that, if possible, the object of the inventor or patentee may be carried out. Mere rigid technicalities are to be set aside, unless there is a clear legal necessity for sustaining them." (*Goodyear* vs. *Berry*, 3 Fish, Pat. Cases, 439, 448.) I entirely concur in the proposition. See also *Imlay* vs. *Railroad Company*, 1 Fish, Pat. Cases, 340; *Goodyear* vs. *Railroad*, ib. 626; *Page* vs. *Ferry*, ib. 298; *Judson* vs. *Cope*, ib. 615; *Burden* vs. *Corning*, 2 ib. 477; *Beard* vs. *Edgerton*, 8 Mann, Gr. & Scott, 165; *Ames* vs. *Howard*, 1 Sum. 482, 485; *Blanchard* vs. *Sprague*, 3 Sum. 535, 539; *Ryan* vs. *Goodwin*, ib. 514; *Seymour* vs. *McCormick*, 2 Blatchf. 240, affirmed except as to rule of damages, 16 How. 483.

It appears, therefore, that the claim on behalf of the defendants, that the curved guides at the upper end of the saw must be set perpendicularly in order to maintain the integrity of the specification above quoted, has no foundation.

It remains to consider the third and last condition, viz: Whether it is essential to limit the curved guides at the upper end of the saw to a perpendicular position as represented in the drawings, in order to produce the result claimed for the entire combination. The result, as stated in the claim, is "giving to the saw in its downward movement a rocking or rolling motion."

These curved guides at the upper end of the saw, it must be borne in mind, perform only a part of the work of imparting to the saw the motion claimed to be imparted by the entire combination. How it performs that work we have already seen. Now, it is evident that any practical inclination of the guides from a perpendicular position—that is, any inclination that will allow the saw to respond to the entire revolution of the crank, and do effective work, which was shown in practical use to be from one to two inches only—would not destroy the effect of the curve of the guides upon the motion of the saw. It would no doubt somewhat modify and slightly diminish that effect, but it must be borne in mind that the motion claimed as the result of the combination is in no manner limited to any particular *degree* or *extent*. It is in *kind* only, and so long as the kind of motion claimed is produced by the combination described the combination is protected by the patent.

It follows, therefore, that there was no error in the instruction complained of, and the motion for a new trial must be denied, with costs to the plaintiff, including an attorney fee of $10.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

MARY F. McCOMB *vs.* IRA BEARD.

[In Equity.—Before Judge Blatchford.—January 9, 1873.]

FREDERIC COOK'S PATENT—COTTON-TIES.

The third claim of letters patent for "improvement in metallic ties for cotton-bales," granted to Frederic Cook, March 2, 1858, is for the cutting of the slit or slot through the outer bar of the clasp, (which covers the cutting it through an equivalent bar or part of the clasp,) so as to enable the part of the hoop which is to rest under a bar of the clasp to be slipped sidewise through the slit or slot, and avoid putting the end of the hoop endwise through beneath such last-named bar.

There is no connection between this claim and what is previously done with any other part of the hoop or any other part of the clasp; the claim is distinctly to the use of the slit or slot, so cut to effect the result indicated for the object indicated.

Such a claim is not anticipated by George Hall's English patent of 1801, by a quadrangular buckle with an open slot, having spikes at the sides of the gateway.

Nor by a split-ring for connecting trace chains.

Such claim is infringed by the tie shown in letters patent for an "improvement in cotton-bale ties" granted to George N. Beard, December 27, 1870, consisting of a quadrangular buckle with an opening in one of the side bars for the passage of the iron in the form of a hook.

This was a final hearing upon pleadings and proofs of a suit in equity, brought by Mary Frances McComb against Ira Beard, for the alleged infringement of letters patent for "improvement in metallic ties for cotton-bales," granted to Frederic Cook, March 2, 1858, and assigned to plaintiff.

[*Keller & Blake and Fisher & Duncan*, for complainant.

S. J. Gordon and J. H. B. Latrobe, for defendant.]

BLATCHFORD, *J.*:

This suit is brought on letters patent, owned by the plaintiff, granted to Frederic Cook, March 2, 1858, for an "improvement in metallic ties for cotton-bales." The patent was, on the 17th of February, 1872, extended for seven years from the 2d of March, 1872, but this suit is not brought on the extended term.

Cook's invention is a friction buckle or clasp to be used with an iron hoop or tie. The drawing of the patent represents the buckle as a flat rectangular plate, in length a little more than double its width, with three closed slots in it, parallel to each other, running crosswise of the plate, thus making four cross-bars, which bars are set off from the plane of the body of the plate, in alternation, the first and third bulging from one face of the plate, and the second and fourth from the other. Approaching the plate from either end of it, the end of the hoop is passed over the first bar, then under the second bar, then over the third bar, then around the further side of the third bar, then back again under the third bar, then under the hoop that is beneath the second bar, and then over the first bar and between it and the hoop that is above it, such end of the hoop being left to project. The buckle, with the hoop thus arranged in it, being laid on the cotton-bale with the long body of the hoop uppermost, and such body being cut off at the desired length for the bale, the hoop is brought around the bale, and the unconfined end is then passed under the fourth bar, then over the hoop that is above the third bar, then under the second bar and between it and the hoop that is beneath it, then around the end of the second bar, then back again over the second bar, then over the two hoops that are above the third bar, and then under the fourth bar and between it and the hoop that is beneath it, such end of the hoop being left to project. There are, thus, two loops in the hoop, one around the second bar, and one around the third bar, the first and fourth bars serving as friction-bars to prevent the loops from slipping, by tightly confining, between such friction-bars and the main body of the hoop, the parts of the hoop which are in contact with such friction-bars. The parts of the hoop which form the loops pass by each other, so that when the loops, by the strain of pulling on the hoop, are brought to pull against the bars, the tendency is to turn the buckle over, end for end, and such turning over is prevented only by the action before mentioned of the first and fourth, or outer or end bars, as friction bars. The hoop is arranged in the buckle while the bale is under compression in a press, and when the strain comes on the hoop by the relaxation of the press, the greater the strain the greater is the action of the friction-bars in holding the loops from slipping.

In addition to showing a buckle with four solid bars, the patent shows the fourth bar with a slot or slit cut through it crosswise of its length, but at an angle and a

little to one side of the center of its length, and with the adjacent slot in the plate made longer than the other two slots, so as to enable the hoop to be put under the fourth bar, when put under it the second time, by slipping it through the slit and so under the fourth bar, and to be so arranged as to bear with its upper side against the under side of such bar, on each side of the slit. This dispenses with the necessity of putting the end of the hoop the second time under the fourth bar and drawing the hoop through to its proper position, and enables the operation of completing the fastening to be effected more quickly. By the use of the slit the slack in the hoop before the press is relaxed can be taken up and held better, as a short bend can be made at once, to make the loop around the second bar, without leaving such loop to be made by drawing the hoop through under the fourth bar.

The patent has three claims:

1. The friction clasp or buckle for attaching the ends of iron ties or hoops for fastening cotton-bales and other packages, so that the ties are prevented slipping by the friction against a certain portion of the buckle.
2. The looping of the ends of iron ties or hoops for bales into a buckle, by the form of which they are prevented slipping by friction when the strain of the expansion of the bale comes on the ties, the ends of the hoops or ties not being attached together in any way, the connection being formed by a distinct buckle or friction-clasp.
3. The herein-described slot, cut through one bar of clasp, which enables the end of the tie or hoop to be slipped sidewise underneath the bar in clasp, so as to effect the fastening with greater rapidity than by passing the end of the tie through endwise.

The application for Cook's patent was filed in October, 1857.

Advantages in compressing cotton and other articles tightly in bales are in greater facility of handling equal weights, occupation of less room in transportation, and diminution of liability to loss by burning or wetting. Advantages in using iron ties over rope ties are in cheapness, durability, strength, resistance to the expansive force of the bale, and less liability in the tie to be severed by cutting or burning. Iron ties for compressed bales have come to supersede all others, since efficient modes have been devised of securing the ends of the iron ties. At first such ends were fastened together by riveting. This was too slow a process. On the 17th of June, 1856, David McComb obtained a patent in the United States for an "improvement in non-elastic bands for bales of cotton and other fibrous materials." He cut the hoop of the proper length, and then formed each end of it into a hook and hooked the two hooks into each other, the end of each hook fitting closely into the bend of the other hook, the piece bent over to form each hook being about as long as the width of the hoop. Over these hooks, when put together, he placed a flat link or slide, which secured the hooks from opening when the pressure of the bale was applied on the removal of the compressing power.

In September, 1856, Charles Swett applied, in the United States, for a patent for an "improvement on cotton-bale ties." Swett's application was twice rejected, was then rejected again, on appeal, by the Commissioner of Patents, in April, 1857, and afterward, in October, 1866, on appeal to the Chief Justice of the Supreme Court of the District of Columbia, a patent was ordered to issue. It was issued October 23, 1866, to Charles G. Johnson as assignee of Swett, and antedated to April 23, 1866. The invention of Swett consisted in so securing the metallic bands on the bales that the elasticity of the cotton becomes an active means of fastening the band. Swett employs a metal plate, in which are two slots parallel with each other across the plate, the length of the slots being equal to the width of the band. From the lower and inner edges of the slots projections extend out obliquely beneath the slots, nearly covering their lower openings. One end of the band is passed through one slot and bent back against and under the band. The band is then passed around the bale while under pressure, and its other end is put through the other slot and drawn tight, lapping beyond the first slot, so as to lie up against the first end of the band out to its end. When the blade is relieved from pressure the cotton, by its elasticity, presses the ends of the band so firmly that they cannot be withdrawn from under the body of the band.

On the 24th of September, 1858, George Brodie applied, in the United States, for a patent for an "improvement in metallic bands for baling." The patent was granted to him March 22, 1859. The general idea of this patent is to bend the ends of the hoop and insert within the bend a metallic pin longer than the width of the hoop, and have a connecting-link to join the two ends of the hoop. Figure 6 of his drawings show a connecting-link made by bending metallic wire into such shape that the opening in the middle of the link is wider than at its ends, the ends of the wire which form the link meeting at or near one end of the link, where, as the specification says, its ends may be joined and fastened together, or it may be used without any such fastening. Figure 13 shows how the connecting-link in figure 6 may be used without any pin in the bend of the hoop, by slipping the ends of the link into the bent ends of the hoop. In the course of Brodie's application the Patent Office, in a letter to him, suggested that Cook's patent showed "the plate or link split, for more readily slipping in the end of the band."

On the 19th of September, 1859, Rollin M. Taylor applied, in the United States, for a patent for an "improvement in iron ties for cotton-bales." He had a link or buckle of metal with a rectangular hole cut in its center to receive the loops of the hoop, and an inclined slit or slot cut in one of its sides, the slit being adapted to the thickness of the iron used for the hoop. The ends of the hoop were bent over so as to form loops. The buckle could open laterally at the slit, to facilitate the hooking or locking of the loops. The bent ends of the hoop were to be hooked over the two sides of the frame that were next to the side in which the slit was, and the bent ends of the hoop were to be placed next to the bale. Taylor's claim, as applied for, was the use of the buckle, formed with a slit and opened laterally, in combination with loops, to form the tie. Taylor's application was rejected in September, 1859, on the strength of figures Nos. 6 and 13 in the drawings of Brodie's patent, and was withdrawn in December, 1860. Taylor's invention, as applied for, had been assigned to James J. McComb, the husband of the plaintiff. He had unsuccessfully attempted to introduce into use the tie of David McComb, as patented. Taylor's tie attracted his attention. After the application for a patent for that was rejected, James J. McComb modified the Taylor tie into the "arrow tie," hereafter mentioned.

On the 19th of November, 1859, John T. Butler obtained, in the United States, a patent for an "improvement in fastening metal hoops on cotton-bales." His

device is a plate of metal with a rectangular hole cut in it, and no slit in its frame, with hooks formed of the ends of the hoop and hooked around opposite sides of the plate, so that the ends will lie against the bale and be held in place by the pressure of the bale against them. His claim is to such combination, and is, in fact, like Taylor's, except as to the slit in the frame.

On the 29th of January, 1861, James J. McComb obtained, in the United States, a patent for an "improvement in iron ties for cotton-bales." He takes a plate of metal with a five-sided hole in it, whose two longest sides are opposite each other, and equal and parallel, and equal in length to the width of the hoop to be used. From one of such longest sides, through the frame to the outside, a slit or slot is cut, one side of which is turned outward a little to facilitate the insertion of the end of the hoop. The hole is lengthened in the shape of an arrow, or in the form of two sides of an equilateral triangle, from the ends of its two longest sides, so that the point of the arrow and the side opposite to it are about equidistant from the outside of the frame. The slit is nearer to the side opposite the point of the arrow than it is to the place where the arrow shape commences. One hook of the hoop covers the slot, and the other is hooked around the opposite side. The claim is to the arrow-shaped hole. The specification says that the design of the arrow-shaped end is, not only to force the hoop over the slot, which it does with certainty when the bale expands after being released from the press, but also to secure an equal bearing on the separate parts of the slit side. James J. McComb put this "arrow-tie" into the market, and being threatened by Cook with a suit for infringing the third claim of his patent, in respect of the slit, a purchase of Cook's patent was made and it was assigned to the plaintiff. Since the close of the war, in 1865, James J. McComb has kept the market at the South fully supplied with the "arrow-tie," constructed under his own and Cook's patents, and being what is called an "open-slot" tie. Open-slot ties made by other persons began to appear in 1869.

In March, 1872, a suit at law, brought by the plaintiff and her husband in the Circuit Court for the District of Louisiana, against George Brodie, for an infringement of the third claim of the Cook patent by making and selling an open-slot tie, was tried before a jury. There was a verdict and a judgment for the plaintiffs. In the same month provisional injunctions were granted by the same court in six suits, founded on the Cook patent, against six different forms of the open-slot tie—the Gooch tie, the Wallis tie, the Alligator tie, the Dunn tie, the tie proceeded against in the suit at law against Brodie, and the tie known as the Beard tie, which is the one involved in the present suit. The suit at law and these suits in equity were before Judge Woods, the Circuit Judge. The extension of the Cook patent was opposed by the proprietors of the Beard tie and of the Alligator tie, and others.

The control of the use of the open-slot tie is very valuable, pecuniarily, as that tie has practically superseded the closed-slot tie. Hence the zeal and ability with which this suit has been prosecuted and defended, and the importance of the questions involved to the parties and to the public.

The Beard tie, (known also as the "Eureka tie,") which is the one sold by the defendant, is described in a patent granted in the United States to George N. Beard, December 27, 1870, for an "improvement in cotton-bale ties." It is a plate with a rectangular, oblong, central hole in it, the two long sides of the hole being intended to receive and lie in the bends of the hooks formed by bending the ends of the hoop. The edges of such two long sides, instead of being straight lines, are slightly convex from end to end. The plate outside of the hole is made thicker and wider on one of the two sides which do not receive the hooks than on the other side, and through the latter a slit or slot is cut from the outside into the central hole, to admit of the slipping of the bend of the hook through the slit into the central hole. The lips of the slit are turned down so as to bite into the bale. The tie is sold with one hook set in place. The other is readily slipped into its place through the slit. The ends of the hoop lie next to the bale. The tie is an effective one. It differs but little from the Taylor tie. As in that tie, there is no hook in the Beard tie pulling against the side in which the slit is cut, which is a feature of the "arrow tie." The Swett tie and the Butler tie had closed slots and no slit.

It cannot be doubted that the form of tie with the slit so arranged that all there is to be done, of manipulation, to make the connection of the second end of the hoop with the tie-plate, after the hoop is brought around the bale, is to slip the hook, made by bending down the second end, through the slit and into its place of bearing, is a great improvement over the complicated form of tie devised by Cook, and which, as the evidence shows, has gone wholly out of use. Nevertheless, it is claimed that the Beard tie, in common with all the other slit or open-slot ties, by reason of the use of the slit to slip the bend of the hook in the hoop over the arm, embodies the invention claimed in the third claim of the Cook patent. A determination of this question involves the construction and meaning of such third claim.

It is urged for the defense that what Cook does is to cut a slit or slot in the loop of a buckle, so as to slip the hoop through the slit sidewise and flatwise, instead of pushing the end under an unslit loop endwise, and then pulling the hoop through till it becomes flat; that in the Beard tie the slot is in one of the walls of the quadrangle which forms the clasp itself, of which arrangement Cook gives no hint; that Beard uses such slot to dispense with passing the end of the hoop through a buckle, of which arrangement Cook gives no suggestion; and that Cook must pass both ends of the hoop through his buckle, and then uses the slit to get the projecting bit of hoop under the loop, which is not the buckle or clasp, but merely an appurtenance to it. It is true that the Beard tie has no such loop as Cook has, and no slit in any such loop, and uses a quadrangle with a slit through one of its walls as a clasp. But these points of difference are by no means decisive of the question. Cook, in his third claim, speaks of slipping the end of the hoop sidewise underneath the bar, in contradistinction to passing such end through endwise. When there is no slit the end of the hoop is passed through, under the bar, endwise; but when there is a slit such end is slipped sidewise underneath the bar. The use of the slit enables the part of the hoop which is required to lie against the bar to receive

the pressure of the bar above it from the pressure of the bale below, to reach its proper place by being slipped through the slit, instead of reaching such place by following the drawing or pushing of the part of the hoop intervening to the end through underneath such bar. It is necessary for Cook to put the hoop in such place. If he did not, the strain of the compressed cotton would be likely to pull the hoop so as to destroy the loop around the second bar, and ultimately pull the second end of the hoop entirely out of the buckle. Therefore, the bar through which Cook cuts the slit, to enable the otherwise free portion near the second end of the hoop to reach its proper place, is a part of the clasp or buckle, as much so as any other necessary part of it. Cook completes his tie of hoop and clasp more readily and quickly by the slipping operation through the slit. It is true, he has previously done something toward securing the hoop to the buckle after bringing the hoop around the bale, but what he has done is ineffective, unless the fourth bar is made to surmount the otherwise free part of the hoop. He therefore invented and has claimed cutting the slit or slot through such bar, (which covers the cutting it through an equivalent bar or part of the clasp,) so as to enable the part of the hoop which is to rest under a bar of the clasp to be slipped sidewise through the slit or slot, and avoid putting the end of the hoop endwise through beneath such last-named bar. There is no connection between this claim and what is previously done with any other part of the hoop or any other part of the clasp. The claim is distinctly to the use of the slit or slot so cut to effect the result indicated, for the object indicated. It would make no difference in Cook's arrangement if, instead of lengthening the open space adjacent to his fourth bar and cutting a slit in such fourth bar, he had left such open space as it was and not slit the fourth bar, but made a slit through to the outside from one end of such open space. Such arrangement would have embodied his invention, and its use now would infringe his third claim, because it would effect the result indicated, for the object indicated, by substantially the same means and mode of operation.

With this view of Cook's invention and third claim, it is very clear that it is infringed by the Beard tie. Beard, by using his slit, enables the part of the hoop which is required to lie against the bar, to receive the pressure of the bar above it from the pressure of the bale below, to reach its proper place by being slipped through the slit. But for that, it would have to reach such place by being brought over the top of the bar and through the open central space, all the while following the drawing or pushing of the part of the hoop intervening to the end, through underneath such bar. Beard must put the hoop in such place. If he did not, he would have no loop around such bar, and no tie. Such bar is a part of his clasp, and the bar through which his slit is cut is a part of his clasp; and it makes no difference, in the essential use of Cook's invention, that the bend of the hoop in the Beard tie does not embrace the side in which the slit is cut. Nor does it make any difference that, in the Beard tie, the part of the hoop which is slipped under the arm is nearer to the bend of the loop than is the part which is slipped under the bar in the Cook tie; nor any difference that, in the Beard tie, the bend of the loop is slipped through the slit. The part to be necessarily put in place is put in place by the same means.

In the drawings of the English patent granted to George Hall, November 28, 1801, for an invention of "elastic fastenings for the shoes, and also for bands, garters or ornaments for the knees, waist, arms, neck, and head," there is an open slit or slot in the body of a quadrangular buckle, with four walls, to enable the bend of a loop to be passed through the open slot into the space within, so as to make the loop embrace the walls adjacent to the open slot. But, rising from within and pointing in the same direction as the entrance through the slit, and close to the gateway, on each side, is a sharp spike. On these two spikes the elastic fabric is to be impaled, and only through them is it to reach and embrace the walls on each side of the gateway. The apparatus was not to be used with a metallic band or hoop, nor with a rigid band, but with elastic bandages or strings. The spikes are made, by the specification and drawings, an indispensable accompaniment of the open slot. It is impossible to say, with truth, that Hall's arrangement would suggest or contain either Cook's arrangement or Beard's. Notwithstanding the open slot of Hall, the application of the principle of looping over a hook or slipping under a bar, by means of an opening beyond the end of the hook or of the bar, or in the bar, to making a cotton tie to be used with rigid metallic hoops, required experiment and involved the exercise of invention.

As to the English provisional specification of Frederic James Pilliner, dated July 7, 1856, for "improvements in clasps or fastenings for waistbands, and other descriptions of bands or straps," the counsel for the defendant conceded, on the hearing, that Pilliner's clasp had no open slot.

The link testified to by M. W. Smith, as used in New Orleans, as early as 1848, to connect the hames on a harness-collar with the trace-chains, and enable the two to be rapidly united, the link being stationary on the hames, and the trace being slipped sidewise, in loop, into the link, is an elongated split ring, wholly unadapted to make a cotton-bale tie, and not suggestive of Cook's arrangement or of Beard's.

Being satisfied of the clear right of the plaintiff in the premises, I must decree to her an account of profits and damages in respect to the third claim of the Cook patent. As the present suit is not on the extended term, and the first term has expired, there can be no injunction in this suit.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,941.—*Railroad-Car Springs.*—Granted to AUGUSTUS B. DAVIS, February 15, 1859; reissued January 6 and March 17, 1863. Hearing January 20, 1873.

22,947.—*Wrenches.*—Granted to DANIEL P. FOSTER, February 15, 1859. Hearing January 20, 1873.

22,990.—*Mop-Heads.*—Granted to LUKE TAYLOR, February 15, 1859; reissued November 19 and 24, 1869, and October 19, 1869. Hearing January 20, 1873.

23,001.—*Elastic Toys.*—Granted to LUCIUS P. FOSTER, February 15, 1859. Hearing January 20, 1873.

23,011.—*Water-Wheels.*—Granted to H. F. BURNHAM, February 22, 1859; reissued September 1, 1863. Hearing February 5, 1873.

23,022.—*Molding Covers for Cook-Stoves.*—Granted to GEORGE W. GARDNER, February 22, 1859. Hearing February 5, 1873.

23,032.—*Steam-Pressure Gages.*—Granted to T. W. LANE, February 22, 1859. Hearing February 5, 1873.

23,033.—*Hose-Couplings.*—Granted to ROBERT B. LAWTON and WILLIAM H. BLISS, February 22, 1859; reissued December 21, 1869. Hearing February 5, 1873.

23,034.—*Fire-Plugs.*—Granted to JOSEPH L. LOWRY, February 22, 1859; reissued August 14, 1860, and July 30, 1872. Hearing February 5, 1873.

23,040.—*Locks.*—Granted to LYMAN F. MUNGER, February 22, 1859; reissued December 12, 1871. Hearing February 5, 1873.

23,060.—*Electro-Magnetic Fire-Alarm Apparatus.*—Granted to MOSES G. FARMER, February 22, 1859. Hearing February 5, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 12, 1873.

23,097.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 19, 1873.

23,105.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 19, 1873.

23,152.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 6, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PETTER, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 19, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMBE, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 26, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859. Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste-Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTER, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,824, 4,825, and 4,826, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,631 and 1,632, February 16, 1864; No. 1,691 being again reissued September 27, 1864, and February 13, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

22,792.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,093.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

EXTENSIONS GRANTED.

22,664.—*Improvement in Holders for Lamps*, granted to CHARLES MORTON, January 18, 1859.

Claim.—1. The mode or means, substantially as hereinbefore specified, of counterbalancing the system of levers or lazy-tongs, or the same and one or more articles suspended from or supported by them, and this whether the counterbalance weight be applied so as to push or pull on the levers of the lazy-tongs, as explained.

2. The method, substantially as described, of steadying the tube or rod *c*, or its equivalent, suspended or extending from the lower termination of the system of crossed levers or lazy-tongs, viz., by the collar or slide *p*, the levers *o o*, and the connections *f g*, applied to the part *c* and the lazy-tongs, and made to operate essentially as hereinbefore specified.

22,668.—*Improvement in Coloring and Curing Tobacco-Stems*, granted to BENJAMIN PAYK, January 18, 1859.

Claim.—Coloring and curing tobacco-stems at one operation by subjecting them to the action of steam, as and for the purposes herein set forth.

22,674.—*Improvement in Trusses-Springs*, granted to JOHN W. RIGGS, January 18, 1859; reissued October 10, 1871, numbered 4,589.

Claim.—As a surgical appliance, a steel spring covered with vulcanized India rubber.

22,681.—*Improvement in Cooking-Stoves*, granted to ELIHA C. STEWART, (executrix of the estate of PHILO P. STEWART, deceased,) January 18, 1859; reissued May 31, 1864, numbered 1,694; reissued July 7, 1868, numbered 3,037; reissued May 18, 1869, numbered 3,452.

Claim.—1. The supplying of a continual current of atmospheric air, heated by the front plate of the fire-box or chamber of combustion, or by the front and end plates thereof, and in a flue, chamber, or space, immediately in front of the same, or in front and at the end of said fire-chamber, and in combination therewith, to the oven of a cooking-stove, in which the oven is in the rear of the fire-chamber, and at the same time extends under the same, so as to connect with the said flue, chamber, or space, and thus and thereby permit the said heated air to enter the said oven, in the manner and for the purposes substantially as herein described and set forth.

2. Also, the flue, space, or intervening chamber F, immediately in front of the fire-box or chamber of combustion, having a fire-grate and ash-pit or chamber combined therewith, or in front and at the end of said fire-chamber, and the whole arranged and suspended in the front and upper corner or part of the oven I, into which space or intermediate chamber atmospheric air is admitted, through apertures *s'*, or any equivalent therefor, and thereof, and which are and shall be in and through the plate or door or doors in the front part of the cooking-stove, and in combination with the oven of such stove, so that the air heated within such intermediate chamber, substantially as herein set forth, may or shall be conducted to and into the oven, for the purposes and by the means substantially as herein described and set forth.

3. Also, the admitting of air to said chamber F, and through it to said oven, constructed and arranged as described, by means of the apertures *x* in the front plate or doors, or by means of the apertures *x''* in the side plate of the stove, or by any equivalent for either or both of said apertures, substantially as and for the purposes herein described and set forth.

4. Also, in a stove constructed with an oven, and with a fire-box or chamber of combustion, having a fire-grate therein, and an ash-pit or chamber below and all combined therewith substantially like the one hereinabove described and set forth, the making of the front plate of the stove to open with a door or doors, K, and the attaching an apron in the front of the stove, so as to receive and contain a kitchen or other suitable roaster, substantially as specified herein, so that the heat radiated by the front plate of the fire-box or combustion-chamber shall be aided by the heat radiated by the oven-plates therein, in the manner and for the purposes substantially as herein described and set forth.

5. Also, the employment and arrangement of the front doors K, provided with apertures *s*, or any equivalent thereof and therefor, therein, in combination with the fire-box or chamber of combustion *c*, by means of which atmospheric air, in a highly-heated condition, is admitted to the oven of a cooking-stove, for the purposes substantially as herein described and set forth.

6. Also, the employment and arrangement, in the front of a cooking-stove, of a door or doors, K, or any equivalent thereof and therefor, so that the same, or a part thereof, shall open in front of the fire-box or chamber of combustion, in combination with the fire-chamber or chamber of combustion, having a fire-grate therein and ash-pit chamber combined therewith, and arranged and suspended in the front part of the oven of a cooking-stove, in the manner and for the purposes substantially as herein described and set forth.

7. Also, the employment and arrangement of a suitable door or doors in the front of a cooking-stove, which shall in part or in whole open into that part or portion of the oven which extends forward and under the fire-box or chamber of combustion, and other parts necessarily employed and used therewith, in the manner and for the purposes substantially as herein described and set forth.

8. Also, the arrangement of a fire-chamber or chamber of combustion with a fire-grate, and an ash-pit or ash-chamber combined therewith, and the whole suspended in the front part and upper corner of oven of a cooking stove, in the manner and for the purpose substantially as herein described and set forth.

9. Also, the employment and arrangement of the additional or extra bottom and encasement *r*, in combination with the flues of the bottom of a cooking-stove, and underneath the oven I, in the manner and for the purposes substantially as herein described and set forth.

10. Also, the employment and arrangement of the additional or extra back and encasement *u*, in combination with the ascending and descending flues in the rear end of a cooking-stove, and between the rear end of the oven and the rear vertical end plate of the stove, in the manner and for the purposes substantially as herein described and set forth.

11. Also, the employment of a corrugated plate, perforated along the front thereof, for the top of the oven I, as arranged in connection with the flue H and fire-chamber or chamber of combustion, and with the rear and vertical plate of the oven of a cooking-stove, substantially as and for the purposes herein described and set forth.

12. Also, the employment and arrangement of the front damper or valve Y, in the front and hearth of a cooking-stove, in combination with the flue or flues, as the case may be, immediately underneath the oven and bottom-plate of the oven of a cooking-stove, having the fuel-chamber and ash-pit arranged as hereinbefore specified, in the manner and for the purposes substantially as herein described and set forth.

13. Also, the employment and arrangement of the boiler or reservoir, having a removable or detached cover or top, and containing two inclined flues or tubes, which are separated at the bottom or lower ends thereof, and which unite at the top or upper ends thereof, and thus and then form but one pipe, in the manner and for the purposes substantially as herein described and set forth.

DISCLAIMER FILED.

33,883.—GEORGE ROSS, Newport, Ky.—*Molding and Casting Apparatus*, dated April 16, 1861.

Disclaims "that part of the claim in the specification which is in the following words, to wit:

'1. The vertical pipe-mold drying-oven herein described, arranged with separate and distinct communications with the molding and casting pits, as and for the purpose specified.'

The ordinals of the remaining claims being changed to first, second, and third, respectively."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 14, 1873.]

6,340.—*Heating-Stove.*—ISAAC J. BAXTER, Peekskill, N. Y.

6,341.—*Show-Card for Head-Nets.*—THOMAS HALL, Jersey City, N. J.

TRADE-MARK REGISTERED DURING THE WEEK.

[Bearing date January 14, 1873.]

1,102.—*Compound of Pyroxyline.*—CELLULOID MANUFACTURING COMPANY, Albany, N. Y.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date January 14, 1873.]

ORIGINAL PATENTS.

134,721.—*Medical Compound for Horses, &c.*—JAMES ANDREWS, Hardin county, Ohio.

Lubricating oil, spirits of turpentine, carbonate of ammonia, gum camphor, gum myrrh, gum guaiacum, cayenne pepper, oil anise, whisky.

Claim.—The combination of the articles enumerated, in the proportions and for the purposes set forth.

134,722.—*Harvester-Rake.*—THOMAS P. BARBOUR, Louisville, Ky., assignor of one-half his right to LEWIS B. BRUEN, (Woodside,) Newark, N. J.

The fingers or rake-teeth, which are secured rigidly to an oscillating axle, are automatically locked and released by a sliding plate, which passes under a projection thereon as said plate comes in contact with cam-projections in its reciprocating movement.

Claim.—The combination of the levers G G, J, and I, fingers F, axle *e*, support *d*, slide *f*, cams K L M, springs N, crank T, and levers *r*, all constructed substantially as described.

134,723.—*Metallic Bottom for Milk-Cans.*—THOMAS M. BELL, New York, N. Y.

The edge of the bottom is turned downward to fit closely within the inner end of the body.

Claim.—The hoop or band B *b*, made of wrought-iron, rolled, with the heavy base or shoulder *b* on the lower inner edge, in combination with the body C and with a bottom, A, formed so that the edge of the bottom fits closely against the interior of the body for a considerable height, as herein specified.

134,724.—*Paper-File.*—GEORGE W. BILLOW, Shelby, Ohio.

Two hooks, whose ends overlap, are hinged in openings at opposite ends of a base-plate, and are held open or closed by springs bearing upon their hinges.

Claim.—The letter or paper file composed of the support A, hooks C, and springs B, substantially as specified.

134,725.—*Axle Box and Spindle.*—JACOB BOWER, La Fayette, Ind.

The pin is withdrawn and the grease poured in at the orifice L, from which it runs into the orifice J, thence through the recess N, and fills the recess H. The collars B C D retain the grease within the box A when in use upon the journal E.

Claim.—1. The box A having the collar C, in combination with the journal E having the lubricating-chamber between the collar C and the shoulder on the spindle adjacent the mouth of the recess N, substantially as shown and described.

2. The combination of the box A provided with the internal collars B C D, in combination with the journal E provided with the recesses F G H and inclined orifice J and recess N, when the box is secured upon the journal by means of the cap K provided with the orifice L, substantially as shown and described.

134,726.—*Sheet for Forming the Bodies of Square or Rectangular Tin Cans.*—JOSIAH BOWERS, Baltimore county, Md., assignor to JOHN A. IVES & BROTHER, same place.

The sheet of tin to be operated upon is first accurately laid upon the under die, its edges at two sides and one end projecting over the bed-surface. The upper die or follower is then brought down, and the notches and flanges are made upon the sheet at one operation.

Claim.—Sheets for forming the bodies of square or rectangular tin cans which are flanged or "broke" and notched at one and the same operation, and by dies operating as and for the purpose described.

134,727.—*Rush-Holder.*—WILLIAM B. BRADFORD, Charlotte, N. C.

A metallic case contains a flanged roller, surrounded by a five or six sided rubber ring, making a polygonal rubber roller. This roller is pivoted in one end of a forked clip, while a set-screw projecting outwardly through the case bears against the opposite end of the clip and regulates the pressure. Near the rear end of the clip is a slot, through which a rivet passes, and in the sides of the frame are other slots in which the pivots play, one end terminating in a knob, so that the polygonal roller can be readily moved from contact with the frame.

Claim.—The slotted frame A for the outside of the sash-frame, having polygonal rubber roller B G pivoted in the slotted clip *c*, and set-screw D, when all are combined to operate substantially as shown and described.

134,728.—*Cultivator.*—SEAMON S. BUSHNELL, Horicon, Wis.

Claim.—Beam A, tooth B, and standard C, in combination with set-screw G, substantially as described.

134,729.—*Gage.*—JOHN W. BUTLER, New Britain, Conn.

The slide is secured at any desired point upon the bar by a wedge inclosed within a cavity of the slide, and which is caused to jam the slide by giving the latter a partial rotation in either direction.

Claim.—The combination of the bar, the slide, and the wedge, or its equivalent, lying in a circular enlargement larger than and eccentric to the bar, constructed, arranged, and designed to operate substantially as described, for the purpose set forth.

134,730.—*Means for Propelling Vessels.*—HENRY C. CAMP, St. Paul, Minn.

The inertia of the body of water contained in the reciprocating-tube is utilized as the fulcrum against which the vibrating gates operate to propel the vessel.

Claim.—1. The combination of the reciprocating tube B gates J, and ways D with a motive power, substantially as and for the purpose specified.

2. The combination of the gates J, frames K, and tube B, substantially as specified, whereby either gate may be raised to change direction, as required.

134,731.—*Water-Wheel.*—JOEL J. CASE, Terryville, assignor to NATIONAL WATER-WHEEL COMPANY, Bristol, Conn.

An annular series of gates, their bases in line, but their open spaces of different altitudes, so that when the gate descends the chutes are closed in succession, the water being thus cut off in a graduated manner, and let on in like manner.

Claim.—The series, two or more, of graduated openings 1 2 3 4, formed in the vertically-sliding hoop-gate B, in combination with the ordinary chute-case A, substantially as and for the purpose set forth.

134,732.—*Cultivator.*—ISAAC N. CAUTHORN, Carthage, Ill.

The two beams are attached at their forward ends to an arched bar (by which the device is drawn) so that the beams, with standards and shovels attached, are held in an upright position, at the same time having a free independent vertical and lateral movement.

Claim.—The plow or cultivator beams E E' attached directly to part A, which acts as the double-tree or evener, by hinge-joints arranged to give separate free lateral or lateral and vertical motion to each beam for its plows or cultivators and hold them upright in use, substantially as set forth.

134,733.—*Foot-Rest for Chairs.*—EDWARD COLLINS, New York, N. Y.

A foot-rest, to be attached to a chair, is made in two parts, sliding one within the other, and is adjusted as to length by means of a lever and a ball working in a tapering chamber and by means of an apron extending from the lower portion to the upper portion of the frame-work and passing round a roller; and the foot-rest is adjusted to different angles of inclination by a notched bar pivoted to the frame.

Claim.—1. A foot-rest for chairs, &c., made in two parts, sliding one within the other by means of tubes and rods, and held at different lengths by means of an apron secured to one of the parts and passing over a roller on the other part, substantially as shown and described.

2. The combination and arrangement of the chamber H, ball J, lever K, and strip L, as shown and described, for the purpose specified.

3. The combination and arrangement of the notched bar P, pivoted to the frame D by means of rod R and eyes *d*, the bar S, and cord *p*, as shown and described, for the purpose specified.

134,734.—*Earth-Auger.*—GEORGE G. COLLINS and JAMES A. MORRISON, Philo, Ill., assignors of one-third of their right to OLIVER WOOD, same place.

The air-passage is for the purpose of enabling the metallic boring-cylinder to be withdrawn without lifting the atmosphere. The loops C embrace ears formed upon the auger-bit, and thus afford a ready means for the attachment and detachment of differently-formed bits for the different purposes of excavating earth or quicksand.

Claim.—1. The bit-stock A, composed of the hollow cylinder B provided with the loops C upon its interior opposite sides so as to permit of the insertion of the auger-bits I and O, at pleasure, substantially as shown and described.

2. The bit-stock A, composed of the metallic cylinder B provided with loops C C, air-passage D, and bifurcated brace E, and socket and key-hole F, arranged relatively one to the other, as and for the purposes hereinbefore set forth.

134,735.—*Bracelet.*—THOMAS L. CORNELL, Derby, Conn.

A piece of elastic metal is inserted in the opening between the jaws, and, having enlarged or hooked ends, serves to protect the article from being lost when accidentally unlatched.

Claim.—A blade provided with hooks or stops, in combination with the segments of a bracelet, for the objects and purposes described.

134,736.—*Heel-Stiffener.*—LUTHER C. CROWELL, Boston, Mass., assignor of three-fourths of his right to EDWARD DILLINGHAM and NATHAN DILLINGHAM.

The stiffener is of such configuration that each successive one may be cut without waste of material.

Claim.—The described method of cutting blanks for heel-stiffeners from sheets of metal or other suitable material, without waste of material, of the form shown, having the two projections B B upon one edge and the three projections A A A upon the opposite edge, for the purposes herein shown and described.

134,737.—*Scaffold.*—JOHN F. DARLEY, Nebraska City, Neb.

The short removable legs G are attached by means of eyes *f*, their upper ends being inserted between lugs *g*. The notched brace *t* holds the legs extended. The stepped blocks D are cushioned. The device is convertible at will into either a window-bracket or a trestle.

Claim.—1. The removable legs G and cross-bar J, in combination with the platform-beam A and platform B, substantially as described.

2. The longitudinally and laterally extensible sectional legs S S', pivoted to eyes *f* and brace *t*, in combination with the lugs *g* and platform-beam A, substantially as described.

3. The cushions and stepped blocks D, for the purpose described.

134,738.—*Caster-Stand.*—GEORGE D. DUDLEY, Lowell, Mass., assignor to EDWARD P. WOODS, DAVID SHERWOOD, and CYRUS H. LATHAM, same place.

The stand is made from twisted wire, having upper and lower frames, each having rings and seats for bottles. Legs and handles complete the stand.

Claim.—As a new article of manufacture, a stand for holding bottles made of twisted wire, the said stand having a series of holders, *a*, and a supporting ring or rest, *b*, for the bottle, substantially in the manner described and specified.

134,739.—*Mop Head.*—WILLIAM DUNCAN, Lebanon, N. H.

A mop-handle, to whose foot is rigidly attached a head with slotted ends, through which passes the mop-holding stirrups, above which its ends are contracted to one, which passes through a lug confined to the handle, and is held in an adjustable position by the thumb-screw.

Claim.—The combination, with the handle A and head B, of the stirrup D, lug C, and screw-nut E, constructed and operating substantially in the manner described.

134,740.—*Rotary Fan.*—IRAD S. EASTMAN, Madison, Wis.

The principal and supplementary arms have pivoted connections, and hence a double and triple circular motion within the circle described by the main shaft and its attachments.

Claim.—1. The combination of shaft D', sleeve E, arms F F', constructed as described, with the supplemental arms G G' and horizontal arms H H', carrying the fans, all arranged to operate substantially as and for the purpose described.

2. In combination with the subject-matter of the above claim, the cord J for adjusting the shaft D', substantially as and for the purpose described.

134,741.—*Locomotive Fire-Box.*—CYRUS H. FARLEY, Portland, Me.

Arranges a guard around the bottom of the fire-box to prevent snow, &c., from entering and extinguishing the fires. Combines also with the guard, flues and dampers in the sides of the fire-box for the admission of air above the guard.

Claim.—1. A locomotive fire-box provided with inclined guards *m*, arranged substantially as and for the purpose specified.

2. The combination of the inclined guards *m*, and flues *d*, and dampers *f*, arranged in a locomotive fire-box, substantially as and for the purposes set forth.

134,742.—*Tool for Finishing Axle-Blanks.*—HAMLET E. FORREST, Cambridgeport, Mass., assignor to himself, HORATIO BOOTHBY, Boston, Mass., and JOHN H. LEAVITT, Portland, Me.

A diagonal cutting-edge sloping a little toward the base. The point, cutting first, forms the end of the axle, and is gradually passed under, all the time presenting a cutting-edge, but approaching the shoulder, which is formed by a groove or depression in the cutter.

Claim.—The improved lathe-tool, as described, the same consisting of the plate C, formed with the compound inclination or angular cutting-edge *o* and lateral taper *o'*, and with the collar forming recess *a*, the whole being as and for the purpose set forth.

134,743.—*Railroad Car Truck.*—PERRY G. GARDINER, New York, N. Y.

The truck is composed of two sections. The transoms connect their inner ends, between which is the swinging bolster and sand-board, which extend outside of the body of the truck. This construction admits of the weight being supported very low on the truck and outside of the body, which lessens the surging of the cars when in motion.

Claim.—1. A truck composed of two sections, A A, having extended transoms B B secured to the inner side of each section, and between the same the swinging bolster E, the bolster-springs *o o* connecting the sand-board and bolster being hung outside of the body of the truck, constructed and operating in the manner and for the purposes set forth.

2. In combination with the truck-frame in sections, as above described, the truss-rods *u v* connecting pedestal-straps *n*, the truck or jack-bar V, and bracing or adjusting screw *o''*, arranged and operating substantially in the manner and for the purposes described.

134,744.—*Ruffling Attachment for Sewing-Machines.*—HARRY C. GOODRICH, Chicago, Ill.

The ruffling attachment is adapted to the Wheeler and Wilson machine, and is operated from a pin projecting from the rocking arm. The reciprocating ruffling device is connected with the bell-crank lever by a link which is adjustable on the bell-crank to regulate the fullness of the gather.

Claim.—The combination of the plate B, lever *b b'*, bar C, sliding piece *c c' f*, and the piece *g*, pivoted to the piece *c'* and provided with the pin *f*, substantially as shown and described.

134,745.—*Paint-Brush.*—JAMES J. GORMAN, Cincinnati, Ohio.

The bristles are secured to a stock of leather and both secured to a handle by metallic plates and a screw.

Claim.—1. A brush constructed separate from its stock, as follows, to wit: The bristles C, properly arranged around a core-piece, *c'*, of leather or other suitable material, wrapped by a binding-strip, *c*, and the whole secured by threads sewed through from side to side, substantially as set forth.

2. The combination of a stock, A, provided with a stationary clamp-plate, *B'*, a clamp-screw, *b'*, and a transverse groove, *a*, with a detachable clamp-plate, B, fitted to seat in said groove, and be secured by said screw, for the purpose set forth.

134,746.—*Steam-Pump.*—JOHN W. HANDREN, Jersey City, N. J.

A proper quantity of suitable compressible packing being placed in the recess provided, a large perforated gland is applied over the end of the plunger farthest from the steam-port of the apparatus, and, the cover at that end of the pump being bolted in place, a screw is applied to act on the gland and thereby compress the packing to the proper degree.

Claim.—In pumps, the open-work gland or tube M, with its adjusting-means M' arranged as shown relatively to the packing *m*, in combination with the double-acting plunger *b* and suitable means for reciprocating it, and with the valves G H and suitable connections, as herein specified.

134,747.—*Corn-Planter.*—GEORGE D. HAWORTH, Decatur, Ill.

Claim.—1. The bar K pivoted on the horizontal bars A A and arms H H, in combination with the shoe J, furrow-shares G G, pole L and the seeding part of a corn-planter, substantially as described.

2. The oscillating seat-standard C, pivoted lever D with bent bar *d'* pivoted to the seat-standard and lever, in combination with the furrow-shares G G and the seeding part of a corn-planter, substantially as described.

3. The shaft M, constructed as described, with the sloping shoulders A A, loop P, and slot *p*, in combination with the seed-tube *m'*, seed-slide N, and connecting-bar O, substantially as described.

4. The semi-revolving pulley-holder, substantially as described, and for the purpose set forth.

134,748.—*Shawl-Strap.*—JOHN B. HIGGINS, Boston, Mass.

The stiff curved metallic handle is flanged, and between the flanges is placed a strap.

Claim.—In combination with a curved metallic handle, *a*, provided with side flanges *c c*, the welted strap *d* and covering *e*, attached to the handle in the manner and for the purpose set forth.

134,749.—*Railroad Rail.*—WILLIAM S. HUNTER, Stanstead, Canada.

Should the rail *a* break, the two parts into which it is divided will be securely held in place by the rails *b* and bolts *i*. The rail *b* is attached to the sleepers *a*.

Claim.—The combination of the wooden beams *b* having a recess, as described, the covering-rail *e* provided with a corresponding tongue, and the chair *k* with bolts *i*, the bolts being adapted to pass through the tongue of the covering-rail, as described.

134,750.—*Middlings-Purifier.*—CHARLES JANNEY, Minneapolis, Minn., assignor to CHARLES M. HARDENBERGH, same place.

Lever-arms having knockers and weights adjustable upon slides, all arranged upon a rock-shaft and operated in reverse directions by a cam, are arranged above a shaker for the purpose of clearing the meshes of the bolt.

Claim.—1. The combination of the revolving cam E' on shaft E, hammers *f'* of arm F' on rock-shaft F, with the jar-bars *f'* on reciprocating bolt-frame B, all constructed and arranged in the manner substantially as and for the purpose described.

2. The combination of the slide-bar G, adjustable weights G' with the rock-shaft F and hammers *f'*, when constructed and arranged to operate in the manner substantially as described.

134,751.—*Bracket for Flower-Pots.*—MELVILLE D. JONES, Boston, Mass.

To the bracket-arm a saddle is fitted and provided with sockets for holding branch or auxiliary arms, and the saddle-arms are combined with the bracket, swinging bracket-arm, and a shelf or plate attached to the end of the bracket-arm.

Claim.—1. The combination, with the bracket-base and arm hinged thereto, of a saddle fitted to said arm and provided with sockets or their equivalents for holding branch or auxiliary arms, substantially as shown and described.

2. A compound bracket, consisting of base A, hinged arm D, saddle E, and swinging arms *d*, the said arms D *d* being provided with or adapted to receive shelves or plates *e* F, and the whole being constructed and arranged substantially as described.

134,752.—*Lounge.*—FREDRIC KRATER, Pittsburg, Pa.

The detachable frame is provided with pendants on its front that serve as legs when used as a bed, and as steps when folded for use as a sofa; the back of said frame is provided with pins that enter corresponding holes in the front of the main frame when the device is used as a bed, and support the back of the detachable frame.

Claim.—The detachable frame *c* provided with pendants *e* and pins *h*, used in combination with the base of the sofa, as herein before described, and for the purposes set forth.

134,753.—*Machine for Bundling Shingles.*—ROBERT LAW, Toledo, Ohio.

The shingles are first placed in a box and then compressed by a peculiarly-constructed press mounted upon wheels, which is also used for removing the shingles after the bundling is completed.

Claim.—1. A packing-box for binding shingles, having a bottom slotted both laterally and longitudinally and a removable side for the passage of the clamping and transporting mechanism, substantially as set forth.

2. A clamping-carriage for clamping and transporting shingles, operating substantially as set forth.

3. The combination of the clamping-jaws and compressing mechanism, substantially as set forth.

134,754.—*Reed-Organ.*—RAPHAEL E. LETTON, Quincy, Ill.

The sounding board and chamber are in the rear portion of the wind chest, and in close contact with the channels leading from the reed.

Claim.—The combination of the conductor C and sounding-chamber X, arranged and constructed substantially as shown and described.

134,755.—*Tag-Fastening.*—JOHN S. LOUGHERY, New York, N. Y.

The fastening-wire is coiled into a spiral so as to be distended to envelop a large package.

Claim.—1. A tag-fastening wire having a liberal length of wire formed in a free coil, B, ready for extension when required, as herein specified.

2. The tag-fastening wire described, having the free coil B, eye B^1, and extended portion B^2, in combination with the attached tag A, and adapted to serve on articles of different sizes, as herein specified.

134,756.—*Tag-Fastener.*—THOMAS P. MARSTON, New York, N. Y., assignor to JOHN S. LOUGHERY, same place.

On substances difficult to penetrate the fastener holds the tag sufficiently tight.

Claim.—The within-described tag-fastener, formed without a hook, having the two equal arms A^2, with their joining-spring A^1, inward bends A^4, and mid-length bends A^3, operating in combination with the slip-ring B, as and for the purposes herein specified.

134,757.—*Tag.*—THOMAS P. MARSTON, New York, N. Y., assignor to JOHN S. LOUGHERY, same place.

The fastening-eye is composed of gutta-percha, molded in place.

Claim.—The within-described tag, having the double button $B B^1 B^2$ molded in place in and around the hole in the sheet A, and adhering to both faces of the latter, as herein specified.

134,758.—*Whiffletree.*—CHARLES B. MCCLYMOND, Elderton, Pa.

Claim.—Whiffletree-irons consisting of two straps, B, the outer ends of which clasp the hood D forward of the shoulder or collar *c* clamped and held together by the ferrule *c*, the whole constructed and arranged upon the whiffletree A, substantially as herein described, and for the purpose set forth.

134,759.—*Sewing-Machine Table.*—JOHN B. MCLURE, Wheeling, W. Va.

To the top of the table a box or cover is hinged. The several parts of the box are hinged together, and the top and bottom are joined by L-shaped hinges. When opened, it completely covers the machinery. When not used for a cover it folds compactly together into a recess and forms a part of the table-top.

Claim.—1. A sewing-machine table, A, with a box or cover, B, all the parts composing which box fold compactly together, as described, upon the top of the table or within a recess made within it, as described.

2. The box or cover B, folding together as described, in combination with the L-shaped hinge.

134,760.—*Jig-Saw.*—BENJAMIN MERRITT, Newton, Mass.

The saw-frame is balanced by weights attached to cranks and sliding upon guides.

Claim.—The arms *n n'*, provided with weights *p p'* operating up and down on standards *r r'* and weighted caps *o o'*, so as to counterbalance the weight of a gate, *l*, and double cranks *i i'*, connected with arms *k k'* of a jig-saw, substantially as specified.

134,761.—*Fastening for Shoes, &c.*—GEORGE MERRILL, East Orange, N. J.

A bar is attached to the flap to be buttoned over, which bar, extending back, engages in an eye. The flap is subsequently secured down. The object of the bar is to create a leverage in drawing the parts together.

Claim.—1. A fastening for shoes, garments, &c., consisting of a bar having one of its ends attached to one edge of the object and its opposite end left free to engage in the other edge of the same, in combination with a suitable device for fastening the free end down, when constructed and arranged substantially as shown and described.

2. The bar A, with the swiveled locking-arm E, in combination with the bar B, when constructed and arranged to operate substantially as set forth.

134,762.—*Medical Compound.*—THOMAS MORLEY, Cambridge, Mass.

Cream of tartar and rhubarb mixed in a dry powder or with water, for the cure of small-pox and fever.

Claim.—A compound, whether in the form of powder or liquid, composed of the ingredients aforesaid, and substantially in the proportions and for the purposes set forth.

134,763.—*Device for Fastening the Ends of Shoe-Binding Strips.*—CHARLES E. MORRILL, Dearing, Me.

The hammer, which is intended to press the pasted ends of the shoe-binding, is arranged on a table and operated by a treadle.

Claim.—The arrangement, upon the table A and base B, of the treadle *j*, spring *f*, arm *i*, spring *n*, guide *m*, lip *g*, shoulder A, and hammer *d*, as herein set forth, and for the purpose described.

134,764.—*Match-Box.*—OSCAR PADDOCK, Watertown, N. Y.

The receptacle for stamps, &c., is so made and placed that its contents cannot be taken by mistake for matches.

Claim.—A match-safe made substantially as herein shown and described—that is to say, comprising a live-match receptacle and a dead-match holder, the latter, whether removable or stationary, being constructed of a depth considerably greater than the length of the burned match-sticks which it receives, and of such contracted sectional area in proportion to its depth as to practically remove the burned sticks beyond reach of the fingers, as set forth.

134,765.—*Hot-Water Heating Apparatus for Ranges.*—HENRY L. PALMER, New York, N. Y.

Claim.—1. The water-back B, reservoir *d*, radiator *m*, and connecting-pipes *b b' c c'* combined and arranged substantially as herein set forth, so that the said water-back will act as a circulating as well as a heating medium.

2. The combination of the reservoir *d*, the radiator *m* placed within a chamber adjacent to the range, the water-back or heating-coil B interposed between the said reservoir and radiator, the connecting-pipes *b b' c c'* permitting a constant circulation of water through the water-back, between the reservoir and radiator, the pipe *p* for supplying cold air to the chamber *n*, and the pipe *o* for conducting heated air from the said chamber to apartments to be warmed, all substantially as herein set forth.

3. The combination of the water-boiler *d*, casing *e*, and air-conducting pipes *p o*, arranged substantially as described, to provide for employing the water-boiler *d* for heating purposes.

134,766.—*Mechanical Movement.*—WEBSTER PARK, Norwich, Conn.

A series of cylinders upon a shaft, each provided with pins on one side, figures on the periphery, and an eccentric, having arms on the other side or face, which engages pins on the adjacent cylinder and communicates the force applied to the first cylinder tenfold to the next, and so on.

Claim.—1. The combination of the eccentric D, arms I I, and pins or teeth C C, substantially as described.

2. The cylinder A having the pins or teeth upon one end and the eccentric upon the other, all cast in one piece of metal, substantially as set forth.

3. The combination and arrangement of a series of cylinders, A, each having an eccentric, D, pins or teeth C C, and non-revolving arms I I, all arranged upon one shaft, B, and operating substantially as herein described.

134,767.—*Base-Burning Fire-Place Heater.*—JOHN S. PERRY, Albany, N. Y.

Claim.—1. The annular chamber G and jacket A, in combination with the partition *p*, the flues *s s'*, the openings *n m*, and the damper *n*^{3}, all being applied in a fire-place stove substantially as described.

2. The hollow heat-radiating base chamber G and the jacket A combined in a fire-place stove, substantially as described.

134,768.—*Machine for Pressing Cigar-Bunches.*—GEORGE PIERCE, Boston, Mass.

The bunched cigar is pressed into form before receiving the wrapper, in a sectional die, both sections being movable in the same plane of motion, the lower following the upper at an interval in its rise, both within a frame out of which the bunch is thrown by the lower die, the upper die cushioned by a spring above.

Claim.—1. The pressing device, consisting of guard K and the two movable dies M and G, arranged and operating together substantially as and for the purpose described.

2. In a cigar-machine, the combination, substantially as and for the purpose described, of the following elements, viz: A pair of dies, M and G, a spring, H, adjustable in its pressure, interposed between the actuating mechanism and one of the dies, a reciprocating actuating mechanism, C, to move the dies to and from each other, adjusting-nut I to regulate the pressure of spring H, and a guiding device applied between the die G and reciprocating mechanism C to secure a reciprocation of said die in the same plane independent of the action of the spring H.

134,769.—*Washing-Machine.*—EDWARD POTTS, Philadelphia, Pa.

In a tub with vertical ribs a drum is arranged to rotate horizontally and eccentrically. Also, a bell-shaped roller and a curved device for turning the clothing.

Claim.—1. The combination of an inclosing-vessel with a pressure-roller or drum, arranged eccentrically to the axis of said vessel, for producing an intermittent progressively-continuous pressure on the clothing or other objects to be washed, as shown and described.

2. The bell-shaped roller *h* and follower *k*, for upsetting or turning the objects to be washed, constructed substantially as described.

3. The combination of vessel *a*, drum *b* arranged eccentrically, bell-shaped roller *h*, and follower *k*, all constructed substantially as set forth, for the purpose specified.

134,770.—*Reaction-Pump.*—ELIAS RHODES, Jr., Clyde, Ohio.

The piston-rod is operated by a lever, which is attached to the upper end of the rod and pivoted to the pump-stock, and to another lever which forms the handle, and which is also pivoted to the pump-stock. In the pump-stock is one valve, which opens and closes alternately with the movement of the lever.

Claim.—1. The single valve J, arranged to alternately close the opening in the upper end of the pump stock and the water-passage, in combination with the cylinder A, substantially as and for the purpose herein described.

2. The lever H, pivoted at *i* to the pump-stock, and at *k* to the lever I, which is also pivoted to the pump-stock, to form a simple or compound lever, substantially as and for the purpose specified.

134,771.—*Spindle for Spinning-Machines.*—DAVID HALL RICE, Lowell, Mass.

The live-spindle, when in rapid motion, is mainly supported and revolves upon the column of oil raised on the spiral surrounding the dead-spindle.

Claim.—The dead-spindle B, provided with the spiral *c*, in combination with the live-spindle A, having its chamber for the dead-spindle closed at the upper end over the latter, substantially as described.

134,772.—*Gun-Sight.*—HERRMAN A. SCHOTTKY and THEODORE SIMENDINGER, Hartford, Conn.

Claim.—1. In a gun-sight, the combination, with a ring, B, provided with a socket, C, of the sight H, adapted to be raised and lowered by a shank, F, substantially as described.

2. In combination with the foregoing, the index J and graduated scale D, substantially as and for the purpose set forth.

134,773.—*Slate-Dressing Machine.*—FRANCIS SHERTON, Slatington, Pa., assignor to "THE LOCKE SLATE COMPANY," Philadelphia, Pa.

Claim.—1. In combination with a knife balanced on a rock-shaft, as described, the spring-stop V to arrest and limit the motion of the knife and treadle.

2. In combination with the balanced knife, rock-shafts, and treadle, the platform fastened to the sills, and the seat upon it for the operator.

134,774.—*Steam and Air Brake.*—ALEXANDER Q. SMITH and HENRY M. OGDEN, Burlington, Iowa, assignors to themselves and DAN. BROWN, same place.

Valves of different sizes are arranged in a case which is connected to the brake-pipes. The valves are pivoted to a lever with arms of different lengths to compensate for the difference of pressure on the different-sized valves.

Claim.—The valves C D, attached, respectively, to the arms of a lever, *l*, the said valves and lever being constructed and applied to operate substantially as and for the purpose set forth.

134,775.—*Transplanter.*—JAMES P. STANTON and ROBERT C. PEDRICK, Pedricktown, N. J.

There are two openers and two pressers. The plant is dropped into a funnel with root downward, and by a movement of the hand the plant is set.

Claim.—1. The vertically-moving bar B, and its attached funnel, combined with the converging slotted swinging bars 2 3, substantially as and for the purpose described.

2. The slotted converging swinging bars 2 3, in combination with the funnel and with compressing flaps and the devices by which such flaps are operated.

3. The described construction and arrangement, as a whole, whereby the movement of the slide-bar B in one direction causes the shovels to approach while the compressers recede from each other, and the movement of the same bar in the opposite direction causes the shovels to recede while the compressers approach each other.

134,776.—*Repeater for Duplex Telegraphs.*—JOSEPH B. STEARNS, Boston, Mass.

Pulsations from line east cause armature of A to close local circuit through B', which closes main circuit to line west; A' in that circuit, being a "duplex magnet," is unaffected thereby. Pulsations from line west operate A', B, and line east similarly. A or A' is affected only by a current from its line side.

Claim.—The arrangement, in a duplex repeater, of the electro-magnets A A' B B', and their corresponding circuits, as and for the purpose set forth.

134,777.—*Screw-Cutting Die.*—WILLIAM E. WARD, Port Chester, N. Y.

Through the cutter-head is a central hole for the passage of the rod to and between the dies, which latter are situated upon the face of the cutter-head at an angle to the central hole. The dies are grooved throughout on one side, which at the inner ends form thread-cutters, and they can be adjusted and held by grooved wedges. Recesses in the rear of the cutting corners receive the chips as the device is rotated to cut the threads.

Claim.—The chuck, with its central hole and gullets and tangent-channels, in combination with the dies and adjusting-plates, grooved and secured substantially as and for the purpose described.

134,778.—*Band-Pulley.*—ELLIOTT PENDLETON WEST, Jersey City, N. J.

A pulley having one edge of the groove made perpendicular and the other slanting, so that as soon as the motion is reversed the cord twists upon itself so as to act as a brake.

Claim.—A pulley grooved substantially as described, on which a belt will operate in the manner explained.

134,779.—*Scythe.*—EDGAR L. WHEELER, Scytheville, N. H.

The blade has two points, and instead of the usual tang and wart for attachment being on the blade, they are a part of a detachable clamp, the jaws of which are attached to the desired point of the back of the blade.

Claim.—As a new and improved article of manufacture, a double-pointed scythe-blade made without a tang and capable of use substantially in the manner described and specified.

134,780.—*Mechanism for Operating Sewing-Machines.*—DANIEL WHITLOCK, Newark, N. J.

By depressing the sandal at the heel the brake-shoe is thrown in contact with the wheel. By the reverse depression of the sandal the wheel and live pulley are connected together, which sets the machine in motion, and by only a partial depression of the sandal in front the speed of the machine can be regulated.

Claim.—1. The combination for simultaneously throwing a frictional surface out of contact with a live and movable surface and forcing the pressure of a brake upon a wheel on a secondary shaft and thereby stop the motion of said wheel or vary it, in the manner and for the purpose substantially as described.

2. The combination of the treadle C, connecting-rod C', bar D having arms or projection *d*, sliding pin *f* in shaft F, key *f'*, wheel B', spring *g*, and friction surface *i* with the live pulley *b'*, substantially in the manner and for the purpose described.

3. The combination of the treadle C, connecting-rod C', arm D having projecting arm *d'*, connecting-rod *s* having gage-nuts *s'* and *s''*, and pivoted arm *e''* terminating in brake E with the wheel B; on shaft F, in the manner and for the purpose substantially as described.

134,781.—*Nut-Lock.*—AARON WILLIAMS, Burrell, Pa.

The nut, made with one side longer than the other, has a slot or groove through the threads in the short side. In consequence of its greater weight the long side drops to the lowest point, and the edges of the groove impinge against the threads of the bolt.

Claim.—The nut A, the contour of which is a parallelogram in form, with the opening B for the bolt eccentric to the nut, and provided with the recess C, substantially as herein described, and for the purpose set forth.

134,782.—*Furnaces for Roasting and Treating Ores.*—ZABDIEL A. WILLARD, Boston, Mass.

Claim.—1. The combination of the delivery-orifice, by which the gaseous fuel is introduced, with the primary chamber in which the gases are mixed and prepared for final combustion, substantially as described.

2. The combination of the delivery and inlet orifices of the burner with the partition *c*, substantially as described.

3. The combination of the delivery-orifice of the burner and the shield or its equivalent, substantially as described.

4. The combination of the annular casing, the annular orifice of discharge, and the shield constituting what I call the burner, substantially as described.

5. The combination of the primary chamber and the burner or its equivalent with the secondary chamber or crucible and the air-jet or jets for completing the combustion, substantially as described.

6. The combination of the air-heating chamber K^3 with the primary chamber, substantially as described.

7. The combination and arrangement of the central opening of the burner, the primary chamber, the secondary chamber or crucible, and the receiving-chamber, one above the other, so that the matters to be treated will be carried through them by gravity, substantially as described.

8. The combination of the conical hearth of the receiving-chamber and its discharging-orifice with the crucible, substantially as described and shown in Fig. 6.

9. The passages E', in combination with the flues R and the lower chamber U, substantially as described.

134,783.—*Wood Screw.*—JASON A. BIDWELL and WILLIAM CHISHOLM, Cleveland, Ohio.

Claim.—The improvements, herein described, in wood-screws, and in the manufacture of the same—that is to say, the manufacture of wood-screws of Bessemer or homogeneous steel wire jointly with the reduction in weight of metal in said screws as compared with the ordinary iron screws, due to the superior qualities, and for this purpose the superior adaptability, of Bessemer steel, substantially as set forth.

134,784.—*Steam-Boiler.*—HERMAN CAMP, Roseville, Pa.

Above the fire-box, which is surrounded by water-channels, is a heat-chamber in which are placed a series of water-tubes projecting upward from the water-arch over the grate, and having their top ends closed; between and around which tubes the flame and products of combustion pass on their way to the fire-tubes in the boiler.

Claim.—1. A steam-boiler provided with water-chambers C C D a heat-chamber *f*, tubes *g*, flues *i*, openings *l x*, and fire-chambers B B, all constructed, combined, and operating with relation to each other, substantially as herein before described, and for the purpose set forth.

2. In a steam-boiler, the combination of one or more fire-chambers with the heat-chamber *f*, tubes *g*, and water-chamber D, constructed and arranged substantially as herein described.

3. In combination with the subject-matter of the second clause of claim, the openings *l* and *x*, arranged substantially as herein described, and for the purpose set forth.

134,785.—*Pump.*—FRANCIS CATUDAL, Webster, Mass.

The wooden blocks in which the pistons work are fitted under shoulders formed on the main portion of the pump-frame, and are held in position by bolt-rods, which pass through the blocks and on each side of the main portion of the frame.

Claim.—A pump for domestic and other purposes, the parts A and B B of which are made of wood and combined together by means of the shoulders *a a* and clamping screw-bolts G G G G, substantially as and for the purposes set forth.

134,786.—*Steam-Drying Cylinder.*—WILLIAM CARR COLLIER, Salford, England.

The cylinder is sustained by the T-shaped rings or divisions. The buckets act to force the condensed steam from one chamber to the other, and finally through the hollow journal.

Claim.—1. The arrangement of the troughs or buckets *d d* on the inner surface of a steam-drying cylinder, they being fixed obliquely to the axis of the cylinder in such manner as to drain the condensed steam from one section to another until the water is all discharged from the cylinder, as herein shown and set forth.

2. The combination of the T-iron supporting divisions *b b* with the troughs *d d* and the ejection pipe or spout F, all constructed to operate substantially in the manner as and for the purposes herein set forth.

134,787.—*Watch-Maker's Lathe.*—ROYAL COWLES, Cleveland, Ohio.

A conical split chuck is placed in a hollow mandrel that extends through a loose cone-pulley, the small end of which is divided diagonally, and has pivoted upon it a dog that engages, through a slot in the mandrel, with a notch in the end of the chuck. The speed is regulated by a small friction-roller, made adjustable on a rod, between two cone-pulleys.

Claim.—1. The combination, with the divided and loose pulley E, of the dog *l* and hollow mandrel G, for securing the chuck M, substantially as and for the purpose set forth.

2. The combination of the divided and loose pulley E, hollow mandrel G, driving-pulley F, inclined rod I, and adjustable friction-pulley H, mounted between the standards A C on the lathe-bar B, all constructed, arranged, and operating substantially as herein described.

3. The lathe-bar B, fixed in the support A and carrying the adjustable head-stock and tail-stock, in combination with the loose pulley E, hollow mandrel G, driving-pulley F, and the adjustable friction-pulley H on the inclined rod I, all arranged and operating substantially as and for the purpose set forth.

134,788.—*Butter-Worker.*—DANIEL W. DAKE, Chicago, Ill.

The presser forces the butter through the sieve, whence it falls into the vat and is manipulated by means of the utensils H and I.

Claim.—1. In combination, the hopper B, sieve C, presser D, crank E, and vat A, substantially as specified.

2. The implement I, constructed in the manner described, and for the purposes set forth.

3. The implement H, constructed in the manner described, and for the purposes set forth.

134,789.—*Pot for Melting Glass.*—JOHN DOUGHERTY, Somerville, Mass.

By means of the fine *d* communicating with the openings the front of the pot is maintained at as great a heat as its other sides, thus preventing breakage and insuring an equal fusion of the glass.

Claim.—The within-described pot for melting glass, provided in front with one or more flues, *d*, substantially as and for the purpose set forth.

134,790.—*Cob-Carrier for Corn-Shellers.*—HENRY H. EBY, Mendota, Ill.

Carrier can be turned so as to discharge the corn-cobs in any direction required.

Claim.—1. The combination of the block *b*, adapted to revolve as described, and the hook-bolts *c c*, for supporting a carrier, as described.

2. The combination of the block *b* and the central vertical shaft and its connections, substantially as described.

3. The combination of the frame-work *a a a*, block *b*, the central vertical shaft b^1, pulley b^2, gear-wheel b^3, horizontal shaft with pinion *c* and gear-wheel *c'*, carrier-frame D having belts *d d*, supports d^3 d^4, gear-wheel d^2, arms *e e*, and bolts *m m*, arranged as and for the purpose described.

134,791.—*Treating Damaged Coffee.*—FREDERICK EVANS, New York, N. Y.

Claim.—The process of roasting coffee, herein before described.

134,792.—*Treating Damaged Coffee.*—FREDERICK EVANS, New York, N. Y.

The coffee is placed in a solution of sulphuric acid and water and agitated until the discolorations and impurities are removed. The coffee is then removed from the solution and washed in pure water, and dried by artificial heat.

Claim.—The process, herein before described, of restoring damaged and discolored coffee-beans.

134,793.—*Cloth-Cutting Machine.*—ISAAC FENNO, Boston, Mass.

The hinged knife-carrying arm is made adjustable, and sustained by a spring so as to bring the cutter in proper position with relation to the bed supporting the cloth.

Claim.—The hinged arm *b*, hinge part *c*, and the supporting-spring *f*, combined and operating as and for the purpose set forth.

134,794.—*Leather Punch and Cutter.*—HENRY S. FICKETT, Yarmouth, Me.

A rod with a screw-thread cut in opposite directions from its middle or center serves to keep the guides in position, so that the stock to be punched or cut will always be properly presented for the action of the tool.

Claim.—The combination of the bed A, levers *b* and *c*, segment-gears *i* and *j*, revolving cutter-head *k*, spring *n*, ratchet *m* with the guides *q q* and screw-rod *p*, substantially as and for the purposes set forth.

134,795.—*Saw-Mill.*—WILLIAM GOWEN, Wausau, Wis.

The pawls H H', operated by the lever G, rotate the shaft E, which, by means of bevel-gears, revolve the setting-screw *B*, thus giving a lateral movement to the log.

Claim.—1. The pinion C, gears D D', shaft E, ratchet-wheel F and F', lever G, pawls H and H', all in combination, substantially as described.

2. The lever G, wheel F, and pawl H, in combination with screw M, stop L, and their supporting-bar, substantially as specified.

3. The lever G, in combination with pawls H and H', provided with handle L', projection M', and the eccentric on pawl H, substantially as described.

4. The graduated scales K K and indicator I, in combination with the head-block and operating mechanism, as shown and described.

5. The lever G, indicator I, wheels F and F', and pawls H and H', in combination with screw M, substantially as described.

134,796.—*Flue-Blast for Steam Fire-Engines.*—JOHN GRAENER, Warsaw, Ind.

The blast is arranged laterally to the smoke-stack, in order that the altitude may not be increased.

Claim.—The interposing fan H D, or its equivalent, arranged by means of opening E to create a suction-blast above the flues I I, and by means of pipe F to give an upward blast, substantially as described.

134,797.—*Paper Sizing.*—PATRICK GRADY, New York, N. Y., assignor to JOHN COCHRANE, same place.

Claim.—The compound for sizing paper, of the ingredients substantially as herein described.

134,798.—*Griping-Tongs.*—WILLIAM J. HALLENAS, Brooklyn, N. Y.

The adjustable jaw is kept in place and guided in its movements by arms sliding in lateral slots in the frame.

Claim.—The frame or jaw B, in combination with the bracing-screw C, sliding jaw D with arms E E, and slots F F, constructed, arranged, and operating substantially as and for the purposes set forth.

134,799.—*Can for Preserving Fruits, &c.*—WILLIAM H. HAMMOND, Syracuse, Mo.

Claim.—The can A having a flaring mouth, in combination with the lid C having an inwardly-turned flanged edge, so constructed that when pressed into the mouth of the can it will be held in position by contact of the surface alone, substantially as and for the purpose specified.

134,800.—*Wash-Boiler Attachment.*—SAMUEL B. HARTMAN, Lancaster, Pa.

A wash-boiler attachment, constructed with side pipes which pass through, and in connection with a shelf and deflectors, which serve to conduct the water after passing through the clothing to the center of the boiler and separator, to be again raised by the force of steam through the side pipes, clothing, and perforated plates for further use.

Claim.—The central partition *c*, deflecting shields D, water-shelves B, when the spouts S open beneath them and extend through the perforated surface A of the combined bottom, all arranged in the manner shown, for the purpose specified.

134,801.—*Railway-Car Axle-Box.*—CHARLES W. HARVEY, Buffalo, N. Y.

The packing is confined within a metallic case, the same being held beneath the journal by means of a perforated follower. A lid extends from the top of the box to the oil-reservoir to prevent the oil from escaping.

Claim.—1. The combination and arrangement, in the axle-box and with the journal of a railroad truck, of the perforated follower and partition H and stay-piece M so as to compact the packing material under the journal and form an open oil compartment and reservoir in front of the same, substantially as herein before set forth.

2. The combination, with the perforated bottom H, of the movable concave plate I and stationary concave trough K L, substantially as and for the purpose herein before set forth.

3. The combination and arrangement in the axle-box, between the door thereof and the journal, of the guard-plate R, provided with the flexible strip *r*, substantially as and for the purpose herein before set forth.

134,802.—*Whip-Stock.*—LEVI HEIWOOD, Gardner, Mass., assignor to himself and ELIZA T. WATKINS, same place.

The pores of the wood or rattan are filled with liquid rubber and then vulcanized.

Claim.—1. As a new article of manufacture, a whip with a wooden stock, when the pores thereof are filled with an elastic solid in the manner described.

2. The process herein before described of rendering whip-stock tough and elastic.

134,803.—*Tubular Steam-Generator.*—JAMES M. HICKS, Summit, N. J.

Claim.—The combination of the tube-sheet of a steam-generator and the tubular deflectors described, placed in front of the fire flues or tubes, for the purpose of deflecting the gases against the tube-sheet and circulating the water of the boiler, substantially as before set forth.

134,804.—*Coal-Boring Machine.*—STEPHEN HIPKINS, Jr., Wheeling, W. Va., assignor of one-half his right to RALPH HEATHERINGTON, same place.

Frame G travels longitudinally on bar C, and the slides E, carrying screw feed-tube F and bit-stock *i*, slide between bars C D.

Claim.—1. The combination and arrangement of the movable frame G and the gearing which it carries, and by which the bit-stock *i* is operated, with the feeding-tube F, which carries the bit-stock, and serves to connect the latter with the said frame, the bit-stock tube F and frame G sliding in the same direction in different planes upon the main frame A B, when these several parts are constructed and arranged to operate essentially as described.

2. The arrangement of the frame G relatively to the slides E E, to which it is connected, and the bit-stock-carrying parts, whereby the latter may be moved from one end to the other of the frame A B to continue in the same line of cuts, essentially as described.

3. The screw-standards H^2 H^2 arranged upon the axles H, into which they are swiveled, and connected to the main frame A B by the screw-lugs A' B' as a means for raising and lowering the frame, as described.

4. The hinged or swinging connecting-rods Q' of the moving frame G, arranged as and for the purpose described.

5. The swinging L-shaped pieces L and O, the former on the frame G and the latter on one of the slides E, both carrying gear-wheels, and both adjustable in different positions, by means of which the relative position of the frame G toward the slides E may be changed without changing the gearing by removal, essentially as described.

6. The slides E provided with standards Q, and connected to each other by means of a tube, F, provided with a screw-thread on its outer surface, and with longitudinal openings F' at top and bottom, and serving to carry the hollow bit-stock *i*, essentially as described.

7. The device for feeding the bit-stock toward the coal, consisting of the sleeves W and *s*, inner sleeve A, ring *f* with its projections *g*, and pawl *k*, all operated and operating essentially as described.

8. The combination, with the hollow bit-stock *i* provided with slots *g*, of the sleeve A provided with a slot, *t*, shoulder *f*, and depressions *n*, and a pawl having projections *m* and *o*, essentially as described.

9. The pawl *k* provided with a notch, *r*, by which to raise the pawl and disconnect the bit-stock *i* with the tube F without removing the sleeves W *s* or any of the other parts, essentially as described.

10. The swinging L-shaped piece L having a pin, L^4, in combination with the segmental slotted piece L^5 secured to the frame G, and operating in connection with a nut, L^7, to clamp the piece L when the reversible shaft M is changed, as described.

11. The beveled gear-wheels L^2 and O^2, secured to the extensions L^1 and O^1 of swinging pieces L and O by means of sleeves M^1 and O^3 and collars M^2 and O^4, to allow the shaft M to be removed for the reversal of the gearing, essentially as described.

12. The combination, with the sleeve W and its gear-wheel V, of the gear-wheel U sliding on the bar R, essentially as described.

13. The combination, with the gear-wheel U and bar R, of the toothed wheel R', arm S, pawl S', arm T, L-shaped piece N^3 N^4, arm N^2, sleeve N^1, and eccentric disk N on shaft I for feeding the sleeves W *s* on the tube F, and thereby the bit-stock *i*, essentially as described.

134,805.—*Bit for Boring Coal, &c.*—STEPHEN HIPKINS, Jr., Wheeling, W. Va., assignor of one-half of his right to RALPH HEATHERINGTON, same place.

The bits do not bore as usual, simply with their ends, but their whole longitudinal edges are brought into use, acting as reamers.

Claim.—1. The separate bits *d* fitted in dovetail-grooves *c* on the body *a*, and made adjustable by means of screws *f*, essentially as described.

2. In combination with the bits *d*, fitted in dovetail-grooves *c* in the periphery of the body *a* of a boring-tool, a central bit, A, arranged to extend beyond the ends of the bits *d*, essentially as described.

134,806.—*Hydraulic Engine.*—JAMES C. HODGES, Morristown, Tenn.

From a fore-bay a funnel-shaped conduit leads perpendicularly to the water-box. From this box two throats lead down to the cylinder, and from the cylinder two throats lead down to the waste-pipe. The upper and lower throats are opened or closed by a valve for each pair, which is operated by arms attached to the ends of a double lever. This lever is pivoted at its center, and has motion imparted to it by blocks upon the piston-rod of the engine, which, by striking a cross-bar upon the lower end of the lever, move it toward or from the cylinder.

Claim.—1. In a hydraulic engine, the combination of the head or fore-bay E, cylinder A, water-box C, valves F F', double lever *f* having cross-bar *y*, the caps *c c'*, throats *a a'* and *b b'*, the piston B, and piston-rod H having the blocks *d d'*, constructed and operating as described.

2. The combination of the piston B with the cylinder A, water-box C, valves F F', throats *a a'* and *b b'*, as and for the purpose set forth.

3. The combination of the valves F F', arms *e e'*, levers *f* with cross-bar *y*, blocks *d d'*, and piston-rod H, as herein set forth.

134,807.—*Hanger for Walking-Beams for Oil-Wells.*—MARCUS HULIHOE, Emlenton, and WILLIAM J. LEWIS, Oil City, Pa.

The pump-rod may be adjusted up and down in the truncioned holder D by means of the screws, and the holder and rod together may be detached from the hanger by raising the cap-pieces.

Claim.—1. In combination with the walking-beam A, the hanger B having journal-bearings *a a'* at its lower end, slotted vertical adjustable cap-pieces C C', and oscillating pump-rod holder D, when said parts are constructed and operating in the manner and for the purpose herein set forth.

2. As a new article of manufacture, the hanger B, constructed as herein described.

134,808.—*Medical Compound for Liniment.*—HENRY J. KINTZ, Greece, N. Y.

Claim.—The compound consisting of castor-oil, glycerine, alcohol, bay-rum, port-wine, oil of winter-green, and bergamot, in the manner substantially as herein described and specified.

134,809.—*Mowing-Machine Knife Grinder.*—MELVIN W. KNOX, Sheridan, N. Y.

Claim.—1. The combination, with the standard or bearing B, of the pivoted and slotted frame-lever C and driving and grinding wheels E F, both mounted in the frame-lever C, substantially as herein before set forth.

2. The combination, with the frame-lever C and grinding-wheel F, of the pivoted bearing G, for adjusting the face of the grinding-wheel to the bevel of the knife, substantially as herein-before set forth.

3. The combination, with the slotted frame C, driving-wheel E, and grinding-wheel F, of the pivoted standard B and socketed base *a*, substantially as and for the purpose herein before set forth.

4. The combination, with the slotted frame C, and standard B provided with the slot *b* of the pivot-bolt *d* and nut *d'*, whereby said frame is rendered vertically adjustable and capable of longitudinal movement, substantially as herein before set forth.

134,810.—*Feed-Regulator for Calender-Rolls.*—MARTIN LAWLER, Holyoke, assignor of one-half his right to OSCAR S. GREENLEAF, Springfield, Mass.

A series of teeth are adjustable vertically in a supporting-bar adjustable in the cross-heads over the upper or feeding roller.

Claim.—In combination with the feed-roll B of a calender-frame, the device for regulating the feed thereto, consisting of the adjustable bar M containing the adjustable teeth *h h h*, &c., and supported from the bars *a b* by the adjustable cross-heads E E, substantially as shown and described.

134,811.—*Sediment-Collector and Blow-Off for Steam-Boilers.*—JOHN P. LEONARD and GEORGE HANCOCK, Oroville, Cal.

A perforated tube is arranged in the bottom of the boiler, and a sliding pipe, having a blow-off cock, is inserted from the front end of the boiler into the perforated tube. The sediment is collected into the tube and blown through the sliding pipe.

Claim.—The perforated tube B, in combination with the sliding pipe or tube C and blow-off cock *c*, constructed and arranged substantially as and for the purpose above described.

134,812.—*Curtain-Cord Rack.*—WILLIAM D. LUDLOW, New York, N. Y.

A notched or perforated plate slides freely in the outer case or frame, and is held in position by a spring placed in the upper part of the frame and by the foot of the cord-slide, which engages in the notches on the sliding plate.

Claim.—The flat plate B, having the stamped notches upon its upper surface, sliding freely in the case D D, and held in position by the single footed holder A A' and spring C, when all are combined to operate substantially as set forth.

134,813.—*Fastener for the Meeting-Rails of Sashes.*—THOMAS P. L. MAGOUN, Worcester, Mass.

A locking-case, secured on the meeting-rails of the sashes, is provided with a flanged locking-bolt, having a spring in its rear to cause it to engage automatically with the catch-plate, a knob or handle projecting upward through a slot in the case and serving to draw it back by hand. At the side of the bolt, above its flange, is arranged an angular-shaped catch-dog, so constructed that when the bolt is drawn back the dog will, by its own weight, drop down between the end of the flange and the side of the lock-case, its lower end extending through a slot in the same. There is also a tripping-leg, projecting horizontally from the lower part of the catch-plate, (in a groove of the meeting-rail,) which is brought into contact with and raises the dog by the operation of closing the sashes, thus relieving the bolt and allowing the spring to throw it forward and lock the two sashes in position.

Claim.—The combination, with the flanged locking-bolt g E and tripping-leg K, of the catch-dog I, arranged to drop by its weight in front of the flange *e* when the bolt is drawn back, retaining said bolt while the sash is raised, substantially as herein shown and described.

134,814.—*Parallel Ruler.*—WILLIAM B. MASON, Boston, Mass.

To one of the linked parallel bars is attached a transverse graduated gage-bar having a series of detent holes, and a spring-stud for holding the same in any desired position in connected with the other parallel bar.

Claim.—The clamps *e e'* and their set-screws *f f'*, in combination with the links *c d* of the bar *b*, the graduated arm *g*, and its catch-lever *h*, substantially as and for the purpose stated.

134,815.—*Mortising-Machine.*—CHRIST MUSCHAL, Pittsburg, Pa.

The augers are operated by a screw-shaft, having an internal gear-wheel, driving pinions on their shanks. The chisels of rectangular form are attached to the augers and forced down with them.

Claim.—1. The inverted cup-shaped gear-wheel *c* having an internal gear, *c'*, operating the auger-shafts *e' e'*, in combination with the sliding frame D, screw b^3, and frame B^3, substantially as and for the purpose set forth.

2. The shafts *e' e'* and augers *e e*, in combination with the plate D' provided with dovetail joint and chisel *f*, substantially as and for the purpose specified.

134,816.—*Washing-Machine.*—EDWIN NORTON, Boston, Mass.

The clothes are put between the disks K and E, the shaft C is screwed up until the required pressure is brought to bear upon them, after which the disk K is made to oscillate by swinging the handle H back and forth.

Claim.—The combination of the screw-rocking shaft C, nut D, and the reversible disks K and E, all constructed and operating substantially as described, and for the purpose set forth.

134,817.—*Dredger.*—RALPH G. PACKARD, Brooklyn, N. Y.

The scoops are hinged near the outside and open in the center. The opening and closing are effected by means of the rising-and-falling shaft carrying the large and small pulleys, operated by chains R8 R8. The teeth of the scoop are formed of two metallic plates each, between which, at the extremity, is bolted the cutting-point P. The upper and outer edge of the scoop is prolonged into a cutting-edge.

Claim.—1. The scoops hinged at or near the outside, opening from a center line with flaks or arms attached at or near the center for opening and closing them, as described and specified.

2. The teeth of skeleton scoops which open from a center line, constructed of two plates of metal secured together, in the manner and for the purpose specified.

3. The links or braces L and L', connected to the teeth T T of skeleton scoops, in the manner and for the purpose specified.

4. The cutting-points P P secured to the teeth of skeleton scoops, in the manner and for the purpose specified.

5. The combination of the chains R8 and D D, and R8, and U U with the shaft S and its connections, in the manner and for the purpose specified.

6. The small wheels V V, constructed and arranged to adjust the chains, in the manner and for the purpose specified.

7. The adaptation of the upper edge for cutting, of buckets whose scoops open from a center line, in the manner and for the purpose specified.

8. The guide-poles H H hinged to the bucket, and used in combination with the chain C or other suitable holding-down apparatus, in the manner and for the purpose specified.

9. The chain C, in combination with the hinged guide-poles H H, when used in the manner and for the purpose specified.

134,818.—*Machine for Slotting the Heads of Screws.*—ELIJAH S. PIERCE, Hartford, and JARED A. AYERS, Groton, assignors to NATIONAL SCREW COMPANY, Hartford, Conn.

A pair of griping-jaws; an adjustable stud for gaging the extent of projection of the screw-head beyond the jaws; a follower, operated by a wedge, to force the blank forward against the stud; a rotatable semi-spherical anvil, on which the blank rests, but which is partially rotated when the blank is finished and allows it to fall from the jaws; a reciprocating saw made in sections, each succeeding section being set to cut a little deeper than that which precedes it; a rasp at the heel of the saw to remove asperities produced by the saw, and means to elevate and depress the saw-carriage, and thus adjust the saw to the plane of the axis of blank, all combined and operating automatically.

Claim.—1. A reciprocating saw or series of slotting-tools, in combination with a pair of griping-jaws, when the same are so connected by machinery, substantially such as described, that the jaws close automatically and hold the blank at the time when the saw moves over the face thereof to cut the slot, the combination being substantially such as described.

2. In combination, a reciprocating saw or series of slotting-tools, a griping apparatus, and a rasp, all being and acting substantially as specified.

3. In combination, a wedge and a stop, acting substantially as described, to locate the blank, the wedge also serving to prevent end-wise displacement during the operation of slotting, the combination being substantially as specified.

4. The combination of a wedge and a stop with a pair of griping-jaws which gripe the blank after it is located, the combination being substantially such as specified, and acting to locate the blank and hold it against both lateral and end-wise displacement while being slotted.

5. In combination, a transferrer, a pair of griping-jaws, a discharger, and a reciprocating saw, all being and acting substantially as specified; and, in combination with these elements, we claim a rasp, acting as described.

6. In combination with a reciprocating slotting device or saw and a pair of griping-jaws, adjustable ways in which the saw-carriage slides, whereby the saw may be so adjusted as to move in proper relation to blanks held between the griping-jaws, all these parts being and acting in combination substantially as specified.

134,819.—*Indicating-Filler for Lamps, &c.*—JOHN A. RYAN, Cleveland, Ohio.

Within a tube is fitted loosely a float, the stem of which passes through a cap to which is secured an index-plate. The upper portion of the tube is inclosed in a chamber open at bottom; through this chamber the fluid is poured, and as it rises the float indicates the height. The air escapes through a vent-tube arranged in the chamber.

Claim.—The herein-described lamp-filler, consisting of the central tube B, shell or chamber E, ventilating-tube H, mouth-piece I, index-plate G, float C, and pointer L, all constructed and arranged to operate in the manner as described, and for the purpose set forth.

134,820.—*Treadle for Sewing Machines.*—AI B. SHAW, Medford, Mass.

The mechanism is actuated by a treadle and runs upon the same stud as the balance-wheel.

Claim.—A mechanism actuated by a treadle or treadles and running upon the same stud as the balance-wheel, when said mechanism is connected with the balance-wheel by a clutch or coupling, substantially as described.

134,821.—*Row-Lock.*—JAMES M. K. SOUTHWICK, Newport, R. I.

A falling latch is pivoted, at its lower end, in a slot formed in the lower side of the row-lock pintle. This latch closes into the slot while passing through the socket, and, having passed down below the edge of the socket, it falls out by its own weight and catches under said edge, thus forming a secure stop to prevent the row-lock pintle from rising out of place.

Claim.—The combination of the row-lock A, catch *c*, and socket C, substantially as described, and for the purpose set forth.

134,822.—*Composition for Coating Metal Pipes, Roofing, &c.*—JOSEPH SPECHT, Memphis, Tenn.

Claim.—1. The compound of coal-tar, gum-pitch, pine-pitch, and unslaked lime, or their equivalent, in about the proportions and for the purpose specified.

2. The compound of coal-tar, gum-pitch, pine-pitch, unslaked lime, or equivalents, combined with asphalt, in about the proportions and for the purpose set forth.

134,823.—*Rubber Jam-Nut.*—WESTLY TODD, Allegheny City, assignor to himself and EDWARD A. KIMMILER, Pittsburg, Pa.

A circular nut, made of vulcanized rubber, the hole a little smaller than the bolt, has its periphery covered by a thin metallic band, the edges of which are turned down a little to embrace the ends of the nut.

Claim.—A new article of manufacture, viz., a gum jam-nut, with the walls of its opening parallel and the diameter of the said opening less than the diameter of the bolt upon which it is to be placed, the periphery of the said nut being surrounded with a band of thin sheet metal, substantially as hereinbefore described, and for the purpose set forth.

134,824.—*Cultivator.*—AUGUSTUS C. TOWER, Mendota, Ill.

A straddle-row cultivator having a series of curved knives, a pair of smoothing-beams, and following-teeth for removing clods.

Claim.—1. The series of knives *a a* set at an angle, as described, and adapted to work upon each side of the hill, substantially as described.

2. The combination, in a cultivating-machine, of the following elements—*i. e.*: A pair of beams adapted to operate upon each side of a row of corn, having a series of curved inclined knives set at an angle, as described, a pair of following smoothing-beams and suitable means for connecting the two, substantially as described.

3 The combination, in a cultivating machine, of the following elements—*i. e.*: A pair of beams having knives *a a*, substantially as described, a pair of following smoothing-beams, means for connecting said beams, and teeth adapted to pass the hill on each side and remove the clods, substantially as described.

4 In a machine of substantially the described construction, an adjustable rod, D, carrying adjustable harrow-teeth arranged one in advance of the other, substantially as described.

134,825.—*Friction Driving-Gear.*—WILLIAM W. TUNIS, Easton, Md.

On a bed are arranged bearings, in which a shaft is supported, so that it may freely turn therein, but prevented by shoulders or collars from having any longitudinal play. Upon this shaft is arranged the crank or band wheel by which it is driven. Centrally upon shaft there is a disk, E, of such diameter as the special kind of machinery to be driven. In two other bearings, F, a shaft, G, is supported, which carries a second disk, H, that turns with said shaft.

Claim.—1. In combination with the driving and driven disks E H, and the pairs of friction-wheels *a a'* and *b b'* operating therewith, one pair on each side of said disks, the hinged bearers *g* and mechanism for operating them, as and for the purpose described.

2. In combination with the driving and driven disks E H and the friction-wheels *a a'* and *b b'*, working in pairs on opposite sides of said disks, the hinged bearers *g* and sliding plate I, and mechanism for operating them, as and for the purpose described and represented.

134,826.—*Attachment for Sewing Machines.*—FRANCIS N. VIOLET, Fond du Lac, Wis.

Device adapted to act as a guide for one or more pieces of cloth or to lap the edges or to allow one edge to project beyond the other. When one edge is to project beyond the other for felling, then the pivoted gage is employed.

Claim.—1. The gage A with its tongues B B and the adjustable guide E, when constructed, arranged, and operating as set forth.

2. In combination with the above, the pivoted gage C, as and for the purpose described.

134,827.—*Oil Painting.*—JOHN C. WALKER, Washington, D. C.

A water-colored engraving, &c., is covered by "crash" or other woven material, pasted on, and afterward colored in oil.

Claim.—1. The mode herein described of producing oil-color paintings from water-color pictures, engravings, or other prints.

2. An oil-painting, produced substantially as described, and by the method set forth.

134,828.—*Clothes-Drier.*—DAVID R. WATSON, Moawequa, Ill.

A clothes-drier with a standard resting on cross-timbers, which furnish its support and foundation, and to which is attached a hinged pin or stake, by which the frame is supported in its upright position when used out-door. Pivoted to the standard by a spider are four uprights, which are furnished with lines to receive the clothes, and above the pivot or spider are four braces, which connect and hold the uprights in position, attached to a point or pin in the standard, from which they can easily be detached and the arms folded into a close position.

Claim.—The combination of the standard A, feet *a a a a*, hinged pin B, collar C, arms *c c c c*, braces *f f f f*, and pivot *g*, as shown and described, and for the purpose set forth.

134,829.—*Needle-Case.*—GERHARD WEMPE, San Francisco, Cal.

The needle-case is divided into separate pockets, and the upper half folds back by a hinge. The whole is inclosed in a separate case.

Claim.—The needle-holder, consisting of the hinged back A, subdivided into pockets by the stripe *b b*, and with the cover C for the points arranged to slide within the case F, as described.

134,830.—*Reed-Organ.*—GEORGE WOODS, Cambridgeport, Mass.

Tuned forks with a sounding-board are attached to the reed-organ, and both operated by one set of keys.

Claim.—1. In combination with a reed organ, the vibratory sounding-hooks and a sounding-board, *p*, when arranged in a manner and for the purpose herein set forth and shown.

2. In combination with a reed-organ, the piano-stop consisting of the rod 22, lever 18 19 21, slotted piece 20, inclines 14 15, and operating-rod 16 as and for the purpose set forth and described.

134,831.—*Heel for Knives for Reapers and Mowers.*—ROBERT ALLSTATTER, Hamilton, Ohio, assignor to LONG and ALLSTATTER, same place.

Claim.—1. A heel or pitman attachment for reaper and mower knives, consisting of a rolled ribbed iron bar of the required form with a steel facing welded to it, for the purpose of providing a steel bushing for the pitman pin or journal without loss of strength in the heel, substantially as and for the purpose specified.

2. A heel or pitman attachment for reaper or mower knives, composed of the iron B B' and the bifurcated steel facing C, which is welded to the iron, having a neck, *c*, to enter a corresponding groove, *a*, in the lug B' of the iron, substantially as and for the purpose specified.

134,832.—*Casting Fire-Grates.*—HENRY ANSHUTZ, Allegheny, Pa.

Claim.—As a new article of manufacture, a fire-grate, A, provided with curved supporting or locking hooks C, substantially as and for the purpose specified.

134,833.—*Fly-Trap.*—SAMUEL B. HACHELLER, McDonough, N. Y.

The case is divided centrally by a slide. At the top it is covered with wire-gauze. At the base are doors or openings, and in the lower chamber are fans, operated by gear-wheels. When the flies have entered this the openings are closed, the central slide is withdrawn the fans are operated, and the flies ascend to the upper chamber, where they are secured.

Claim.—The herein before-described device consisting of the casing A divided into compartments F and G by means of the slide H provided with the doors K, and containing the pivoted fans K *k*, and *k'*, substantially as and for the purpose specified.

134,834.—*Chair.*—LEWIS H. BAKER, Washington, D. C.

The two grappling-plates are applied to the under side of the chair-bottom, which has a joint where the leg is inserted. A small projection is inserted into the side of the leg, and then the plate is fastened by means of screws. Instead of the projection for seizing the plate a wood-screw may be employed, the plate being provided with a flange.

Claim.—The above-described grappling plates H H' for fastening the legs and joints of the seats of chairs and for other similar purposes, combined substantially as set forth.

134,835.—*Water-Elevator.*—AMOS BADING, Wheeling, W. Va.

A weight, in descending, turns a shaft upon which is a escape-wheel that is also turned through the medium of a ratchet and pawl upon the shaft. The rotation of the escape-wheel vibrates a pallet, shaft, and crank, and effects the reciprocation of the pump. The water, passing into the trough, raises a float and causes a tooth to enter a notch in the pendulum, and thus stop the machine. The falling of the float sets the machine in motion again.

Claim.—1. The combination, with the shaft B bearing the escape-wheel D and driven by a weight or other motor, of the shaft C bearing the pallet G and crank *c*, and a pump connected with the crank, in the manner herein described, all substantially as set forth.

2. The combination, with the shafts B C, escape-wheel D, and pallet G, of the pendulum H and the stop apparatus I *w*, actuated by a float, spring, or other motor, substantially as specified.

134,836.—*Inkstand.*—STEPHEN W. BALDWIN, Yonkers, N. Y.

A spring passing through an eye at the front of the cover supports it in an open position, while the pen-holder, when interposed between the spring and an armed frame, retains it closed.

Claim.—1. The within-described covered inkstand, in combination with an elastic pen-rack, the parts being so arranged that

the introduction of the pen-handle into the rack closes the cover of the inkstand, and its removal liberates it, substantially as herein specified.

2. In combination with the body A, abutment E, and hinged cover B *b b'*, the spring D, constructed and arranged as shown, so that the spring shall perform the double function of holding open the cover in one condition, and of holding it tightly closed in another, as herein specified.

134,837.—*Shuttle-Guide for Looms.*—JOSEPH B. BANCROFT, Hopedale, Mass.

The bands are secured to the ends of the spring, and are held in the brackets by wedges.

Claim.—1. A guide composed of a metallic helical spring, A, and two in elastic bands, B B, as described, extended from such spring in manner as set forth.

2. The arrangement and combination of the wedges *a a* with the brackets C C, and the elastic shuttle guide composed of the metallic helical spring A and the two inelastic bands B B, all being as explained and represented.

134,838.—*Balanced Slide-Valve.*—THOMAS BEESLEY, Muscatine, Iowa.

Two valve-seats on opposite sides of a projection from the ordinary valve-seat, with a slide-valve upon each seat connected by pressure-bars at their ends, which project beyond the seats and are adjusted by temper-screws, so as to work steam-tight.

Claim.—The grooved projection A N with valve-seat B on its opposite sides, and the valves C with the pressure-bars D, one valve being permanently and the other adjustably connected at their projecting ends, as and for the purpose described.

134,839.—*Bed-Bottom.*—AZEL H. BELL, Cedar Falls, Iowa.

Alternate longitudinal slats are secured at their ends by alternate staples, and adjustable transverse bars, fitted to the slats, regulate their tension.

Claim.—The adjustable transverse slats D, in combination with the reversible spring-slats B, sectioned alternately at opposite ends of the frame of the bed-bottom, substantially as specified.

134,840.—*Car-Starter.*—LORENZO D. BENNER, Boston, Mass., assignor to himself and NORTHEND AND FOSTER, same place.

Beneath the car is secured an air-tank, which has an air-pump and an air-cylinder in combination. Air is compressed within the tank by means of the piston of the air-pump, being connected by a link to an eccentric on the axle. This link can be thrown out of or in working connection with the piston. To the end of the air-cylinder piston is pivoted a pawl, and by an arrangement of levers, when the pawl is applied to the ratchet on the axle, a valve is opened from the tank into the air-cylinder, forcing out the piston and partly turning the axle.

Claim.—In combination with the ratchet *q* and pawl *p*, the air-pump *f*, compressed air-tank *e*, and air-cylinder *s*, and their connections, by which, at the will of the driver, air is driven into the tank for storage, or is let into the cylinder *s* to work the pawl and piston-rod *r*, substantially as described.

134,841.—*Horseshoe-Nail Machine.*—ALBERT D. BINGHAM, Vergennes, Vt.

Three pairs of rolls; the first pair has grooves, two sets, corresponding to the width and thickness of the nail, with deep recesses to form a head at right angles to the width: the second is plain, and roll down the head to the proper size; and the third finish the blank, the nails being formed in a strip, the point of one attached to the head of the next, to be afterward cut off and pointed.

Claim.—The combination of a series of preparatory roller-dies, C D, flattening-rolls E, and a series of finishing roller-dies, H I, substantially as represented in the drawing, and so as to operate upon the rod in forming the head, as specified.

134,842.—*Oil-Can Stopper.*—LEWIS R. BOYD, New Brunswick, N. J.

The stopper is composed of two pieces. The cap piece, which is provided with a vent, being struck up, is fitted over and bent under a flange upon the lower piece. The lower piece is spun up and threaded in the same manner as the socket, and has a vent at its conical portion.

Claim.—1. The within-described screw-stopper, composed of the two pieces *a* and *b* of sheet metal, formed and attached to each other in the manner described.

2. The hollow screw-stopper having a conical termination, with a vent-hole, *m*, and a vent-hole, *d*, at the top, all as set forth.

134,843.—*Sofa-Bedstead.*—JOHN BRADA, New York, N. Y.

A removable head-piece for the extension part of the sofa, attached by tenons and sockets. Also, folding legs that are jointed and slide in a horizontal slot in the frame of the sofa, and bolts to hold the legs in an upright position.

Claim.—1. The within-described sofa-bedstead having an interior space capable of stowing the removable portion C c^1 c^2 of the head and deep sockets b^1 b^2, in combination with the removable piece C provided with deep tenons c^1 c^2, adapted to apply in the position and be supported and stowed in the manner herein specified.

2. The jointed folding legs P *p*, in combination with the folding part B, and sliding in and out therein, as and for the purposes specified.

3. The locking-bolts E, in combination with the folding legs P *p* and the parts A *a* B, as and for the purposes herein specified.

134,844.—*Apparatus for Treating Ofal.*—WILLIAM L. BRADLEY, Boston, Mass.

The plow-shaped arms mix the material. The wide mouths of the arms form large outlets for disseminating air-currents through the mass.

Claim.—1. In combination with the drum or cylinder and its hollow shaft or axle *g*, the air discharging and directing radial arms *l*, substantially as described.

2. The air-directing arms, formed with the flaring sides *o*, mouths *n*, and angles *p*, substantially as shown and described.

134,845.—*Die for Capping Screws.*—GEORGE W. BRIGGS, New Haven, Conn.

The usual metallic piece that enters the slot in the cap and head of the screw is in this instance the edge of a washer. The washer can be turned as its working-face becomes worn and battered, and another and fresh part of its periphery brought into operation. The washer rests upon a concave bed, beneath which there is a spring that permits the washer to yield when necessary.

Claim.—1. The circle piece or guide E, in combination with the rest B, stem C, spring D, and slotted and recessed die F, substantially as herein shown and described, and for the purpose set forth.

2. The concavity formed in the head of the stem or holder C to give a wide bearing to the edge of the circle piece or guide E, substantially as herein shown and described.

134,846.—*Machine for Sawing Laths.*—SAMUEL P. BROWER, Glen's Falls, N. Y., assignor of one-half his right to WILLIAM H. KNOX.

The upper feed-rolls are placed at the extremities of adjustable levers and operated by pitch chains running over sprocket-wheels, which arrangement allows their position to be changed vertically. Guide rolls are also placed in the bed of the machine in advance of the feed-rolls.

Claim.—1. The cross levers D D carrying the feed-rollers C C, and adjusted by the set-screws E F, substantially as and for the purposes set forth.

2. The combination of the feeding-rollers C, chain-pulleys A and B, face-plates H and J, friction-wheel I, and chain *d*, or its equivalent, all substantially as and for the purposes herein set forth.

3. The combination of the cam G and its shaft, friction-box M, bracket P, shaft A, friction-wheel I, and face-plate H, all substantially as and for the purposes set forth.

4. The hinged lever and oil-cup L, in combination with the shaft K and face-plate J, and operated by the cam-lever K, all substantially as set forth.

5. The combination of one or more guide-rollers, O, one stationary and one adjustable feed-roller, C, and the gage R, all substantially as set forth.

6. The frame T and fingers, as shown in Fig. P, substantially as and for the purposes set forth.

134,847.—*Crib Attachment for Bedsteads.*—EDWIN F. BRYAN, Savannah, Ga.

The crib is attached to the bedstead by adjustable hooks, and braced by the brackets underneath. A removable railing is placed upon the top of the back.

Claim.—1. The combination of the hooks C and brackets D with the crib B, to adapt said crib to be detachably attached to the side rail of a bedstead, substantially as herein shown and described, and for the purposes set forth.

2. The combination of the detachable railing E with a crib, B, provided with hooks C and brackets D, substantially as herein shown and described, and for the purpose set forth.

134,848.—*Loom-Shuttle.*—HEZEKIAH H. BRYANT, Boston, Mass.

In combination with the "float-preventive" mechanism arranged within the shuttle, a spring-guard is placed over the upper end of the oscillating dog so that it shall not be operated by any other cause than that producing floats. The dog is provided at its lower end with a longitudinal-toothed arm, for the purpose of catching the thread and breaking it when the dog is thrown into an oblique position.

Claim.—1. In combination with a float-preventive mechanism, the guard F or its equivalent, substantially as and for the purpose specified.

2. The herein-described combination and arrangement of the spring E and the dog D, composed of the upright arm *d* and the longitudinal toothed weft-catcher *c*, the whole affixed to the support *a a a* and to the shuttle, substantially as or for the purposes set forth.

134,849.—*Sliding Support for Clothes-Lines.*—MICHAEL BURGER, Jersey City, N. J.

A sliding supporting-brace for clothes-lines constructed with a slot for the pulleys, and on one side of it, near its lower end, has an opening which forms a spring, by which the cord is introduced and held in place by the spring, or released at pleasure through the opening.

Claim.—The slotted support or brace A *a* for pulley-lines, having one of its sides cut through to form a spring, substantially as specified.

134,850.—*Tip-Chair.*—BERNARD A. CARLAN, New York, N. Y.

The chair is made with the front legs longer than the back ones, so that the chair is always tipped or inclined, and is provided with extra back legs or braces to support it in such inclined position.

Claim.—The chair having the inclined seat and back and back braces E, as set forth, for the purpose specified.

134,851.—*Process for Cutting and Shaping Pearl Shell.*—EDWIN CARRINGTON, West Meriden, Conn.

A thin disk of steel is employed which revolves rapidly. Against the smooth edge of said disk the shell to be cut is pressed, a supply of water being furnished to prevent heating.

Claim.—The process herein described for cutting, dressing, or shaping pearl-shell.

134,852.—*Nail-Distributing Machine.*—CHARLES M. CHASE, Boston, assignor to E. L. BAKER, New Bedford, Mass.

The nails are thrown in a mass into the hopper, and are arranged for and presented to a pair of transferring-jaws by means of bent wires attached to a rotating shaft. These jaws grasp the nails singly and carry them down through an opening of peculiar construction, which prevents the nails from moving endwise. The jaws then release them, and they fall crosswise of and upon an inclined tapering trough, when the greater weight of the heads of the nails causes them to slide down head foremost.

Claim.—1. The combination of the wires L' with the slide B, operating substantially as described, and for the purpose set forth.

2. The combination of the jaws D and E with the horns H, substantially as described, and for the purpose set forth.

3. The opening *d* of the shape described, for the purpose set forth.

4. In a nail-distributing machine, the trough H^2, when formed as described, and for the purpose set forth.

134,853.—*Spring for Vehicles.*—EDWARD CLIFF, South St. Louis, Mo.

Claim.—1. The spring consisting of plates A B whose ends are firmly secured to hinged bearing-blocks C, all substantially as set forth.

2. The combination of spring-plates A B, blocks C, and rocking bearing D E, substantially as set forth.

3. The combination of spring-plates A A' B B', clip-connections G H I, and hinged bearing-blocks C, substantially as set forth.

134,854.—*Potato-Bug Collector.*—JOSEPH CORBELL, Lind, Wis.

An insect-destroyer constructed with revolving beaters which revolve over a V-shaped receptacle, pivoted to hangers beneath the beaters to catch the insects when knocked off. The beaters are provided with adjustable plates so as to reach plants of different heights. It further consists in rotating the beaters each in opposite directions.

Claim.—1. The combination of the revolving beaters E, the V-shaped trough H, and the vertical plate G, when constructed and arranged to operate as set forth.

2. The rotary beaters E having their blades provided with the adjustable plates *i*, whereby they are adapted for operating upon vines of different heights.

3. In combination with the beaters E, the adjustable trough or receptacle, constructed substantially as described, so that its width may be varied, as required.

4. The combination of the rotary beaters E, provided with pulleys *a*, the roller *c*, and the driving-pulley *c* with the belt *f*, when arranged as described, so that it revolves the two beaters in opposite directions, as set forth.

134,855.—*Combined Corn-Planter and Seeder.*—ROBERT COWAN, Bloomfield, Ill.

A frame, supported on a pair of wheels behind and by spouts and drills in front, has across the top of the latter a seed-box with a shaft revolving in it by a belt from one of the wheels. This shaft has at its ends seed-cups for corn-planting, and between them a series of grooves in planes perpendicular to the axis. The bottom of the hopper communicates by flexible tubing with the two outside drills for corn-planting, and with the others for seed-sowing. Slides in the hopper regulate the communication, as one or the other operation is required.

Claim.—The seed-hopper D, constructed with end grooves Z and oblique guides, as described, to receive the slides F and *f* interchangeably, substantially as and for the purpose specified.

134,856.—*Child's Carriage.*—JESSE A. CRANDALL, Brooklyn, N. Y.

The handle is made reversible by being swiveled to the under side of the carriage.

Claim.—The handles D *a a* attached to a swiveled plate, *b*, combined with a body, A, and running-gear B, connected by a disk, *d*, as described, so that the handles can turn horizontally, as set forth.

134,857.—*Slotting and Key-Seat Machine.*—JOHN H. CRANSTON, Norwich, Conn.

The tool is held longitudinally in the upper end of the tool-post, which is operated vertically through a slot in the bed or table. The bed slides on ways and has the work bolted to it, which is fed up to the cutter by means of a feed-screw acting on the bed.

Claim.—The within-described slotting-machine having a tool-carrier traversing through a table and operated by suitable mechanism below, in combination with provisions for moving the table independently, the whole arranged so as to afford a clear space above the table adapted to serve as herein specified.

134,858.—*Inhaler.*—WILLIAM R. CRUMB, Buffalo, N. Y.

The body of the instrument is composed of three tubes placed side by side. To the upper ends of the two outer ones are secured nozzles to fit the nostrils. The central tube communicates at one end with the two outer inhaling-tubes, and with the external air at the other, and contains the proper materials for inhalation distributed upon a sponge or other suitable vehicle. One end of the central tube is closed by a plug when the instrument is used for the nostrils, but when the instrument is used for the mouth the plug is replaced by a nozzle.

Claim.—1. The combination, with the inhaling-tubes A A, provided with nozzles arranged to fit each nostril, of the central tube B lying between and communicating with the tubes A and external air, substantially as hereinbefore set forth.

2. The combination, with the tubes A A B, arranged as described, of the nozzle *c*, substantially as and for the purposes hereinbefore set forth.

134,859.—*Clip-Plate for Carriage-Springs.*—NORMAN C. DEAN, Union Springs, N. Y., assignor of one-half his right to SILAS S. BLISS, same place.

Provided with re-enforced grooves for the reception of the clips which hold the spring to the axle, and a hole for a central bolt.

Claim.—The metallic plate A, constructed as herein described, having the central vertical hole *a*, parallel transverse flanges *c*, and re-enforced channels *b* adapted to receive the spring-clips, substantially as and for the purpose set forth.

134,860.—*Music-Desk for Pianos.*—MICHAEL DOHERTY, Cambridgeport, Mass.

Pins on both sides of the desk slide in a three-way groove, (two horizontal and one downward and inclined to the front,) for the desk to stand in or lie flat either way, forward or back.

Claim.—1. The angular grooves *c*, having portions *d* and either *f* or f^2, and the pins *a* a^2 and *b* b^2, in combination with a desk, A, and blocks B B, substantially as described, for the purpose described.

2. In combination with the above desk and blocks, the combination in one and the same angular groove *c* of the portions *f* f^2 and *d*, substantially as and for the purpose described.

134,861.—*Medical Inhaler.*—NILES I. DONALDSON, Worcester, Mass.

A receiving-vessel is furnished with two inlet-tubes and one outlet, all three passing through perforations in the cork. The two inlet-tubes are furnished at their outer ends with two funnels. Midway of their length and within the receiver they are bent slightly upon themselves and furnished with pendent bulbs to contain the medicaments for inhalation. The funnels serve as valves to prevent the too rapid ingress of air.

Claim.—1. The combination, with the receptacle in an inhaling apparatus, of the peculiarly-constructed inlet-tube C provided with a bulb, D, upon the lower side of the bent or horizontal portion *a* of the tube, substantially as and for the purposes set forth.

2. The combination, with the inlet-tubes C C', of the tunnels or valves F, substantially as and for the purposes set forth.

3. An inhaling apparatus, consisting of a main receptacle, A, having a single opening provided with a stopper, B, inlet-tube or tubes C, liquid bulb or bulbs D upon the lower side of the bent or horizontal portion of the tube which is within the main receptacle, and draft-tube E, all combined and operating substantially as set forth.

134,862.—*Carriage-Curtain.*—HENRY DONNELL, Philadelphia, Pa.

A carriage-curtain permanently fastened at the top and weighted at the bottom, is provided at its sides with loops running in suitable guides, and arranged, when folded up, to be secured to the inside of the eaves-rail by ordinary loop-fastenings.

Claim.—1. A carriage-curtain, B, permanently secured at the top, provided at its opposite sides with rings *s* adapted to suitable guides D, and arranged, when gathered up or folded, to be secured to the inside of the eaves-rail or roof of the carriage, substantially as specified, and for the purpose set forth.

2. The carriage-curtain guiding-rail D, cast with grooves *i i* and a flange or flanges, *j*, as specified, and for the purpose set forth.

134,863.—*Spindle-Bolster and Step for Spinning-Frames.*—GEORGE DRAPER, Hopedale, Mass.

To enable oil to be introduced and raised to the upper bearing of the spindle while the same is in revolution; to catch any oil that may flow down when the spindle is at rest; and to form a guide for correctly raising and lowering the step-cover, as well as to prevent the band touching the spindle in case it should slip off the whirl.

Claim.—1. The bolster-standard B and the spindle A, provided with the oil-receiver *e*, educt *f*, helical oil elevator or groove *d*, oiling-induct *g*, and the rotary oil-reservoir *b*, the latter being fixed to the spindle, and also being arranged substantially in manner and to operate as specified.

2. The oil-reservoir *b*, fixed to the spindle so as to revolve therewith, and arranged within a chamber, *a*, in the foot of the bolster-standard, all being essentially as shown and described.

3. The step provided with the communicating oil-chambers *l m*, the tubular extension *k*, and the cap *n*, all arranged essentially as specified and represented.

134,864.—*Spinning-Frame.*—GEORGE DRAPER, Hopedale, Mass.

A train of gears, connecting the loose pulley of the frame with the "tin drum," imparts slow motion to the latter when the belt is shifted onto said pulley, so that breakage of yarn, which is liable to occur were the frame started at full speed, is avoided.

Claim.—In combination with the fast and loose pulleys C E and the spindle-driving drum B of a machine for spinning yarn, mechanism substantially such as described, viz., the gears *a b s f*, clutch *g*, shafts *c d*, spring A, lever *i*, and notched projection *l*, combined and arranged as set forth, or its equivalent for running

the driving-drum B at a rate of speed less than that obtained by the said belt when run upon the fast pulley.

134,865.—*Lifting-Jack.*—S. SPENCER ECCLESTON, South New Berlin, N. Y.

The pawl may be operated from the rear end of the lever, however long said lever may be, thus allowing the lever to be made of any required length to obtain any desired leverage.

Claim.—The lever J, hinged to the under side of the lifting-lever C, and provided with the arm I adapted to enter a slot in the latter, the cord F, pulleys H G, pawl D, and standard B *b'*, all constructed, arranged, and operating as shown and described, for the purpose specified.

134,866.—*Printing-Telegraph Instrument.*—THOMAS A. EDISON, Newark, N. J.

In an instrument, when the type-wheel is arrested by a pin on its shaft coming in contact with a depressed key, and the pulsations are sent by a revolving motor or pulsator, the pulsator is stopped when the type wheel is stopped by a lever attached to the escapement armature-lever coming in contact with a pin on pulsator-shaft.

Claim.—1. The stop-arm *s*, connected with the lever *l* and pallets *k*, in combination with the pulsator *g*, and stop *f* for arresting the movement of the pulsator, substantially as set forth.

2. The type-wheel magnet A, in the circuit that is opened and closed by the pulsator *g*, in combination with a stop that arrests the movement of the pulsator when the circuit is broken, and a spring, or its equivalent, that liberates the pulsator upon completing the backward movement of the armature and pallets, substantially as set forth.

134,867.—*Automatic Telegraph Instrument.*—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C.

Neutralizes any earth or extra currents in automatic instruments by a weak constant local circuit, preventing "tailings" and blurs in the writing and the stylus being destroyed while inactive.

Claim.—1. The circuit from the battery *l* connected with the earth and line in a chemical telegraph instrument and adjusted by the rheostat *m* to neutralize earth currents, substantially as set forth.

2. The conductors *i i* connected with the battery *p*, in combination with the stylus *a* of a chemical receiving instrument, for the purposes and substantially as set forth.

134,868.—*Electro-Magnetic Adjuster.*—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C.

Armature-spring constant; power of magnet on armature adjusted by increasing or decreasing metallic connection between cores.

Claim.—The adjustable connection applied at the rear end of an electro-magnet, between the cores thereof, to vary the power of such electro-magnet, substantially as set forth.

134,869.—*Folding Feed-Box.*—JAMES L. EDWARDS, Cochranville, Pa.

Two sides fold on the bottom of the box, and the two remaining sides fold upon the first two. Spring-catches are arranged at the corners outside, and connecting leaves and hinges inside.

Claim.—1. In a feed-box, the sides B folding on the bottom of the box, and the sides C folding on the folded sides B, substantially as and for the purpose set forth.

2. The spring-bars G and catches H arranged with the ends of the sides C and faces of the sides B, as set forth.

3. The single leaves K, in combination with leaves J J, the latter being at right angles to each other and secured to adjacent sides of the box, as and for the purpose set forth.

4. The bottom D, swinging sides B C, leaves J K, spring-bars G, and catches H, combined and operating in the manner and for the purpose set forth.

134,870.—*Machine for Mining Coal.*—GEORGE ELBERO, Brasil, Ind.

The weighted lever holds the roller against the roof of the mine. The slots allow sufficient play to clear ordinary inequalities, and the crank J affords a means to clear greater. The rack *f*, moving with the piston, acts through a pinion, *k*, duplex pawl, and bevel and worm gearing, to impart a slow intermittent rotation to the feed-wheels *r r'*, embracing the rail; and these feed-wheels may be moved apart and upward by means of a screw, *s*, and inclines I I', to avoid frogs and cross-tracks.

Claim.—1. The described combination of automatic and hand operated devices E F G H I J K L M N O P Q R S, or their equivalents, for obtaining a continued upward stress or pressure, against an irregular roof or ceiling of a mine, substantially as set forth.

2. The devices *j j' h l m n o p p' q q' r r' s*, or their equivalents, for automatically shifting the apparatus to the right or left at the intervals of the strokes, substantially as set forth.

3. In combination with the elements *q q' r r' s*, the heads *t t'* and inclined planes I I', as and for the object explained.

4. The described combination of devices *h h' i o w v' w'* in a double-headed pick-stock, as set forth.

134,871.—*Screw-Cutting Machine.*—GEORGE EMIG, Cincinnati, Ohio.

The bolt-chuck connects with a graduated sliding rod on each side by means of lugs. On each side of the lugs, on the rods, adjustable collars are fixed, which determine the length of bolt to be threaded. The rods are connected by a cross-piece that operates a cone on the die-shaft, which closes and opens the dies as the bolt-chuck advances or recedes. An adjustable gage, through which the bolt may pass, is used to gage the length of bolt which is to project from the bolt-chuck.

Claim.—1. The bolt-chuck K, having two tappet arms, L and L', and the sliding cone E, in combination with the bar or cross-head G and a pair of graduated slide-rods, H and H', which are provided, respectively, with adjustable collars J J' and J'' J''', all substantially as and for the purpose specified.

2. The adjustable gage M *m*, in combination with the bolt-chuck K, and die-chuck C, the dies of which are opened and closed automatically by the bolt-chuck through intermediate mechanism, substantially as and for the purpose specified.

134,872.—*Process of Hardening Steel.*—SAMUEL W. ETCHELL, Weatherly, assignor to himself, D. L. EATON, same place, and ANNIE E. ALLEN, Philadelphia, Pa.

The tool or other object of steel is heated to a bright red, rolled in pulverized borax, and plunged in a mercury bath.

Claim.—The process of hardening steel by treating the same with borax, or its equivalent, and mercury, as set forth.

134,873.—*Carpet-Stretcher.*—LOUIS FANKHAUSER, Columbus, Ohio.

A series of sections arranged to screw together, and provided with a pivoted arm at one end having a toothed plate to engage with the carpet, and provided at the other end with an elastic head or buffer.

Claim.—The herein-described carpet-stretcher, consisting of a series of joints or sections arranged to screw together, and provided with the joint C, head B, and toothed plate *d*, as shown and described.

134,874.—*Hydraulic Main of Gas-Works.*—WILLIAM FARMER, New York, N. Y.

The main is cast lighter and the dip and stand pipes shorter.

Claim.—The hydraulic main provided with lateral cups or chambers for the insertion of the dip-pipes, substantially as set forth.

134,875.—*Folding Chair, Bed, and Ottoman Combined.*—EUGENE FAUH, New York, N. Y.

The ottoman is composed of three sections hinged together and provided with folding-legs and jointed braces. The head section has a hinged support provided with an extension frame. The head section can be raised to the desired inclination, and the foot section can be dropped to the floor.

Claim.—1. The combined bed, chair, and ottoman, composed of three sections, A, B, and C, folding-legs D D, jointed braces E, and support F, as set forth.

2. The head-rest support F and extension piece G, combined with hinged part C, as and for the purpose described.

134,876.—*Extract of Yucca.*—LOUIS G. FELLNER, Las Vegas, Territory of New Mexico.

Yucca-root is ground, steeped in water, and pressed. The liquid thus obtained is evaporated to the proper consistence for molding, when it is molded in forms and dried, then coated with varnish and packed in boxes.

Claim.—An extract of yucca-root prepared and put up, substantially as herein shown and described, to enable it to become an article of commerce.

134,877.—*Latch for Gates.*—JAMES R. FISLEY, Delphi, Ind.

Upon the gate is secured a horizontal bar, which projects beyond. Upon the post is secured a vertical plate or bar, to which is attached a metallic frame. The upper part of this frame extends horizontally outward from the post, and has a longitudinal slot in which is pivoted a drop latch or lever. The frame lies vertically along the post for a short distance below, equal to the width of the bar extending from the gate. The lower part of the frame curves outwardly and forms an inclined plane, up which the bar from the gate rides previous to being locked by the drop lever upon the horizontal part. The gate is thus made to lock automatically in such a way that cattle cannot open it by lifting a latch.

Claim.—The combination of the gate A with horizontal projecting bar D, and the gate-post C with the frame G and lever J, said frame being composed of the slotted horizontal part *a*, vertical part *b*, and curved part *d*, and the lever having its upper end *e* weighted and the lower end *f* wedge-shaped, all substantially as and for the purposes herein set forth.

134,878.—*Wheel-Plow.*—HARLOW M. FREEMAN, JOHN LOWE, and JOHN F. STEVENS, Lathrop, Mo.

Devices for equalizing the draft, and means of attaching the plows to the draft-equaliser.

Claim.—1. The combination of the rigid frame K M N and pivoted draft bars J, L, O, and P, with each other and with the tongue D of the machine, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the armed plate F, rod G, bent bar H, and short bar I, with the tongue D and pivoted draft bars J, L, O, and P, substantially as herein shown and described, for connecting the plow-beams E with said draft bars, as set forth.

134,879.—*Hot-Air Furnace.*—WILLIAM B. GEDDES, Rochester, N. Y.

Claim.—1. In a heater or furnace, a water-tank, J, arranged within the same and communicating with a ring, L, having apertures surrounding the fire-box, and also having communication with the outside of the heater for the purpose of supplying steam and air above the fire, substantially as herein set forth.

2. The inclined or elevated radial flues I I forming a communication between the interior and exterior chambers of a heater or furnace, substantially as and for the purposes herein set forth.

3. The interior heating-chamber G having inlets at the bottom, closed at the top, and radiating elevated flues I I to conduct the heated air from the same, substantially as and for the purposes herein set forth.

4. The combination of the interior heating chamber G, inclined flues I I, and the top cone E', substantially as and for the purposes herein set forth.

5. The heater or furnace composed of the shell B, fire-pot C, cones E, E', and E², cylinders G H, inclined flues I I, tanks J J', ring L, dome M, and chamber N with pipes O P, all constructed and arranged substantially as and for the purposes herein set forth.

134,880.—*Syrup Device for Soda-Fountains.*—WILLIAM GEE, New York, N. Y.

Within the syrup-measuring chamber is a stem having concentric and lateral valves, and connected with it at the bottom of the chamber is a general discharge-valve and a downward-discharge pipe formed with side perforations to spray the soda and mix it with the syrup when the latter is discharged into the chamber.

Claim.—1. The combination of the stem E and valves or valvular portions F, G, and H of the cock, with the syrup-measuring chamber C, the syrup-supply pipe B, the soda-water orifice *b*, and the general outlet A, essentially as and for the purposes herein set forth.

2. The perforated soda-water discharge-pipe I of the valve G, in combination with the syrup-measuring chamber C, substantially as specified.

134,881.—*Knitting-Machine.*—HUGO GÜNTHER, New York, N. Y., assignor to himself and CHARLES LUTPHIAN, same place.

The elevating and depressing cams are so far apart that the former operates only upon the turned-up heels of wires or "setting-needles," applied in an extension of the bed to raise the latched needles, while the depressing-cam acts upon the turned-up heel of the latched needles only to lower them, the heels of the latched needles being thus subjected to only half the usual wear.

Claim.—The combination, with latch and setting needles of a knitting-machine lock, composed of the cams A A and *i*, which are placed so far apart that the upper cams A A will depress the latch-needles while the lower cam *i* will elevate the setting-needles, substantially as herein shown and described.

134,882.—*Scroll-Saw.*—FRANK H. HARDENBERGH, Hawley, Pa.

The teeth are cut so as to be opposite each other, making in effect a saw with a double row of teeth.

Claim.—A saw-blade having two rows of teeth, *b b*, formed on it by oblique incisions longitudinally in opposite directions, as described and shown.

134,883.—*Paper-Ruling Machine.*—ALFRED HATHAWAY, Freetown, Mass.

When the friction-roll reaches the continuously-running feed-apron on the roller the revolution of the disk ceases. The paper is then introduced between the two, which feed it forward until its end presses back the lever and trips the detent of the friction-roll, which is then carried into its recess in the disk, which then revolves, its serrated sectors carrying forward the paper and its adjustable cams lifting the pen-bar at proper times. The roll is thrown out and relocked by a segment of the disk connected to it by a rod.

Claim.—The combination of one or more serrated sectors, K, the disk or wheel A and its cam or cams, stop-wheel, and the mechanism for operating and latching such stop-wheel, in manner as set forth.

134,884.—*Hand Corn-Planter.*—FRANK A. HAWKINS, Noblesville, Ind.

An oblong box; lower end smaller than the upper. In it a plunger, worked by hand, reciprocates vertically, effecting the revolution of the seed-cup disk by a strap passed round the drum of its spindle, having both ends attached to the plunger. The latter, at each down stroke, opens a spring-valve at the bottom and forces out the seed.

Claim.—The plunger B, operating against the inner side and one corner of the case A, and provided with the recesses K O, stops *c d*, and strap I, in combination with the drum H and feed-wheel J having stop-wires *e e*, all constructed and operated in the manner and for the purpose set forth.

134,885.—*Apparatus for Making Tuyeres for Bessemer Converters.*—ANDREW I. HAWS, Johnstown, Pa., and JAMES A. VAUGHAN, Cuyahoga Falls, Ohio; said VAUGHAN assignor to said HAWS.

Forming funnel at bottom of cylinder, in which hang rods depending from an interior block, for making the air-holes.

Claim.—1. The perforating-rods *e* depending from an open frame above the forming-neck D, substantially as specified.

2. The tuyere-former, consisting of the basin or funnel, forming-neck, depending rods, and check-plate, substantially as specified.

134,886.—*Pedal Attachment for Pianos.*—CHARLES W. HELD, Jr., and ALPHONSO M. SAUGH, Brooklyn, N. Y.

To enable a child to operate the pedal the foot-rest is extensible.

Claim.—1. The combination of the bar C, foot-rest H, pedals L, and rods N with a piano-forte, the said bar C being detachably connected, substantially in the manner described.

2. The foot rest H having an extension piece, H', substantially as specified.

134,887.—*Sad-Iron and Crimping-Shoe.*—JOHN HEWITT, New York, N. Y.

The crimping-shoe is made with a corrugated face and a projecting toe-piece and a vertical heel-bearing plate, which, through any suitable means, may be attached to a sad-iron temporarily so that, with the two, clothes may be ironed or crimped.

Claim.—The corrugated shoe-plate C having bearings D D', in combination with a sad-iron or polishing-iron, so as to permit of the smoothing-iron being converted into a fluting device, as and for the purpose specified.

134,888.—*Guide for Winding-Machines.*—DE WITT CLINTON HILL, Windham, Conn.

The glass guides have a notch in each side in which fit the wire conductors, by which they are held in place, the ends of the conductors being secured to plates which are adjustable on the traverse-bar, so that the distance apart of the guides may be varied.

Claim.—The glass thread-guides B B, constructed as described, in combination with the flexible wire conductors D D, the longitudinally adjustable or slotted plates C C, and the traverse bar A, substantially as specified.

134,889.—*Mechanism for Effecting Rotary Motion of Oil-Well Drills.*—GUSTAVUS A. HINCKLEY, Pit Hole, Pa.

An arrangement of levers, pawls, crown-wheel and pinion, and ratchet-wheel upon the end of a walking-beam, to rotate the drill-rope with the rise and fall of the beam through the medium of a rod attached to the samson-post.

Claim.—The lever *c*, the slider E with its projections *m m*, the connecting-rod *s*, and lever L, arranged and combined together and with the crown and ratchet wheels D K and their actuating-pawls *d d' g*, and also with the levers *q u*, all substantially as described and represented, the said lever *c* being connected with the lever *k* by the rod *g* and its arm *i*, arranged as shown.

134,890.—*Lubricating Compound.*—HENRY R. HUTCHINSON, Empire Iron Works, Ky.

Composition of tallow or oil, plumbago, sulphur, hydrated lime, animal charcoal, the whole ground in a mill until thoroughly mixed.

Claim.—A lubricating compound composed of the above-mentioned ingredients, combined and prepared substantially in the manner described.

134,891.—*Threshing-Machine.*—ARTHUR JOHNSTON, Lockport, N. Y.

Concave in sections, rear section adjusted by cam, pawl, and ratchet, front one by rods and set-screws. Adjustable rake in rear of concave, over first raddle.

Claim.—1. In a thrashing-machine, the combination, with a concave constructed in sections V V', of the adjusting devices, substantially as described, whereby one section is adjustable up and down bodily, and the other adjustable upon the pivot *r* for gaging the discharge-mouth, as herein set forth.

2. In combination with the concave formed of the two sections V V', the cams *u*, shaft *v*, and ratchet and pawl *w x*, for adjusting one section, and the screw-rods and wrenches X for adjusting the other, as herein shown and described.

3. The section V of the concave, provided with discharge-apertures made angular or inclined backward to prevent the breaking of the grain, as herein described.

4. In combination with the raddle D and with the thrashing-cylinder, the shaft *y* with angular fingers *z z*, and its adjusting-rod Z, and engaging ratchet a^2, arranged and operating as herein described.

5. In a thrashing-machine, the two three-slatted flies M N, one located in the space between the raddles and the other in the discharge-mouth of the machine, said flies being combined with the raddles, in the manner and for the purpose specified.

6. In a thrashing machine, in combination with the curved wings *i i* of the fan, the curved fine-plate S, arranged and operating as herein described.

7. In combination with the shoe T, the shaft *k*, gears 19 20 21 22, crank-heads *m*, and lugs *n* on one side, and the lugs *o q* and pendulous rods *p p* on the other, for giving a horizontal rotary motion to said shoe, as herein shown and described.

8. The combination of the hollow box O with the hinge arms P, constructed and arranged to operate as herein shown and described.

9. In combination with the coupling-ring A^2, branching ends f^2, and cross-bolts g^2 g^3, the flat springs A^3, and seat C^2, as herein shown and described, for the purpose specified.

134,892.—*Machine for Chamfering and Crozing Barrel-Staves.*—JOEL W. JONES, Middleport, Ohio.

The feeding-table is operated by a cam, with which it is connected by a series of levers and a cam-yoke.

Claim.—1. The vertically-adjustable shafts B C, actuating the feed-dash G and the feed-disks *w w*, substantially as herein shown and described.

2. The tilting stave feeder G hinged to the stave-bed, as and for the purpose described.

3. The means for tilting the feeder G, consisting of the strap *j*, the lever E, connection *i*, yoke-lever D *f*, and cam on shaft *h*, arranged substantially as described.

134,893.—*Spring-Coupling for Mattresses, Seats, &c.*—WILLIAM B. JUDSON, New York, N. Y.

A metallic plate or loop clasps the spring, the plate being proportioned to the diameter of the springs, and when it is desirable to separate the springs the plate is looped at each end.

Claim.—The combination, herein described, of helical springs of mattresses with a metal plate, A, of a width proportioned to the

diameter of the spring, and bent at its ends around the wires of the springs, substantially as and for the purpose specified.

134,894.—*Wheel for Vehicles.*—HIRAM KELLOGG, Floyd, Iowa.

Claim.—The means described for changing the position of spokes to suit any contraction or expansion in the fellies, consisting of the adjustable caps D and rings B a applied on the hub A, as set forth.

134,895.—*Folding-Crib.*—CHENEY KILBURN, Philadelphia, Pa., assignor to himself and JOEL H. GATES, same place.

In a crib with folding ends and bottom, braces or brackets are attached to the folding end, which serve to force the ends into their position and furnish a support for the hinged bottom.

Claim.—The metal stop-piece A constructed and adapted to the head or foot board and bottom of a folding-crib, substantially as described.

134,896.—*Bow for Chair-Back.*—CHENEY KILBURN, Philadelphia, Pa., assignor to himself and JOEL H. GATES, same place.

The back of the chair is constructed of two bent pieces, and firmly held by a coupling-block on its top or center.

Claim.—A bow for chair-backs, &c., composed of two or more bent strips of wood united by coupling-blocks, substantially as described.

134,897.—*Spectacles.*—JULIUS KNG, Warren, Ohio.

A steel spectacle-frame has the bridge or nose-piece made of silver.

Claim.—As an improvement in spectacles, the steel bows B B combined with bridge A of solid silver, or equivalent metal, to enable the soldering to be done at a lower temperature than where both are made of steel, to enable the steel to thereby remain uninjured by intensity of heat, and to produce a better and more durable article.

134,898.—*Tray or Show-Board.*—DANIEL H. KLOTZ, Philadelphia, Pa.

Spring-catches are attached to the tray, the main portions of which are at the back, and the holding portions on the face. A bracket or prop is attached to the back of the tray so that it may be held in an inclined position.

Claim.—1. A tray having one or more spring-catches, C, whose main portions are at the rear of the display-board or cushion B, and the holding portions or hooks *c* on the face thereof, and adapted and operating substantially as and for the purpose set forth.

2. The combination of the hinged bracket D E with a show-board constructed and operating as described.

134,899.—*Machine for Making Boot and Shoe Heels.*—ALBION KNOWLTON, Boston, Mass., assignor to JAMES W. BROOKS, trustee, same place.

Punches, graduating in size, are provided for cutting the heel-lifts, and are automatically brought in their proper order underneath a plunger and retained until charged with a lift or lifts, when moved forward until brought underneath stationary impaling-pins, upon which the lifts are forced. In this manner the requisite number of lifts, properly graded in size, are assembled and ready for permanent fastening.

Claim.—1. In combination with a vertically-moving die or plunger, a series of punches automatically brought in succession under the plunger, substantially as described.

2. In combination with an automatic vertically-moving die or plunger, a series of punches graded to cut lifts of variable size to form heel-blanks, substantially as described.

3. In combination with a series of lift-cutting punches moved under a vertical plunger, and mechanism for detaining each punch under the plunger, as described, the mechanism, substantially as described, by which the punch is released by the pressure of the lifts punched by it.

4. In combination with the mechanism for punching heel-lifts, as described, the mechanism, substantially as described, for automatically discharging the punched lifts.

5. In combination with the series of punches, the mechanism, substantially as described, that automatically discharges the lifts from each punch in succession and assembles the lifts from all the punches.

6. In combination with the mechanism described for assembling the lifts, the mechanism, substantially as described, for discharging the assembled lifts.

7. The combination of the mechanism described for punching heel-lifts, the mechanism, substantially as described, for assembling such punched heel-lifts, and the mechanism for fastening them together to form a heel or heel-blank.

134,900.—*Steam-Condenser.*—ERNST KORTING, Vienna, Austria.

An annular stream of cold water under high pressure acts on the principal of the Pelletan jet.

Claim.—1. In combination with the condenser, constructed and operating as described, the cock G communicating with the open air, as and for the purpose set forth.

2. The central spindle or nozzle E, when mounted within the water-nozzle D, and extended through into the condensing-nozzle C, as and for the purposes described.

3. The concentric nozzles E and L mounted within the water-nozzle D, one for water, and the other for fresh steam, when arranged substantially as described.

134,901.—*Threshing-Machine.*—DENNIS O. B. LADD, Racine, Wis., assignor to himself and P. E. MERRIHEW, Fair Haven, Mass.

Straw and grain thrown by threshing-cylinder upon chain-apron, which carries them into contact with revolving pickers working between guard-fingers. Grain and chaff then fall through fingers upon an incline, over which they are drawn by scrapers and delivered into the sieves. Straw and chaff blown over sieve by air-blast falling on shaking prongs. Unthrashed heads delivered from sieve into a lateral chute, from which they are feed to thrashing-table by elevator. Elevator and straw-carrier journaled onto the same shaft.

Claim.—1. The revolving fingers *g*, in combination with the detainer *k*, for the purposes set forth.

2. The incline *h*, perforated at the upper end, in combination with the chain *i* and scrapers *i*, substantially as specified.

3. The separating-fork *o*, receiving the straw, and to which a tossing movement is communicated, as set forth.

4. The shaft *u*, giving motion to the elevators, and also to the stacking apron or chain, substantially as set forth.

134,902.—*Corset.*—JOHN WILLIAM LANE, Bristol, assignor to EDWARD BRIMBLE, London, England.

To avoid ripping-out and sewing-in the corset-steel at every removal of the same, it is laced in, the laps inclosing the steels having for that purpose each a double row of eyelets.

Claim.—In a corset provided with steels at the front edge for clasping the two parts together, the eyelets formed in the extreme edge of the fabric and also back of the steel, the said two rows of eyelets corresponding to each other when the said extreme edge is turned over the steels, and the said turned-over edge secured by means of a lacing through the said two rows of eyelets, substantially as and for the purpose specified.

134,903.—*Wash-Stand.*—ALFRED H. LORTON, New York, N. Y.

A waste-tank having an arm-hole closed by means of a clamp, and provided with a pivoted pipe, cock, and vent-pipe, the whole arranged underneath a stationary basin and connected by suitable pipes.

Claim.—1. The waste-tank D, provided with the pivoted pipe F, and cock E', substantially as specified.

2. The waste-tank D, having an arm-hole closed by means of the clamp J and plate I, and rendered air and water tight by means of the diaphragm *i*, substantially as specified.

3. The vent-pipe L, in combination with the waste-tank D and basin B, substantially as specified.

134,904.—*Sewing Machine Table.*—HENRY LOTH, Philadelphia, Pa.

A hinged extension flap or leaf is attached to a sliding frame adapted to guides underneath the fixed top. When the frame is drawn out the flap may be turned over on top, forming a continuous table. When the frame is pushed in the flap folds down against the leg.

Claim.—The combination, substantially as described, with the fixed top D of a sewing-machine table, of a sliding frame, B, and an extension flap, A, hinged to the same.

134,905.—*Sewing Machine Table.*—HENRY LOTH, Philadelphia, Pa.

Drawers arranged to sliding rods are attached to the permanent top of the table. A leaf or flap is hinged to the same that may be turned over on top of the drawers to complete the table-top.

Claim.—The combination, substantially as described, of a sliding drawer or other receptacle or case, B, and a flap, D, hinged to the same, with the fixed top of a sewing-machine table.

134,906.—*Street Railway.*—THOMAS R. LOVETT, Philadelphia, Pa.

A street-rail, flat and flush with the surface, but having raised ribs alternating with spaces about three feet and two feet in length, respectively, the spaces of one rail being opposite the ribs of the other, so that one of each pair of grooved car-wheels is always in engagement with a rib. Object: To obviate the difficulty experienced by ordinary vehicles in leaving the tracks now in use, while serving the purpose of retaining upon the track the wheels adapted to run upon it.

Claim.—The flat rails A laid flush with the pavement and having alternate ribs B and spaces C, in combination with grooved wheels on the cars, the ribs and spaces of one side of the track alternating with those of the other, substantially as specified.

134,907.—*Fifth-Wheel for Carriages.*—HENRY A. LUTGENS, Paterson, N. J.

Claim.—The improved fifth-wheel, composed of the plate A, provided with sockets *a* and *d*, the flanges *p s*, the socket-arms *u g g*, and the head-block C, all formed or cast in one piece, in combination with the lower plate B, provided with the king-bolt socket *b*, and with the recesses and flanges cast therewith, as specified, all constructed, arranged, and operating as shown and described.

134,908.—*Apparatus for Filing and Binding Papers.*—PETER MAC VICAR, Philadelphia, Pa.

The clamps which hold the papers together through springs of unequal thickness, placed a short distance from the end of the box, and provided with screws to firmly hold the papers while being bound, and with apertures to facilitate the latter operation, can be removed from the box through its bottom and used for paper-file.

Claim.—1. The binding-bar A, arranged within the box, as described, so that the letters upon which the bar bears will project beyond both edges of the bar, for the purpose specified.

2. The combination, with the box, of the bar A and screws E, together detachable from the box, substantially as described.

3. The combination, with the binding bar or bars, of springs *b*, constructed and applied so as to depress the front edges of the bars, as specified.

4. The bars A A' with their springs and screws adapted to the box B so as to be entirely detachable, substantially as and for the purpose described.

5. The bar A, having binding-holes *i* and triangular slots *k*, arranged in respect to said holes as and for the purpose set forth.

134,909.—*Shirt.*—AUGUSTUS D. MARR, Boston, Mass., assignor to himself and JOHN H. C. MURSEY, same place.

The shirt-bosom is made of two or more fronts folded at the middle and opening like the leaves of a book, thereby capable of presenting several different bosoms.

Claim.—1. A folding shirt or garment front or facing, A, made or provided with one or more reversible flies, C D, to fold at the middle, and over and button from one side to the other of the front, all as and for the purpose set forth.

2. Two or more pieces, A' B' C', of cloth, arranged as shown in Fig. 3, and connected as described, so as to form a shirt or garment front or facing with one or more reversible flies, C D, to operate as and for the purpose explained.

134,910.—*Press for Cheese, Fruit, &c.*—BENJAMIN G. MARTIN, New York, N. Y., assignor to himself and E. RICHARD EDMOND, same place.

Consists in actuating the follower by toggle-levers pivoted upon travelers, which are moved toward and from each other by one or more screws driven by a crank. When the toggle-levers have exhausted their stroke the screw is reversed and the slide moved up the central standard, its pawls engaging ratchet-teeth on the same, whereby a new leverage is imparted to the toggle-levers for a second additional pressure on the follower, the vertical standard always retaining the follower in its depressed position, during such operation, by the pawls *o* engaging the sleeve K and screw-shaft G.

Claim.—1. The combination of a sleeve, H, pawls *g*, and ratchet-teeth *h*, with the central standard of the follower F, and with toggle-levers I J, travelers *i i'*, and a screw or screws, *l l'*, substantially in the manner herein shown and described.

2. The combination of a slide, K or K', ratchet teeth *n* or *n'*, and pawls *o* or *o'*, with the central standard of the follower F, toggle-levers I J, travelers *i i'*, and a screw or screws, *l l'*, substantially in the manner set forth.

3. The combination of a fixed screw-rod, *l*, and a revolving tubular screw-rod, *l'*, with travelers *i i'*, toggle levers I J, and follower F, substantially as shown and described.

4. The concave perforated bottom plate *f* on the follower F in combination with a perforated cup, E, substantially as shown and described.

5. The press-box D, constructed of two semi-cylindrical sections, *a b*, the section *a* being connected to the bed-plate A by a hinge-joint, *e*, substantially in the manner herein shown and described.

6. The screw G', combined with the central standard of the follower F, and with the slide K' fitted in the head-block C, substantially in the manner and for the purpose set forth.

134,911.—*Water-Proof Wall.*—HERMANN MATTFELD, New York, N. Y., assignor of one-half his right to ISAAC COLEMAN, same place.

Claim.—The herein-described mode of constructing water-proof cellars, floors, and walls, viz: A double wall whose interior space contains the overlapping plates of glass or equivalent non-porous material with cemented edges, said space being afterward filled with grouting or Portland cement, substantially as described.

134,912.—*Grocer's Sample-Case.*—N. BARKER MCCREARY, Phelps City, Mo.

The box has a glass cover that slides in grooves, and is held in place by a catch at one end. Near one end of the box is an inclined plate for holding a card.

Claim.—The combination of the box A, glass top B, and inclined plate C with each other, substantially as herein shown and described.

134,913.—*Steam-Plow.*—ALBERT E. MCGAUGHEY, East Minneapolis, Minn.

The spider carrying the plows rotates in a horizontal plane, and as it rotates the pinions revolve on the fixed crown-wheel. The pinions engage with the shaft G, to which the plows are attached, by means of spring-clamps, in such manner that each plow is stationary and in position to cut a furrow for about one-third of the revolution of the spider, when it rises by the revolution of the shaft G and the next plow comes into work. The plowing is thus accomplished in a series of curved furrows cutting across the line of progress of the machine.

Claim.—1. The rotary spider F carrying the plow or plows H on the rotating axle or axles G, as specified.

2. The shaft G carrying the plow H and combined with the pinion *a* and spring *b*, as set forth.

3. The click *c* arranged in combination with the spider F, shaft G, and plow H, as set forth.

4. A plow rotating around a vertical and horizontal axis, substantially as set forth.

5. The shafts E and G arranged in combination with the plows H, as set forth.

134,914.—*Feather-Renovator.*—EDGAR N. MCKIMM and JOHN R. GEARHART, Lathrop, Mo.

The detachable stirrers are fastened to the inner revolving beating-drum by means of fixed and hinged loops.

Claim.—The stirrers of a feather-renovator, combined with loops *d* at one end, and hinged concave clamp *d'* at the other, as and for the purpose described.

134,915.—*Self-Acting Spinning-Mule.*—AARON METCALF and WILLIAM GIBBONS, Preston, Great Britain.

The pendulous rod and the rack on its lower end are moved so as to raise the nut in the radial arm during the going out of the carriage, by being impinged against by an arm suspended from the fellies, the position of this arm, and consequently the extent to which the pendulous rod is moved, being governed by the tension of the yarn.

Claim.—1. In combination with the vibratory arm, feed-screw, and nut and chain of a spinning-mule, a swinging or pendulous rod connected with said arm, screw-nut, and chain, as described, so as to turn the screw and elevate the nut with the "going out" of the mule carriage, provided too much tension exists upon the yarn, and to allow the screw and nut to remain motionless upon return or "going in" of said carriage, essentially as and for purposes stated.

2. The pendulous rod C suspended from the arm *b*, as stated, and provided at the bottom with a suitable sectoral rack or its equivalent, for operating, through the agency of intervening mechanism, the feed-screw G, essentially in the manner and for the purposes stated.

3. In combination with the rod C and nut H, an adjustable stop for determining the comparative drop of such rod with the inward dip of the vibratory arm *b*, substantially as stated.

134,916.—*Spring-Vehicle.*—JOHN M. MILLER, Cincinnati, Ohio.

Claim.—The combination of the transverse springs L L', spring-bars J J', lower spring-bars or reaches C C', axle A, and bolster B, all constructed and arranged to operate as and for the purposes specified.

134,917.—*Fishing-Reel.*—GEORGE MOONEY, Providence, R. I., assignor to himself and JAMES SHAW, Jr., same place.

Besides the improved reel gearing, two curved jaws hinged together at the base of the reel-frame clasp the rod, and are set or loosed by a screw-ring.

Claim.—1. The combination of a reel mounted in a suitable frame, and provided with a pinion secured to its axis, a crank-pin provided with a pinion rigidly attached thereto, and a rotating crank-plate revolving on an axial line common to the reel, and carrying the crank-pin and its pinion, substantially as described, whereby the reel may be operatively revolved at a speed greater than that at which the crank-plate is revolved, and also whereby the motion of the reel may be reversed without consequent movement of the crank-plate, as and for the purposes specified.

2. The combination of the reel, rotary crank-plate, crank-pin, connecting-pinions, and the stop *k*, whereby the reel and crank-pin may be united and rotated at the same rate of speed, and possess no capability of movement in either which shall be independent of the other, as and for the purposes specified.

3. The combination, with the reel, of the semicircular jaws and the rotating cam-plate, substantially as described, whereby the jaws are made to securely compress a rod when interposed between them, as and for the purposes specified.

134,918.—*Device for Aiding Cutting Goods on Bias.*—GYORG MOORE, Scotch Plains, N. J., assignor to MARGARET MOORE, same place.

A drafting-triangle is graduated for bias measurement, and has its long side provided with sharp points for holding in position the goods upon which the instrument is pressed, as a guide for the cutter.

Claim.—The device for bias-cutting described, having the frame A B C provided with the points *d d'*, and having the bar A adapted to serve as a guide for placing it in position, as herein specified.

134,919.—*Device for Marking Goods on Bias.*—GEORGE MOORE, Scotch Plains, N. J., assignor to MARGARET MOORE, same place.

An ordinary open triangle is graduated for bias measurement, and has the outer ends of its arms connected by a chalk-line.

Claim.—The within-described bias-marking device having a chalk line, C, connecting the right-angled arms A and B, one of which is graduated for bias measurements, and the whole adapted to serve on a piece of goods in the manner herein specified.

134,920.—*Machine for Making Baskets.*—JAMES MOORE and SAMUEL W. DAY, Oak Creek, Wis.

On a platform or floor is secured a center support on which rests the foundation for the device on which the material for the baskets is placed. Hinged to the sides of the foundation or platform are blocks, which, when turned up, serve to form the basket, and hold in position the sides for securing the upper edge of the splints, after which a splint or band of the same material is passed around its top and held firmly by clamps, to be secured by nails or rivets to its edge.

Claim.—1. The table B provided with flaps or equivalent slides *b'*, the form C, bar D, lever F, rope and weight H J, and pivoted locking-bar K, in combination with each other, substantially as herein shown and described, and for the purpose set forth.

2. The form L provided with the iron band N and screw-clamps O, in combination with the bar D, form C, and table B *b'*, substantially as herein shown and described, and for the purpose set forth.

134,921.—*Horse-Cover.*—ALONZO H. MORRIS, Boston, Mass.

The blanket is cut to fit the horse's body and limbs.

Claim.—The protector cut and shaped substantially as shown and described, the same being adapted for covering the body and limbs of the animal.

134,922.—*Pruning-Shears.*—AMOS R. MOULTON, Fall's Branch, Tenn.

The end of one of the levers or blades is hooked or turned inward. Upon a pin, just below the curved part, an obliquely-slid-

ing cutter moves, being guided by a curved slot. Upon the end of the other lever is secured one end of the sliding cutter, which is provided with a series of holes for adjustment. Two short braces, placed upon either side, confine more closely the working-parts and prevent displacement.

Claim.—The combination of the hooked lever A, lever B, and obliquely-sliding cutter E, provided with an elongated slot, G^2, for the passage of the guide bolt or pin H and formed with a series of holes, G, or slot, for adjusting the same vertically upon its fulcrum-bolt F, as herein shown and described.

134,923.—*Soldering-Iron.*—JAMES D. NORTON, St. Louis, Mo.

Claim.—The internally-threaded copper A having threaded shank, the end-threaded shank B, the sleeve-screw C, and the nut D, all combined, constructed, and arranged as and for the purpose described.

134,924.—*Railroad-Rail Joint.*—SOLOMON NUNAMAKER, Nineveh, Pa.

The fish-plate on one side of the rail is concavo-convex in form, and on the other side has vertical ribs upon its inner face, both constructions being designed to secure elasticity.

Claim.—1. The improved rail-splice and nut lock, consisting of the concavo-convex elastic fish-plate D′ and the ribbed elastic fish-plate D, substantially as specified.

2. The ribbed elastic fish-plate D, constructed and applied substantially as specified.

134,925.—*Sash-Holder.*—DANIEL PIKE, New Orleans, La., assignor of one-half his right to CHRISTOPHER SATTERLY, same place.

A wedge-shaped bar, having a longitudinal slot, passes over a pin or pivot fastened to the inside of the sash, and through which it is capable of either vertical movement or of rotary motion. Within the slot a coiled spring is fastened, one end being attached to the pin and the other to the upper end of the bar, thus securing upward pressure to hold the sash automatically in elevated position. A thumb-piece is attached to the upper end of the bar, and a notch is cut upon the side of the bar to receive a holding-pin when in reverse position. There is also a recess or indentation in the side of the window-frame to receive the upper end of the bar when it has been thrown around, thus allowing the sash to be firmly locked in position.

Claim.—The slotted bar A, having the notch a^2 and inclosing the spring C, in combination with the pins a^1 and *b*, as shown and described, and the recess or indentation G, for the purpose specified.

134,926.—*Apparatus for Manufacturing Window-Glass.*—WILLIAM W. PILKINGTON, St. Helens, England.

A combination of mechanisms for facilitating the operations of the "blower," viz: First, supporting the blower's tube and the glass attached thereto; second, aiding the glass-blower to impart the necessary swinging motion; third, imparting rotary motion to the tube and glass by mechanical agency; and fourth, effecting the blowing by compressed air—the above operations being simultaneously performed.

Claim.—1. The carriage-frame *f*, wheels *d*, and anti canting wheel *e*, in combination with the cross-shaft *g* and glass-blower's tube *i*, all adapted to serve on rails at the side of the swing-hole, as herein specified.

2. The combination of the provisions *m*, *l*, *n*, *o*, *p*, *q*, and *q′*, with the glass-blower's tube *i*, so mounted and arranged on the carriage-frame *f* and wheels *d* as to allow of the swinging and revolving motion, as specified.

3. The combination of the ducts r r^2 and their connections, and valve r^3 for blowing and controlling the blowing action, with the tube *i*, carriage *f*, and provisions for allowing the tube to be rotated on the said carriage, as herein specified.

4. The combination of mechanisms for facilitating the several operations in the manufacture of glass, of supporting, swinging, rotating, and blowing, arranged and constructed substantially as herein described.

134,927.—*Lift and Force Pump.*—ASHTON H. POWELL, Philadelphia, Pa., assignor to himself, JOSEPH WOOD, Red Bank, N. J., and EDWIN R. BENNAT, New York, N. Y.

Closing the bore of the body of the pump at the upper end and inserting a tube or lining in the latter; passing the bucket-rod through a stuffing-box and arranging the discharge-pipe at some distance below the closed end, thus converting that portion of the box within the tube into an air-chamber.

Claim.—1. The combination of the wooden case A, lining or tube *i* extending to the discharge-pipe and closed at the top, and bucket-rod extending through a stuffing-box at the top of the tube.

2. The cap or plate *f*, lining *i*, and bucket-rod *a*, connected together and adapted to and detachable from the case A, as set forth.

134,928.—*Grain-Register.*—JACOB S. PRICE, Champaign county, and PETER MILLER, Clarke county, Ohio.

A reciprocating double-slide gate or cut-off is arranged below a receiving-hopper, so that when pressed forward the grain will fall through an opening in its upper slide into the measuring-chamber closed at the bottom by the lower slide, and when drawn backward the upper slide will be closed while the grain in the chamber falls through an opening in the lower slide. A counting-register, tripped by the reciprocating movement of the alternating cut-off, indicates the quantity passed.

Claim.—The combination and arrangement of shields *f*, slides *e* and *e′*, hopper A, and grain-receptacle B, as and for the purposes hereinbefore set forth.

134,929.—*Car-Wheel.*—ROBERT RAMSAY, Irwin's Station, Pa.

Upon an annular chamber within the hub are arranged projections of peculiar form, each having a funnel-shaped orifice through its center for the admission of oil. These projections will carry the oil above and allow it to drip upon the journal.

Claim.—1. The combination of the annular oil-chamber *b* and the nipples *d d d* provided with orifices for the introduction of oil, and arranged as described for that purpose, each constructed substantially as and for the purpose described.

2. The combination of the nipples *d d d* having the outer form, and the orifices *e e e* of the peculiar form described, and the arrangement described with reference to the length of the chamber *b* and the said oil-chamber itself, substantially in the manner shown and described, and for the purpose set forth.

3. The nipples *d d d*, having the peculiar outer form and interior orifice *e*, substantially as shown and described, for the purpose set forth.

134,930.—*Truck for Moving Buildings.*—THOMAS J. REAMY, Tarborough, N. C.

Claim.—The roller B provided with the ratchet E and located in the pivoted frame A, in combination with the lever F and double pawl G, substantially as and for the purpose specified.

134,931.—*Mold for Casting Metal Knobs.*—CHRISTIAN REBSTOCK and JOSEPH OTTNER, Bridgeport, Conn.

A mold so constructed as to receive a bush. Also an eyelet, and a removable ring, by which the two parts of the shell are separated.

Claim.—1. A mold for casting knobs, so constructed that a bushing-tube around the spindle and an eyelet for bushing the fastening-screw hole may be set, substantially as shown and described.

2. In combination with a mold for casting knobs, the removable ring E, substantially as and for the purposes described.

134,932.—*Vise.*—IRVIN ROBERTS, Meriden, Ill., assignor of one-half his right to JOHN T. BREARLEY, same place.

The jaw A′ is operated by the foot-treadle F and toggle-joint levers G, forcing its lower end either in or out.

Claim.—In combination, the rigid jaw A attached to the part B, the headed bar C supporting the movable jaw A′ and constituting its fulcrum, the brace E and treadle F pivoted thereto, the toggle G pivoted to the lower end of the jaw A′ and connected to the treadle, all constructed and arranged together substantially as shown and described, and for the purposes specified.

134,933.—*Heel-Stiffener.*—ICHABOD R. ROGERS, Lynn, Mass., assignor to himself, JOHN WOOLDRIDGE, and GEORGE E. BARTLETT, same place.

Thin inferior leather is made serviceable for heel-stiffeners by inserting between the leather and cloth lining a metallic spring, shaped to impart to the stiffener the requisite form and rigidity in the direction of its length.

Claim.—A heel-stiffener having the narrow spring *c* inserted between the lining *b* and outer piece *a*; said spring being fastened in position substantially as described.

134,934.—*Car-Brake.*—ALBION M. ROUSE, South St. Louis, assignor of one-half his right to CASHIER AMSLAR, St. Louis, Mo.

A shaft is arranged between the trucks, either vertically or horizontally, which is provided with an arm at either end, and is allowed play in one of its bearings so that it will adapt itself to the power applied and both brake-shoes will be equally applied, regardless of their difference in thickness. A lever, fulcrumed at its center to the car, answers as an equalizer.

Claim.—The combination, as herein specified, of equalizing-lever E, pulleys G, rope or chain H, levers I, crank-shafts J M, slotted bearings L, and connecting-rods *m* for applying and equalizing the pressure on the two brakes of a pair of trucks, and on the two brake-bars of each, as herein set forth.

134,935.—*Apparatus for Dyeing and Washing Fibrous Materials.*—CHARLES G. SARGENT, Graniteville, Mass.

Claim.—1. The lifting-rake S, arranged at the foot of the inclined chute J, as and for the purposes set forth.

2. The inclined chute J, provided with the fixed inclined teeth or projections P, substantially as shown and described.

3. The pivoted weighted teeth M, mounted in slots in the chute J, substantially as shown and described.

4. The curved chute J, in combination with the swinging carrier-rake W, for conveying the fiber toward the squeezing-rolls.

5. The rake-lever *p*, having its upper end mounted in the sleeve L and provided with the nuts *t*, and its middle provided with the shoulder *q*, in combination with the sleeve *m* attached to crank *k*, as shown and described.

6. The carrier-rake W, in combination with the curved chute J having fixed inclined teeth, the stirring-rake F, and the squeezing-rolls I.

7. The combination of the stirring-rake F, lifting-rake S, chute J, carrier-rake W, and squeezing-rolls I.

8. The conveying-rolls *y*, having their surfaces arranged to travel at different rates of speed, as and for the purpose set forth.

9. The tank or receptacle Y, arranged below the chute, between the main tank or bowl and the squeezing-rolls, as and for the purpose set forth.

10. The rakes F and W, having the sleeves which support their upper ends made adjustable laterally, as described.

134,936.—*Fluting-Machine.*—DAVID R. SAUNDERS, Houston, Tex.

Has a corrugated bed-plate, upon which works a correspondingly-corrugated roller with a handle. Bed-plate has a gage attached to the ends by screws, said gage regulating the width of the fluted part.

Claim.—1. In combination with a plate fluting or crimping machine, the gage A, substantially as described.

2. The bed B, roller E, gage A, and handle D, constructed, combined, and arranged substantially as described, for the purposes set forth.

134,937.—*Refrigerator.*—JOHN GEORGE SELTZER and ANDREW JACKSON FINK, Reading, Pa.

The inside of the ice-box and the outside of the ice-rack incline in opposite directions so as to form a sufficient space for the free circulation of air. The refrigerator is also divided into two or more compartments, and have apertures through the partitions for the passage of air from one to the other, the air being regulated by means of valves arranged within said partition.

Claim.—1. The combination, with the cage having inclined sides, of the box A, the sides of which are inclined in an opposite direction from those of the cage, as set forth.

2. The combination, substantially as described, of the said ice-box and cage with the drip-catcher D and the apertures *a*, *a′*, &c., by which communication is established between the said ice-box and a series of provision-chambers.

3. The adjoining provision-chambers B, B′, &c., communicating with each other at the bottom through openings provided with valves or slides *g*.

4. The combination, substantially as described, of the inlet and outlet pipes J and L with the elevated ice-box A, its cage K, the deflecting drip-catcher D, and communicating provision-chambers B.

134,938.—*Machine for Making Brass Kettles and other Hollow Ware.*—FREDERICK J. SEYMOUR, Wolcottville, Conn.

The tool *i* spins up the article in the former, while tool *o* acts against *a* and reduces and smooths the metal.

Claim.—The tools *i* and *o*, in combination with the revolving form *a*, for reducing a sheet-metal blank into a kettle or hollow article, substantially as set forth.

134,939.—*Spinning Articles of Sheet Metal.*—FREDERICK J. SEYMOUR, Wolcottville, Conn., assignor to himself, ACHILLE F. MIGEON, same place, and FRANKLIN FARRELL, Ansonia, Conn.

The sheet of metal is heated in a furnace and clamped in the machine if sufficiently thick to retain the heat during the operation; otherwise, a jet of gas and atmosphere in combustion may be directed upon the blank.

Claim.—1. The method of spinning hollow articles of sheet-iron or similar metal by the action of the spinning mechanism upon the sheet of metal in a heated state, substantially as set forth.

2. The combination of spinning mechanism, substantially as specified, with means for directing upon the revolving blank of sheet metal a blast of artificial heat or flame, substantially as set forth.

3. A kettle or other hollow article made of one piece of sheet iron or steel, shaped and reduced to a proper thickness by a rolling operation, the same forming a new article of manufacture.

4. A revolving form or mold and a spinning tool or roller mounted in a spring or yielding bearing so as to spin the metal to the shape of the mold, in combination with a roller or tool acting against the first roller or tool to spread the metal and prevent wrinkles and inequalities, substantially as set forth.

134,940.—*Piano-Forte Action.*—JOHN SHAUDELLE, Huntsville, Ala.

Claim.—An India-rubber hammer-head for pianos, provided with an opening near its tip or striking-surface, as described.

134,941.—*Bleaching-Safe.*—CATHERINE W. SHIVELEY, Peru, Ind.

A chest provided with a series of drawers having slotted drawers to admit of the free circulation of the sulphurous acid through them, and pegs for support of the hats or bonnets.

Claim.—The combination of the bleaching-safe, A, and a series of perforated drawers, F, for the support of the goods to be bleached, substantially as specified.

134,942.—*Corn-Planter.*—ALGERNON D. SMITH, Cincinnati, Ohio.

The invention consists in a rubber stop and holder, to lessen the jar.

Claim.—A new article of manufacture, the compressible and elastic stop D *d* F or F′ G, for attachment to a hand corn-planter, as set forth.

134,943.—*Expanding Rock-Drill for Shaft-Boring Apparatus.*—HUGO SONTAG, St. Louis, Mo.

When the apparatus reaches the lower end of the casing the bit is forced out by the spring. Its movement is regulated by the screw.

Claim.—The combination of the horizontally-sliding bit L, cross-bar O, spring P, and set-screw R, constructed and operated as and for the purpose set forth.

134,944.—*Cam for Operating Valves for Steam-Engines.*—EDWIN SPRAGUE, Allegheny, Pa.

The ordinary axis of motion of the common full-stroke cam is arranged eccentric to the axis of the crank-shaft of the steam-engine, so that it will be rotated around the axis of the crank-shaft, thereby imparting to the cam-rod and its yoke a continuous motion.

Claim.—The hereinbefore-described method of tripping "cut-off gear" of steam-engines by the ordinary full-stroke cam, so that its axis of motion shall be eccentric to its ordinary axis of motion, whereby it will perform the function of the full-stroke cam, and also trip said "cut-off gear" by a single cam-rod and cam-yoke, as and in the manner set forth.

134,945.—*Hub for Vehicles.*—SYLVESTER T. F. STERICK, Georgetown, D. C., assignor to WILLIAM M. KING.

Claim.—1. A back cap, B, secured to the inner end of the axle-box, and concealing from view the nuts *n n*, substantially as described.

2. The metallic disks H K connected by the double inclined faces of the projections L L, in combination with the back cap B provided with lugs I I, which abut against the concealed nuts *n n*, substantially as described.

3. The perforated cap P provided with the interior cylindrical bearing Q, for surrounding the axle-box and supporting the spoke-disk K, as and for the purpose set forth.

4. The combination of the perforated cap P provided with the bearing Q for the axle-box, and the octagonal-shaped nut R screwed on the exterior of the axle-box, whereby the parts are bound securely together, and compensation may be made for the wear of the parts, as set forth.

5. The nut and hub-band S formed in one piece, in combination with the nut R and cap P, substantially as described.

6. The combination of the axle-box A, back cap B provided with lugs I I, metallic disks H K connected by projections L L, conical cap P having the cylindrical bearing Q for the axle-box, octagonal nut R, and combined nut and hub-band S, substantially as set forth.

134,946.—*Two-Horse Evener.*—JAMES STURGIS, Minneapolis, Minn.

The double-tree is allowed to move, and the chains turn the plate or wheel, which carries the rear end of the chain of the forward horse nearer in line with the center of draft, while the end of the chain of the rear horse is carried further out of line.

Claim.—The combination of the pivoted plate E, pulleys D, chains G, double-tree F, and whiffletrees H, when arranged to operate substantially as described.

134,947.—*Can for Packing and Transporting Paints, &c.*—HIRAM TUCKER, Newton, Mass.

The can is stood upon its base, and the plunger forced down, causing the contents to be discharged only so fast as the plunger is forced down.

Claim.—1. A can for holding and transporting paints or semi-solid substances, provided with a follower or plunger to force the material from the can, substantially as shown and described.

2. In a can having a plunger, a cap, *c*, provided with a central orifice, *f*, for reaching the plunger without removing the cap of the can.

3. In combination with the fixed head, a nut applied in or to such head to receive the screw which operates the plunger.

4. A can headed at top and at bottom, and having inclosed a solid plunger fitting the sides at all points, the stem of the plunger working through a central opening in the head, substantially as shown and described.

5. In combination with a can constructed substantially as described, a press adapted to be used therewith, substantially as set forth.

134,948.—*Manufacture of Horseshoe-Nails.*—DAVID TURNAYNE and GEORGE M. WYMAN, Boston, Mass., assignors to GLOBE NAIL COMPANY, same place.

Between two pairs of rolls is situated a conveyer-plate having a tapered groove with flaring sides, over which is swung a gate held by a spring. A stoppage occurring in the conveyer, from any irregularity in the form of a nail, will cause the accumulating blanks to press against the gate, forcing it open, and releasing a spring-trigger, projecting from above, that intercepts the flow of blanks.

Claim.—1. The nail-guiding plate, having the gate held by a spring or other device, and arranged to be opened by pressure of accumulating blanks, substantially as described.

2. The nail-plate, having a passage formed with the flaring sides *e* for pressing the accumulating blanks against the gate, substantially as described.

3. In combination with the gate, the hook or intercepter *r* operating substantially as shown and described.

134,949.—*Cultivator.*—GEORGE WAGGONER, New Kingston, Pa.

The tongue and frame are both articulated on the axle, so that either the frame or tongue may be raised and the two connected in that position by a rod.

Claim.—The combination of the tongue H, axle A, frame B E, bar J, shoulder M, and slotted plate L, all arranged as and for the purpose specified.

134,950.—*Truck for Moving Buildings.*—WILLIAM E. WALKER, Albion, Iowa.

The motive power is applied independently of the trucks.

Claim.—The braces I J, when combined and arranged, as described, with the axle B, sand-board C having curved slot, bolster D, and king-bolt E, so that the bolster is thus re-enforced and strengthened without being prevented from turning in the sand-board.

134,951.—*Rock-Drilling Machine.*—FRANK WALTS, Watertown, N. Y.

The notch in the staple retains the link until the plate has made nearly half a revolution, and then, releasing it, allows the drill to fall. The springs compensate for the cessation of the lifting-strain.

Claim.—The combination of the pivoted double-acting cam H provided with ball L and notches O O, slide I, spring K, and chain or rope N, all substantially as set forth.

134,952.—*Spool-Holder.*—LEWIS F. WARD, Marathon, N. Y.

The spool-holder is a circular disk revolving upon a support. The disk has a series of slots around its outer edge, in which the spools are placed and held securely by elastic cords passing under and above them. An opening passes from the edge of the disk to the slot, through which the thread is drawn.

Claim.—The within-described spool-holder, consisting of the revolving disk B mounted upon a suitable support, and provided with the slots C and elastic strips D, substantially as and for the purpose described.

134,953.—*Ejecting Apparatus for Bottles.*—WILLIAM S. WARD, New York, N. Y.

A small force-pump is arranged within a perfumery or other bottle, and having a hollow piston-rod passing through the stopper and terminating at the upper end in a small cup, so constructed that by pressing down the piston-rod a quantity of the fluid in the bottle will be ejected.

Claim.—1. The hollow piston-rod having a concave push-piece, F, attached to the upper end, substantially as specified.

2. The combination of the spring G with the pump-cylinder and piston-rod of an ejecting attachment for bottles, substantially as specified.

134,954.—*Pitman-Connection for Harvesters.*—BENJAMIN F. WATERS, Garrettsville, Ohio, assignor to F. W. ANDREWS, Titusville, Pa.

The lip C is caused to overhang the head, and thereby effectually to prevent the displacement of the pitman when at work.

Claim.—The pitman or pitman-coupling piece A, constructed substantially as described, whereby it is adapted to be held in joint with the sickle-head without aid of removable parts, as set forth.

134,955.—*Bushing for Piston-Rods, &c.*—GEORGE W. WELCH, Fort Wayne, Ind.

A bushing with a tapering recess and shoulder, in which is placed the packing, is adjusted by a gland.

Claim.—The adjustable bushing A, provided with the tapering recess *b* and shoulder *d* for the packing *z*, in combination with the gland D, all constructed and arranged as herein shown and described.

134,956.—*Cloth-Steaming Machine.*—CHARLES H. WESTON, Lowell, Mass.

The face side of the cloth passes over the steam-cylinder and box, and the cold-water tank rests against the back of the cloth and condenses the steam rising through the cloth.

Claim.—A cold-water tank in a steaming-machine, in combination with a steaming apparatus, when so arranged that the cloth is kept cool upon one side while being steamed upon the other, as is herein fully set forth.

134,957.—*Brake-Clutch for Hoisting Apparatus.*—THOMAS A. WESTON, Ridgewood, N. J.

Clutches a pulley-wheel or other driver to and releases it from a shaft.

Claim.—1. The combination of a friction-wheel, B, on a shaft, a loose pulley, D, a friction-band, G, the lever E, and knee-joint arms arranged to operate the said lever, all substantially as described.

2. The end of the friction-band G and its projection *p*, in combination with the key K and its wedge-shaped rib *t*, the whole being adapted to the rim of the pulley D, substantially as set forth.

134,958.—*Brake-Clutch for Hoisting-Machines.*—THOMAS A. WESTON, Ridgewood, N. J.

When the weight has to be lowered, all that is necessary is to retard or turn back the driving-wheel, when the wheel D will be free from the control of the friction-band and the barrel will be at liberty to revolve freely on the shaft, or it may be retarded to any extent desired by the manipulation of the driving-wheel.

Claim.—1. In a clutch-brake, the combination of a friction-wheel and a friction-band with a lever, E, through the medium of which the band is controlled, substantially in the manner described.

2. The combination of the driving-wheel H and its curved slot *h*, the lever E and its pin or slot *n*, adapted to the said slot, the friction-band G, wheel D, and barrel A.

3. A spring, *g*, forming the inner edge of the slot *h* in the driving-wheel, as and for the purpose specified.

134,959.—*Compound for Destroying Caterpillars.*—GREEN F. WHITEHART, Chapel Hill, Tex.

Paris green, arsenic, lime, and flour.

Claim.—The compound of Paris green, arsenic, lime, and flour, herein described, for the purpose set forth.

134,960.—*Brake for Spinning-Mules.*—JOHN W. WHITEHEAD, Saco, Me.

The pulley on the side of the carriage passes, at the end of each traverse, under one of the springs so that it may be gradually brought to a stand, and a rebound avoided.

Claim.—The combination of the pulley *e* on the mule-carriage with the springs d d, substantially as described, and for the purpose mentioned.

134,961.—*Sewing-Machine.*—JOHN H. WHITNEY, Rochester, Minn.

The disk and hook are in this instance applied to the upper end of the rotary reciprocating looper-shaft of a Grover & Baker sewing-machine. The hook carries the needle-thread around the bobbin and forms a lock-stitch.

Claim.—1. The hook or looper a having the V-shaped groove in its front edge, and provided with the rearwardly-curved lip *b*, by which the thread is depressed and passed under and around the bobbin, as set forth.

2. The combination of the reciprocating needle C and rotating lip a with the bobbin-holder H, bobbin J, disk G, and rim *c*, all constructed and arranged to operate substantially as set forth.

134,962.—*Coin-Counting Implement.*—AMOS WHITTEMORE, Cambridgeport, Mass.

A shovel is provided with a compact series of shallow recesses adapted to the size of the coin to be counted, so that when filled by being passed under a loose pile a determinate number will be transferred to a tilting chute, and thus deposited in the appropriate receptacle.

Claim.—1. The shovel or plate C provided with a handle, C^1, and constructed with circular depressions *b*, the bottoms of which are perforated, substantially as set forth.

2. The combination, with such counter, of a trough, A, and pivoted chute C^2, substantially as described.

134,963.—*Nut and Bolt Fastening.*—EDWARD B. WINGATE, Friendship, N. Y.

One end of the pivoted dog projects from the top of the nut, and serves to disengage the teeth of the dog, which are held in place by a spring from the nut-seat to allow the nut to be unscrewed.

Claim.—A screw-nut, D, having a pivoted dog, E, arranged in a vertical recess, *v*, so as to engage with the seat of the nut, and constructed and operating substantially as herein described.

REISSUE PATENTS.

5,229.—*Cotton-Gin Saw.*—THOMAS C. CRAVEN, Northampton, Mass., assignor to BARTON H. JENKS, Philadelphia, Pa.—Patent No. 115,441, dated May 30, 1871.

The cotton-gin saw is corrugated in any desired lines by dies.

Claim.—1. A saw for cotton-gins, stiffened or straightened by corrugating, as and for the purpose set forth.

2. A corrugated cotton-gin saw as a new article of manufacture.

5,230.—*Process of Manufacturing Hard Rubber.*—AUSTIN G. DAY, New York, N. Y.—Patent No. 21,121, dated August 10, 1858; reissue No. 620, dated November 9, 1858; extended seven years.—Division A.

Claim.—1. Running the heat for vulcanizing flexible and elastic hard-gum compounds through the high range of temperature and the comparatively great length of time, substantially as set forth—that is to say, commencing the heat at about 275° and carrying the same to 300° and upwards, substantially as described.

2. Making, as described, the flexible and elastic hard-gum composition of two parts by weight of rubber or other vulcanizable gum and one part of sulphur, when such composition is preparatory to the running of the heat, as described in these specifications.

5,231.—*Manufacture of Hard Flexible Rubber.*—AUSTIN G. DAY, New York, N. Y.—Patent No. 21,122, dated August 10, 1858; reissue No. 620, dated November 9, 1858; extended seven years.—Division B.

Claim.—1. The herein-described special process of producing vulcanized hard compounds which possess the properties of flexibility and elasticity, as set forth, by vulcanizing in any suitable apparatus a mixture composed of two parts, by weight, of India rubber or other vulcanizable gum, and one part, by weight, of sulphur, at a temperature commenced at or about 275° Fahrenheit and carried to the degrees of temperature hereinabove mentioned, substantially in the manner and with the result herein described.

2. A heater or vulcanizing apparatus in which the temperature is equalized, substantially in the manner and for the purpose set forth.

5,232.—*Hard-Rubber.*—AUSTIN G. DAY, New York, N. Y.—Patent No. 21,123, dated August 10, 1858; reissue No. 620, dated November 9, 1858; extended seven years.—Division C.

Claim.—The herein-described special product formed by vulcanizing in any suitable apparatus a mixture of two parts, by weight, of India rubber or other vulcanizable gum, and one part, by weight, of sulphur at a temperature commenced at or about 275° and carried to the degrees of temperature hereinabove mentioned, so that such product shall possess the properties of flexibility and elasticity, substantially as described.

5,233.—*Stalk-Cutter.*—THOMAS A. GALT and GEORGE S. TRACY, Sterling, Ill.—Patent No. 121,353, dated November 28, 1871.

The implement is provided with supporting-wheels G G hung on pivoted curved levers *g*, by which the implement, when desired, may be supported with its cutters free from the ground.

Claim.—In a corn-stalk cutter having the cutting-reels C and the transverse beams or stop-bars *z*, the lever *g* pivoted between the stop-bars *z* and bearing at the ends of the lower arms the carrying-wheels G, substantially as specified.

5,234.—*Umbrella Frame, Runner, and Notch.*—ABRAM HERZBERG, Philadelphia, Pa., assignee of half interest to ISAAC HERZBERG. Patent No. 132,563, dated October 12, 1872.

Claim.—1. An umbrella in which the enlarged ends of the ribs or stretchers are connected to the notches or runners by projections on the latter bent partly round the said enlarged ends, substantially as set forth.

2. An umbrella notch or runner, consisting of a tube having at one end bent radial projections, as specified.

5,235.—*Whip-Socket.*—CHARLES B. MOREHOUSE, Newcastle, Ind., assignor, by mesne assignments, to EDWIN CHAMBERLIN and JOHN O. MERRIAM.—Patent No. 43,858, dated August 16, 1864.

Claim.—A clamp or fastening device consisting of the jaw B, in combination with the movable bar or cap B for the purpose of fastening a whip socket to the dash-rod D or other suitable part of a vehicle.

5,236.—*Machine for Cutting Of Lead-Pencils.*—PHILIP SCHWAG and PHILIP HUFELAND, New York, N. Y., assignors to EBERHARD FABER.—Patent No. 103,241, dated May 17, 1870.

No saws or files are required, the wood of the pencils is not liable to split, and the grinding-surface of the drum can be readily renewed at comparatively small expense.

Claim.—1. The combination of a moving grinding-surface, A, with a clamp, E, made to retain a series of pencils, and with a clamp-supporting rail, substantially in the manner and for the purpose specified.

2. A pencil-retaining clamp, provided with shoulders *d d'*, one of said shoulders being in advance of the other, in combination with a guide-rail and a moving grinding-surface, substantially as set forth.

3. The jacket or box C, inclosing the cutting-drum A, in combination with a pencil-retaining clamp, and with a tube, F, for connecting with an exhaust fan, substantially as and for the purpose described.

5,237.—*Carriage-Wheel.*—SIMON VREELAND, Pottstown, Pa., assignor, by mesne assignments, to METALLIC SUSPENSION-WHEEL COMPANY.—Patent No. 92,915, dated July 20, 1869.

Claim.—1. The combination, substantially as described, of the metal spokes, enlarged at their opposite ends, with the metal felly and hub.

2. The severed ring *d*, adapted to a collar on the axle, in combination with the box B, its cylinder C, and nut D, as set forth.

3. The spokes having threaded ends, in combination with the felly having openings through which the said ends of the spokes pass, and with nuts adapted to the interior of the felly and securing the same to the spokes, substantially as described.

5,238.—*Auger.*—BLASE WALCH, Frederick, Md.—Patent No. 111,099, dated January 17, 1871.

Claim.—1. An independent circumferential cutter, D, adjustable as and for the purpose described.

2. The combination, with an auger, A, of two cutters, C D, relatively constructed and arranged to operate as and for the purpose described.

INDEX OF INVENTIONS PATENTED JANUARY 14, 1873.

[The numbers in parenthesis denote the classification of patents.]

Auger, (29,) B. Walch, (reissue) 5,238
Auger, earth, (51,) Collins and Morrison 134,734
Axle box and spindle, (31,) J. Bower 134,725
Axle blanks, tool for finishing, (60,) H. E. Forrest 134,742
Barrel staves, machine for chamfering and crozing, (40,) J. W. Jones 134,892
Baskets, machine for making, (109,) Moore and Day 134,930
Bed bottom, (62,) A. H. Bell 134,839
Bedstead, sofa, (62,) J. Brada 134,843
Bedsteads, crib attachment for, (62,) E. F. Bryan 134,847
Boiler, steam, (148,) H. Camp 134,784
Boilers, sediment collector and blow-off for steam, (128,) Leonard and Hancock 134,811
Boiler attachment, wash, (136,) S. B. Hartman 134,800
Boot and shoe heels, machine for making, (16,) A. Knowlton 134,899
Bottles, ejecting apparatus for, (1,) W. S. Ward 134,953
Box, match, (90,) C. Paddock 134,764
Bracelet, (86,) T. L. Cornell 134,735
Brush, paint, (22,) J. J. Gorman 134,745
Butter worker, (45,) D. W. Dake 134,788
Can stopper, oil, (107,) L. R. Boyd 134,842
Can for preserving fruits, &c., (58,) W. H. Hammond 134,799
Can for packing and transporting paints, &c., (107,) H. Tucker 134,947
Cans, metallic bottom for milk, (136,) T. M. Bell 134,733
Cans, sheet for forming the bodies of square or rectangular tin, (136,) J. Bowers 134,736
Car brake, (122,) A. M. Ronse 134,934
Car starter, (122,) L. D. Benner 134,840
Car wheel, (122,) R. Ramsay 134,929
Car truck, railroad, (122,) P. G. Gardiner 134,743
Car axle box, railway, (122,) C. W. Harvey 134,691
Carpet stretcher, (62,) L. Fankhauser 134,873
Carriage, child's, (31,) J. A. Crandall 134,856
Carriage curtain, (31,) H. Donnell 134,682
Carriage wheel, (31,) S. Vreeland, (reissue) 5,237
Carriage springs, clip plate for, (31,) N. C. Dean 134,859
Case, grocer's sample, (54,) N. B. McCreary 134,912
Caster stand, (88,) G. D. Dudley 134,726
Caterpillars, compound for destroying, (96,) G. F. Whisenant 134,959
Chair, (62,) L. H. Baker 134,834
Chair, tip, (62,) B. A. Carlan 134,850
Chair foot rest, (62,) E. Collins 134,733
Chair, bed and ottoman, combined, folding, (62,) E. Faak 134,875
Chair back, bow for, (62,) C. Kilburn 134,894
Cigar bunches, machine for pressing, (100,) G. Pierce 134,768
Cloth cutting machine, (37,) I. Fenno 134,783
Cloth steaming machine, (37,) C. H. Weston 134,956
Clothes drier, (91,) D. E. Watson 134,898
Clothes lines, sliding support for, (91,) M. Bubser 134,849
Coal boring machine, (124,) S. Hipkins, Jr 134,804
Coal, &c., bit for boring, (124,) S. Hipkins, Jr 134,805
Coal, machine for mining, (124,) G. Elbrog 134,870
Coffee, treating damaged, (58,) F. Evans 134,791, 134,792
Coin counting implement, (42,) A. Whittemore 134,962
Composition for coating metal pipes, roofing, &c., (126,) J. Specht 134,922
Corn sheller, cob carrier for, (38) H. H. Eby 134,789
Corset, (80,) J. W. Lane 134,902
Crib, folding, (62,) C. Kilburn 134,895
Cultivator, (43,) S. S. Bushnell 134,728
Cultivator, (114,) I. N. Canthorn 134,732
Cultivator, (43,) A. C. Tower 134,894
Cultivator, (114,) G. Waggoner 134,949
Curtain cord rack, (62,) W. D. Ludlow 134,819
Cylinder, steam drying, (48,) W. C. Collier 134,786
Dredger, (92,) R. G. Packard 134,817
Drill for shaft boring, apparatus, expanding rock, (124,) H. Seatag 134,943
Drills, machine for effecting rotary motion of oil well, (124,) G. A. Hinckley 134,889
Drilling machine, rock, (124,) F. Watts 134,951
Dyeing and washing fibrous material, apparatus for, (11,) C. G. Sargent 134,935
Electro magnetic adjuster, (50,) T. A. Edison 134,866
Elevator, water, (118,) A. Balding 134,835
Engine, hydraulic, (118,) J. C. Hodges 134,806
Engines, flue blast for steam fire, (12,) J. Grabner 134,796
Engines, cam for operating valves of steam, (150,) E. Sprague 134,944
Evener, two horse, (31,) J. Sturgis 134,946
Fan, rotary, (165,) I. S. Eastman 134,740
Feather renovator, (62,) McKlum and Gearhart 134,914
Feed box, folding, (144,) J. L. Edwards 134,869
Feed regulator for calender rolls, (168,) M. Lawler 134,810
Fifth wheel for carriages, (31,) H. A. Luttgens 134,907
File, paper, (146,) G. W. Billow 134,734
Fishing reel, (143,) G. Mooney 134,917
Flower pots, bracket for, (62,) M. D. Jones 134,751
Fluting machine, (38,) D. R. Saunders 134,936
Furnace, hot air, (154,) W. B. Geddes 134,879
Furnace for roasting and treating ores, (99,) Z. A. Willard 134,782
Gage, (22,) J. W. Butler 134,729
Gas works, hydraulic mains of, (66,) W. Farmer 134,874
Gear, friction driving, (67,) W. W. Tunis 134,895
Generator, tubular steam, (148,) J. M. Hicks 134,803
Glass, pot for melting, (68,) J. Dougherty 134,789
Glass, apparatus for manufacturing window, (68,) W. W. Pilkington 134,905
Goods on bias, marking, (97,) G. Moore 134,919
Goods on bias, aiding cutting, (97,) G. Moore 134,918
Grain register, (42,) Price and Miller 134,928
Grates, casting fire, (33,) H. Anshutz 134,838
Gun sight, (55,) Schottky and Simendinger 134,772
Harvester rake, (74,) T. P. Barbour 134,788
Harvesters, pitman connection for, (74,) B. F. Waters 134,954
Heater, base burning fire place, (154,) J. S. Perry 134,767
Heating apparatus for ranges, hot water, (147,) H. L. Palmer 134,765
Heel stiffener, (16,) L. C. Crowell 134,730
Heel stiffener, (16,) I. R. Rogers 134,933
Hoisting apparatus, brake clutch for, (79,) T. A. Weston 134,957
Hoisting machines, brake clutch for, (79, T. A. Weston 134,958
Holder, spool, (38,) L. F. Ward 134,952
Horse cover, (72,) A. H. Morris 134,921
Horseshoe nail machine, (60,) A. D. Bingham 134,841
Horseshoe nails, manufacture of, (60,) Turbayne and Wyman 134,948
Hub for vehicles, (31,) S. T. F. Sterick 134,945
Inhaler, (156,) W. R. Crumb 134,859
Inhaler, medical, (156,) M. L. Donaldson 134,861
Inkstand, (146,) S. W. Baldwin 134,836
Jack, lifting, (79,) S. S. Eccleston 134,865
Jam nut, rubber, (14,) W. Todd 134,953
Kettles and other hollow ware, machine for making brass, (136,) F. J. Seymour 134,938
Knitting machine, (89,) H. Gunther 134,881
Latch for gates, (93,) J. R. Finley 134,877
Lamps, &c., indicating filler for, (90,) J. A. Ryan 134,819
Leather punch and cutter, (72,) H. S. Fickett 134,794
Locomotive fire box, (94,) C. H. Farley 134,741
Loom shuttle, (95,) H. H. Bryant 134,848
Looms, shuttle guide for, (95,) J. B. Bancroft 134,837
Lounge, (62,) F. Krater 134,752
Lubricating compound, (87,) H. R. Hutchinson 134,890
Mattresses, seats, &c., spring coupling for, (62,) W. B. Judson 134,893
Mechanical movement, (67,) W. Park 134,766
Medical compound, (98,) J. Andrews 134,721
Medical compound, (98,) T. Morley 134,762
Medical compound, (98,) H. J. Klnts 134,893
Mold for casting metal knobs, (33,) Robstock and Ottaer 134,931
Mop head, (32,) W. Duncan 134,739
Mortising machine, (173,) C. Muschar 134,915
Mowing machine knife grinder, (74,) M. W. Knox 134,899

Nail distributing machine, (103,) C. M. Chase 134,852
Needle case, (32,) G. Wempe 134,829
Nut lock, (14,) A. Williams 134,781
Nut and bolt fastening, (14,) E. B. Wingate 134,963
Offal, apparatus for treating, (96,) W. L. Bradley 134,844
Oil wells, hanger for walking beams for, (124,) Hulings and Innis 134,807
Organ, reed, (106,) R. E. Letton 134,754
Organ, reed, (105,) G. Woods 134,830
Painting, oil, (54,) J. C. Walker 134,827
Paper sizing, (103,) P. Grady 134,797
Paper ruling machine, (15,) A. Hathaway 134,883
Papers, apparatus for filing and binding, (146,) P. Mac Vicar 134,908
Pencils, machine for cutting off lead, (174,) Schrag and Hufeland, (reissue) 5,236
Piano forte action, (112,) J. Schandelle 134,940
Pianos, pedal attachment for, (112,) Held and Baugh 134,866
Pianos, music desk for, (112,) M. Doherty 134,860
Piston rods, &c., bushings for, (15,) G. W. Welch 134,955
Planter, corn, (133,) G. D. Haworth 134,747
Planter, corn, (133,) A. D. Smith 134,942
Planter, hand corn, (133,) F. A. Hawkins 134,884
Planter and seeder, combined corn, (133,) R. Cowan 134,855
Plow, steam, (114,) A. E. McGaughey 134,913
Plow, wheel, (114,) Freeman, Lowe and Stevens 134,878
Potato bug collector, (63,) J. Corbell 134,854
Press for cheese, fruit, &c., (45,) B. G. Martin 134,910
Pruning shears, (62,) A. R. Moulton 134,922
Pulley, band, (67,) E. P. West 134,778
Pump, (118,) F. Candal 134,785
Pump, reaction, (118,) E. Rhodes, Jr. 134,770
Pump, steam, (118,) J. W. Handren 134,746
Pump, lift and force, (118,) A. H. Powell 134,927
Purifier, middlings, (57,) C. Janney 134,750
Railroad rail, (120,) W. S. Hunter 134,749
Railroad rail joint, (120,) S. Nunamaker 134,924
Railway, street, (130,) T. R. Lovett 134,906
Reapers and mowers, heel for knives for, (74,) R. Allstater 134,831
Refrigerator, (58,) Seltzer and Fink 134,937
Row lock, (13,) J. M. K. Southwick 134,821
Rubber, hard, (84,) A. G. Day, (reissue) 5,232
Rubber, manufacture of hard flexible, (84,) A. G. Day, (reissue) 5,231
Rubber, manufacturing hard, (84,) A. G. Day, (reissue) 5,230
Ruler, parallel, (97,) W. B. Mason 134,814
Seal iron and crimping shoe, (91,) J. Hewitt 134,887
Safe, bleaching, (11,) C. W. Shiveley 134,941
Sash fastener, (94,) T. P. I. Magoun 134,813
Sash holder, (94,) W. B. Bradford 134,727
Sash holder, (94,) D. Pike 134,925
Saw, jig, (131) B. Merritt 134,760
Saw mill, (130,) W. Gowen 134,795
Saw, scroll, (134,) F. H. Hardenbergh 134,882
Saw, cotton gin, (41,) T. C. Craven, (reissue) 5,229
Sawing lathe, machine for, (174,) S. P. Brower 134,846
Scaffold, (50,) J. F. Darley 134,737
Screw, wood, (171,) Bidwell and Chisholm 134,783
Screw cutting die, (14,) W. E. Ward 134,777
Screw cutting machine, (14,) G. Emig 134,871
Screws, die for capping, (171,) G. W. Briggs 134,845
Screws, machine for slotting the heads of, (171,) Pierce and Ayres 134,818
Scythe, (40,) E. L. Wheeler 134,779
Sewing machine, (134,) J. H. Whitney 134,961
Sewing machine table, (134,) J. B. McClure 134,759
Sewing machine table, (134,) H. Loth 134,904, 134,905
Sewing machines, attachment for, (134,) F. N. Vlolet 134,826
Sewing machines, treadle for, (134,) A. B. Shaw 134,820
Sewing machines, ruffling attachment for, (134,) H. C. Goodrich 134,744
Sewing machines, mechanism for operating, (134,) D. Whitlock 134,780
Shawl strap, (102,) J. B. Higgins 134,748
Shell, cutting and shaping pearl, E. Carrington 134,851
Shingles, machine for bundling, (174,) R. Law 134,753
Shirt, (36,) A. D. Marr 134,909
Shoe, &c., fastening for, (16,) G. Merrill 134,761
Shoe binding stripe, device for fastening the ends of, (16,) C. E. Morrill 134,763
Slate dressing machine, (153,) F. Shenton 134,773
Slotting and key seat machine, (100,) J. H. Cranston 134,857
Soda fountains, syrup device for, (1,) W. Gee 134,880
Soldering iron, (138,) J. D. Norton 134,923
Spectacle, (157,) J. King 134,897
Spinning frame, (142,) G. Draper 134,864
Spinning mule, self-acting, (142,) Metcalf and Gibbons 134,915
Spinning mules, brake for, (142,) J. W. Whitehead 134,960
Spinning machines, spindle for, (142,) D. H. Rice 134,771
Spinning articles of sheet metal, (136,) F. J. Seymour 134,939
Spinning frames, spindle bolster and step for, (142,) G. Draper 134,863
Stalk cutter, (73,) Galt and Tracy, (reissue) 5,233
Steam condenser, (148,) E. Korting 134,900
Steam and air brake, (122,) Smith and Ogden 134,774
Steel, process of hardening, (85,) S. W. Etchell 134,872
Tag, (146,) T. P. Marston 134,757
Tag fastener, (146,) T. P. Marston 134,756
Tag fastening, (146,) J. S. Loughery 134,755
Telegraph instrument, printing, (36,) T. A. Edison 134,866
Telegraph repeater, duplex, (50,) J. B. Stearns 134,776
Telegraphic instrument, automatic, (39,) T. A. Edison 134,867
Thrashing machine, (159,) A. Johnston 134,891
Thrashing machine, (159, D. O. B. Ladd 134,901
Tongs, griping, (136,) W. J. Hallefas 134,798
Transplanter, (63,) Stanton and Pedrick 134,775
Trap, fly, (143,) S. B. Bacheller 134,833
Tray or show board, (54,) D. H. Klotz 134,898
Truck for moving buildings, (31,) T. J. Reamy 134,930
Truck for moving buildings, (31,) W. E. Walker 134,940
Tuyeres for Bessemer converters, apparatus for making, (12,) Haws and Vaughan 134,825
Umbrella frame, runner, and notch, (165,) A. Hersberg, (reissue) 5,234
Valve, balanced slide, (152,) T. Beesley 134,838
Vehicle, spring, (31,) J. M. Miller 134,916
Vehicle spring, (31,) E. Cliff 134,853
Vehicle wheel, (31,) H. Kellogg 134,894
Vessels, propelling, (139,) H. C. Camp 134,730
Vise, (29,) L. Roberts 134,932
Wall, water proof, (4,) H. Mattfeld 134,911
Wash stand, (8,) A. H. Lorton 134,903
Washing machine, (91,) E. Norton 134,816
Washing machine, (91,) E. Potts 134,769
Watch maker's lathe, (36,) R. Cowles 134,787
Water wheel, (168,) J. T. Case 134,731
Whiffletree, (31,) C. B. McClymond 134,758
Whip socket, (72,) C. B. Morehouse, (reissue) 5,235
Whip stock, (72,) L. Heywood 134,802
Winding machines, guide for, (17,) D. C. Hill 134,888
Yucca, extract of, (98,) L. G. Fellner 134,876

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 14, 1873.

Allen, A. E., assignee 134,872
Allstatter, R., Heel for knives for reapers and mowers 134,831
Amsler, C., assignee 134,934
Andrews, F. W., assignee 134,954
Andrews, J., Medical compound 134,721
Anshutz, H., Casting fire grates 134,832
Ayres and Pierce 134,818
Bacheller, S. B., Fly trap 134,833
Baker, E. L., assignee 134,852
Baker, L. H., Chair 134,834
Balding, A., Water elevator 134,815
Baldwin, S. W., Inkstand 134,806
Bancroft, J. B., Shuttle guide for looms 134,837
Barbour, T. P., Harvester rake 134,722
Bartlett, G. E., assignee 134,933
Baugh and Held 134,866
Beesley, T., Balanced slide valve 134,838
Bell, A. H., Bed bottom 134,839
Bell, T. M., Metallic bottom for milk cans 134,783
Benner, L. D., Car starter 134,840
Bennett, E. R., assignee 134,927
Bidwell, J. A., and W. Chisholm, Wood screw 134,783
Billow, G. W., Paper file 134,724
Bingham, A. D., Horseshoe nail machine 134,841
Bliss, S. S., assignee 134,859
Boothby, H., assignee 134,742
Bower, J., Axle box and spindle 134,725
Bqwers, J., Sheet for forming the bodies of square or rectangular tin cans 134,726
Boyd, L. R., Oil can stopper 134,842
Brada, J., Sofa bedstead 134,843
Bradford, W. B., Sash holder 134,727
Bradley, W. L., apparatus for treating offal 134,844
Brearley, J. T., assignee 134,832
Briggs, G. W., Die for capping screws 134,845
Brimble, E., assignee 134,902
Brooks, J. W., trustee 134,899
Brower, S. P., Machine for sawing laths 134,846
Brown, D., assignee 134,774
Bruen, L. P., assignee 134,722
Bryan, F. F., Crib attachment for bedsteads 134,847
Bryant, H. H., Loom shuttle 134,848
Bubser, M., Sliding support for clothes lines 134,849
Bushnell, S. S., Cultivator 134,728
Butler, J. W., Gage 134,729
Camp, H., Steam boiler 134,784
Camp, H. C., Propelling vessels 134,730
Carlan, B. A., Tip chair 134,850
Carrington, E., Cutting and shaping pearl shells 134,851
Case, J. T., Water wheel 134,731
Catudal, F., Pump 134,785
Cauthorn, I. N., Cultivator 134,732
Chamberlin, E., assignee, (reissue) 5,235
Chase, C. M., Nail distributing machine 134,852
Chisholm and Bidwell 134,783
Cliff, E., Vehicle spring 134,853
Cochrane, J., assignee 134,797
Coleman, L., assignee 134,911
Collier, W. C., Steam drying cylinder 134,786
Collins, E., Foot rest for chairs 134,733
Collins, G. G., and J. A. Morrison, Earth auger 134,734
Corbell, J., Potato bug collector 134,854
Cornell, T. L., Bracelet 134,735
Cowan, R., Combined corn planter and seeder 134,675
Cowles, R., Watch maker's lathe 134,787
Crandall, J. A., Child's carriage 134,856
Cranston, J. H., Slotting and key seat machine 134,857
Craven, T. C., Cotton gin saw, (reissue) 5,229

Crowell, L. C., Heel stiffener 134,736
Crumb, W. R., Inhaler 134,858
Dake, D. W., Butter worker 134,788
Darley, J. F., Scaffold 134,737
Day, A. G., Manufacturing hard rubber, (reissue) 5,230
Day, A. G., Manufacturing hard flexible rubber, (reissue) 5,231
Day, A. G., Hard rubber, (reissue) 5,232
Day and Moore 134,920
Dean, N. C., Clip plate for carriage springs 134,859
Dillingham, E. and N., assignees 134,738
Doherty, M., Music desk for pianos 134,860
Donaldson, M. L., Medical inhaler 134,861
Donnell, H., Carriage curtain 134,862
Dougherty, J., Pot for melting glass 134,789
Draper, G., Spindle bolster and step for spinning frames 134,863
Draper, G., Spinning frame 134,864
Dudley, G. D., Caster stand 134,738
Duncan, W., Mop head 134,739
Eastman, I. S., Rotary fan 134,740
Eaton, D. L., assignee 134,872
Eby, H. H., Cob carrier for corn shellers 134,790
Eccleston, S. S., Lifting jack 134,865
Edison, T. A., Printing telegraph instrument 134,866
Edison, T. A., Automatic telegraphic instrument 134,867
Edison, T. A., Electro magnetic adjuster 134,868
Edwards, J. L., Folding feed box 134,869
Elbreg, G., Machine for mining coal 134,870
Emig, G., Screw cutting machine 134,871
Esmond, E. R., assignee 134,910
Etchell, S. W., Hardening steel 134,872
Evans, F., Treating damaged coffee 134,791, 134,792
Faber, E., assignee, (reissue) 5,236
Fankhauser, L., Carpet stretcher 134,873
Farley, C. H., Locomotive fire box 134,741
Farmer, W., Hydraulic main of gas works 134,874
Farrell, F., assignee 134,930
Faub, E., Folding chair, bed, and ottoman combined 134,875
Fellner, L. G., Extract of yucca 134,876
Fenno, I., Cloth cutting machine 134,793
Fickett, H. S., Leather punch and cutter 134,794
Fink and Seltzer 134,937
Finley, J. R., Latch for gates 134,877
Forrest, H. E., Tool for finishing axle blanks 134,742
Freeman, H. M., J. Lowe and J. F. Stevens, Wheel plow 134,878
Galt, T. A., and G. S. Tracy, Stalk cutter, (reissue) 5,233
Gardiner, P. G., Railroad car truck 134,743
Gates, J. H., assignee 134,695, 134,696
Gearhart and McKimm 134,914
Geddes, W. B., Hot air furnace 134,879
Gee, W., Syrup device for soda fountains 134,880
Gibbons and Metcalf 134,915
Globe Nail Company, assignee 134,948
Goodrich, H. C., Sewing machine ruffling attachment 134,744
Gorman, J. J., Paint brush 134,745
Gowen, W., Saw mill 134,795
Grabuer, J., Flue blast for steam fire engines 134,796
Grady, P., Paper sizing 134,797
Greenleaf, O. S., assignee 134,810
Gunther, H., Knitting machine 134,881
Hallefas, W. J., Griping tongs 134,798
Hammond, W. H., Can for preserving fruits, &c 134,799
Hancock and Leonard 134,811
Handren, J. W., Steam pump 134,746
Hardenbergh, C. M., assignee 134,750
Hardenbergh, F. H., Scroll saw 134,882
Harrington, G., assignee 134,867, 134,868
Hartman, S. B., Wash boiler attachment 134,800
Harvey, C. W., Railway car axle box 134,801
Hathaway, A., Paper ruling machine 134,883
Hawkins, F. A., Hand corn planter 134,884
Haworth, G. D. Corn planter 134,747
Haws, A., and J. A. Vaughan, Apparatus for making tuyeres for Bessemer converters 134,825
Heatherington, R., assignee 134,804, 134,805
Held, C. W., Jr., and A. M. Baugh, Pedal attachment for pianos 134,886
Hersberg, A., Umbrella frame, runner, and notch, (reissue) 5,234
Hewitt, J., Sad iron and crimping shoe 134,887
Heywood, L., Whip stock 134,802
Hicks, J. M., Tubular steam generator 134,803
Higgins, J. B., Shawl strap 134,748
Hill, D. C., Guide for winding machine 134,888
Hinckley, G. A., Mechanism for effecting rotary motion of oil well drills 134,889
Hipkins, S., Jr., Coal boring machine 134,804
Hipkins, S., Jr., Bit for boring coal, &c 134,805
Hodges, J. C., Hydraulic engines 134,806
Hufeland and Schrag, (reissue) 5,236
Hulings, M., and W. J. Innis, Hanger for walking beams for oil wells 134,807
Hunter, W. S., Railroad rail 134,749
Hutchinson, H. R., Lubricating compound 134,890
Innis and Hulings 134,807
Ives, J. A., & Brother, assignees 134,726
Janney, C., Middlings purifier 134,750
Jenks, B. H., assignee, (reissue) 5,229
Johnston, A., Threshing machine 134,891
Jones, J. W., Machine for chamfering and crozing barrel staves 134,892
Jones, M. D., Bracket for flower pots 134,751
Judson, W. B., Spring coupling for mattresses, seats, &c 134,893
Kellogg, H., Wheel for vehicles 134,894

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. But as volumes per year (an issue takes place every Tuesday) were found to fill up the shelves of the libraries so fast as to [illegible] the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office, and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

ANNUAL REPORT

OF

THE COMMISSIONER OF PATENTS

FOR THE YEAR 1872.

To the Senate and House of Representatives of the United States of America in Congress assembled:

In compliance with Section 9 of Patent Law, I submit the following as my annual report for the year ending December 31, 1872.

1. *Statement of moneys received.*

Amount received on applications for patents, reissues, extensions, caveats, disclaimers, appeals, and trade-marks	$616,865 00
Amount received for copies of specifications, drawings, and other papers	67,198 00
Amount received for recording assignments	15,735 30
Total	699,798 30

2. *Statement of moneys expended.*

Amount paid for salaries		$445,375 02
Amount paid for photo-lithographing current issues, (6 mos.)		16,366 31
Amount paid for illustrations for Gazette		26,618 43
Amount paid for photographing back issues		61,908 21
Amount paid for contingent and miscellaneous expenses, viz:		
Advertising	$4,029 07	
Stationery	17,033 37	
Tracings, &c	2,096 53	
Painting, glazing, varnishing, paper-hanging, &c	2,302 46	
File-boxes	112 00	
Furniture, carpeting, &c	12,900 39	
Fitting up cases in model-rooms, carpenter's work, and repairing furniture	20,680 41	
Plumbing and gas-fitting	1,703 56	
English patents	792 95	
Work on report and indexes	1,600 00	
Refunding money paid by mistake	795 00	
Hardware	838 50	
Pay of temporary employees	38,278 54	
Miscellaneous items, viz: Books for library, subscriptions to journals, freight, ice, washing towels, awnings, fees of judges in appeal cases, withdrawals, repairing carriage and harness, and keeping horse	11,512 25	
		115,427 03
Total		665,585 00

3. *Statement of the balance in the Treasury of the United States on account of the patent fund.*

Amount to the credit of the patent fund, January 1, 1872	$759,980 03
Amount of receipts during the year 1872	699,798 30
Total	1,459,778 33
From which deduct expenditures for the year 1872	665,585 00
Balance January 1, 1873	794,111 49

4. *Statement of the business of the Office for the year* 1872.

Number of applications for patents during the year 1872	18,946
Number of patents issued, including reissues and designs	13,500
Number of applications for extensions of patents	285
Number of patents extended	240
Number of caveats filed during the year	3,060
Number of patents expired during the year	3,481
Number of patents allowed but not issued for want of final fee	2,302
Number of applications for registering of trade-marks	531
Number of trade-marks registered	402
Of the patents granted there were to—	
Citizens of the United States	13,009
Subjects of Great Britain	445
Subjects of France	51
Subjects of other foreign governments	95
	13,600

5. *Number of patents issued by the United States Patent Office to residents of the different States, Territories, and foreign countries from January 1, 1872, to December 31, 1872.*

[The proportion of patents to population is shown in last column.]

States, &c.	No. of patents.	One to every—
Alabama	45	22,155
Arkansas	13	37,267
California	265	21,133
Colorado Territory	12	3,322
Connecticut	648	929
Dakota Territory	2	7,090
Delaware	42	2,977
District of Columbia	143	921
Florida	8	23,468
Georgia	59	20,070
Idaho Territory	1	14,999
Illinois	863	2,943
Indiana	385	4,367
Iowa	235	5,081
Kansas	73	4,991
Kentucky	145	9,110
Louisiana	76	9,565
Maine	170	3,688
Maryland	242	3,227
Massachusetts	1,435	1,014
Michigan	337	3,513
Minnesota	78	5,637
Mississippi	75	11,039
Missouri	251	6,858
Nebraska	22	5,591
Nevada	22	1,931
New Hampshire	122	1,098

1872	18,246	3,000	13,500	690,736 39	665,591 36

It will be noticed that the number of applications for patents is less than the previous year, while the number of patents granted is greater. This is one of the consequences of a prompt distribution of the Office publications, giving to inventors, manufacturers, and attorneys reliable information as to what inventions are already patented, thereby securing better applications but fewer in number.

It will also be noticed that the accounts show a large increase of expenses over those of the previous year; which calls, perhaps, for a word of explanation. The new gallery in the model room, the finishing and furnishing of what is called the subscription rooms, under the southern porch of the Patent Office, and other rooms for deposit of Office files, has added over $20,000 to the incidental expenses, while the illustrations for the Patent Office Official Gazette, and the copies of drawings of patents, heretofore paid for by the Superintendent of Public Printing, have amounted in cost to over $60,000, making in all more than $80,000 for what has not before been required.

The $61,803.21 paid for reproducing the drawings of back issues is not properly chargeable to current expenses. This work will be completed within a few years, and the expense will then end.

THE PATENT OFFICE OFFICIAL GAZETTE.

The Patent Office Official Gazette was commenced on the first of January, 1871. During the first three months it was published without illustrations. Congress made an appropriation for furnishing illustrations for the Gazette in April last. The appropriation was intended to be sufficient only to furnish the illustrations from that time to the close of the year, but I found, by condensing a larger number of drawings than was originally intended upon a single page, that I could secure illustrations for all the patents issued during the year; consequently the whole volume has been illustrated.

The Gazette was designed to supply a large and growing demand for more prompt and complete information as to the work of the Office than was at that time, or ever had been, furnished by the Office publications. It has been issued regularly every week during the year. It embraces all of the more important decisions of the Commissioner of Patents, all of the decisions of the United States Supreme, Circuit, and District Courts, in cases involving patent or trade-mark questions. The promptness in furnishing these decisions to the Examiners in the Patent Office, to attorneys practising before the Office, and to inventors and manufacturers generally, has very perceptibly improved the character of the Office work. The Judges of the Courts, to whom we have regularly sent it, have expressed themselves highly pleased and greatly benefited by the promptness of the Gazette, in giving to each of them the use of the decisions of all the others in discussing and considering the intricate questions connected with the trials of patent cases. The Gazette has also contained a notice of all applications for extension, a brief digest of all the applications upon which patents have issued, the entire claims of all such patents, and so much of the drawings as would in small spaces best explain the claims.

The Gazette is mailed on Wednesday or Thursday of each week, and always contains a digest and illustrated description of all the patents issued for the week ending the previous Tuesday, thereby furnishing to inventors and manufacturers the means of keeping themselves constantly informed as to the state of any art in which they feel an interest. It is found that this information prevents, in a great degree, the duplication of applications for patents upon the same invention, yet it stimulates the inventive faculties of our mechanics, and improves the character of the applications.

This publication has more than realized the most sanguine expectations of its projectors, and has received unmeasured approbation from all quarters. Its continued publication is almost a public necessity. When the publication of the Gazette was commenced it was the intention of the Commissioner that it should be entirely self-sustaining. This, however, was rendered impossible when Congress appropriated nearly one-half of the edition authorized to be printed, for free distribution to public libraries and to members of Congress. I do not, however, complain of this action of Congress, for I deem the information contained in the Gazette of so much importance to the public that a free distribution of it to the extent authorized is fully justified.

THE MONTHLY VOLUME.

The joint resolution approved January 11, 1871, required that the Commissioner of Patents should cause to be printed and bound into volumes of suitable size, with suitable indexes, the specifications and drawings of all the patents issued, for free distribution to the clerks of all the United States District Courts, to the capital of each State, and to such public libraries as would pay the cost of binding and transportation. I have never been specially impressed with the wisdom of this provision. In accordance with it, however, during the year ending July 1, 1871, I caused to be prepared a volume of the specifications and drawings, complete each week, making fifty-two large volumes for the year, each volume having a name and subject-matter index. The size of these volumes and the numbers of them were so great as to make them comparatively worthless, as but few of the courts and very few libraries could afford the room to place them for any considerable length of time where they could be consulted by the persons for whom they were intended; consequently, since the first of July last, I have caused the specifications and drawings to be published in a more condensed form, running the specifications more closely together, and reducing the size of the drawings to one-fourth that of the previous year, thereby putting four drawings on a page and printing on both sides of the leaf. By this change of form the patents of a month can be put in the space formerly occupied by one week, thus reducing the number of volumes to twelve instead of fifty-two. The drawings, to some extent, will be found, perhaps, too small for critical examination, but this will not occur in more than one case in twenty.

When the drawing proves too small for careful examination any person desiring to learn more about it can order from the Patent Office a complete copy of the drawings of full size, at an expense not exceeding twenty-five cents. This publication might be made popular. If the Commissioner of Patents can be authorized to sell these volumes to subscribers at ten per cent. in advance of the cost of producing additional copies, a considerable number of volumes could be sold; but as the law now stands the Commissioner is not authorized to sell them at a less price than ten cents for each patent, which would make a set of the volumes for one year cost over $1,300, or more than $100 a volume. This, of course, effectually prevents their sale.

OLD DRAWINGS.

For several years past Congress has appropriated the sum of $10,000 a year to reproduce the old drawings in the Patent Office. This work is far more important than is believed by those not familiar with the work of the Office. When a man makes application for a patent, if he is anticipated by any former patent upon the same subject-matter, he is rejected by a reference to such patent. The Office is of course liable to err in this reference by not fully understanding exactly what the applicant desires to cover by his application. The applicant should therefore have the means of fully understanding the references. This can only be given by furnishing him a copy of the drawings of the patent upon which he is rejected.

It frequently happens that the reference only covers a portion of the applicant's claim, leaving him a valuable invention not anticipated. If the drawings of the references could be furnished him in full, he might so amend his application as to run clear of previous patents, and secure to himself what he has actually invented. To furnish such copies by the process of tracing would cost, in general, from two to five dollars in each case. By the process of photo-lithography one hundred and fifty copies may be made of each drawing at an expense to the Office of from three to six dollars. When the drawings are thus reproduced it will be an easy matter, at very trifling expense, to furnish a copy of each drawing referred to in rejections, thus informing inventors exactly as to their rights.

Another reason for reproducing the old drawings in considerable numbers is found in the great saving of time it would secure to the examining corps, and the increased facilities for thorough examinations. The drawings belonging to the classes of mowers and reapers, sewing-machines and attachments, printing-presses, types, and furniture, fire-arms, projectiles, fuses, blasting and torpedoes, carriage-wheels and their parts, felting and hats, &c., have all been reproduced by photo-lithography. Copies of the drawings of all the patents ever issued in these classes have been placed in the rooms of the Examiners having charge of the respective classes, where they may be consulted with care and without waste of time. In classes where the drawings have not yet been reproduced, the Examiners and all others desiring to examine the drawings are compelled to go to the general portfolios and wait upon each other.

Still another reason for reproducing these old drawings is found in the demand of manufacturers for them. A large number of persons have already purchased, at considerable advance above cost, the entire classes reproduced. I am satisfied that the money expended in this work is a wise expenditure, and will in the end be much more than refunded to the treasury by the saving of time and the sale of copies.

GENERAL INDEX.

There has never been published a complete general index, either of patentees or of the subject-matter of

patents. At the beginning of the present fiscal year I caused to be organized a force to prepare such an index. There is no one thing that is more needed by the Office at the present time. In view of the vast number of patents which have been issued, now numbering over 140,000, it is not easy to determine what has or what has not been patented without an index for reference. It is true that since 1836 there has been an annual index published, but these indexes are now so numerous as to make them comparatively worthless, making a general index down to the present time almost an absolute necessity. It will take considerable time, at least another year, before this can be completed; hence no appropriation for its publication will be asked for at this time.

DIGESTS.

An examination of the past work of the Office develops the fact that there are about 7,500 different things which are made the subjects of patents. In the new classification of these subjects which I have caused to be made during the past year, they have been grouped, according to their analogy, into 145 classes. It is very desirable that a thorough digest, showing clearly and fully the present state of the art in each one of these classes, should be made. This is a work that will need to be commenced very soon. The industry of the country, the interests of inventors and manufacturers, as well as the facility of the Office work demands such digest. If a competent person could take the subject of "fire-arms," for instance, giving the present state of the art in that class, by showing exactly what has been invented, and by whom, from time to time, and the improvements that have been made, it would enable the Office to make examinations with far greater facility and accuracy, and in much less time than at present; would enable manufacturers to know more exactly their own rights and the rights of patentees and the public; would enable attorneys and patent-solicitors to prepare their cases with far more intelligence and precision, and would greatly assist the Commissioner of Patents and the judges of the courts in deciding questions of patentability, interferences, and infringements. If such volumes could be prepared under the supervision of the Commissioner of Patents, and be published in sufficient numbers to supply the demand for the same, I am convinced they could be made not only profitable in the way of furnishing much-needed information, but remunerative to the Government. I would respectfully ask the attention of Congress to this matter, and that the Commissioner be authorized to immediately commence this work.

EXTENSIONS.

Until March 2, 1861, patents were granted for the term of fourteen years, with the right of extension when proper cause was shown. Said act provides that the term shall be for seventeen years with no right of extension. I have always doubted the wisdom of that law, and the more thoroughly I become acquainted with inventors and their peculiarities, the more thoroughly I am convinced that the change was an unwise one. It is a fact familiar to all who have given the subject-matter any considerable attention, that a very large proportion of the more valuable inventions are assigned in their infancy for trifling considerations, because of the indigent circumstances of the patentees. Assignees have, in general, made all the money that has been made from the original term of patents.

There is justice in giving a considerable portion of the profits arising from patents to assignees; for, generally, the talent required to create the demand for and to manufacture and successfully introduce into public use the thing invented, is as valuable and meritorious as that exercised by the inventor. That assignees of patents have made large profits is not, therefore, of itself an objection to the law; but the design of the patent laws, under the provision of the constitution, was to encourage and develop *invention* by giving to inventors a monopoly that might compensate them. Experience has developed the fact that a very large proportion of our most worthy and deserving inventors have been obliged to look to the extended terms of their patents for their remuneration. When the invention is first made it is often in advance of a demand for it. The public must be educated up to its want, requiring considerable time and expense before the invention can become remunerative. It is in this stage of the life of a patent that inventors are so often compelled by poverty to sell their inventions for very small sums. When the patent is extended, the extended term belonging to the inventor, and the public now understanding its value, the inventor is enabled to obtain a reasonable compensation for his patent. In this way the extended term becomes far more remunerative than the original.

As mere mechanics and copyists our people are greatly excelled by the older nations; but in useful and labor-saving inventions the people of the United States excel all others. It is difficult to overestimate the extent to which our country is indebted to the genius and industry of our inventors. No other nation has done so much to secure to its inventors the results of their brain-labor. In no other country have the legislatures and courts been so liberal and just in affording protection to the peculiar class of property covered by patents for inventions. The rich development of valuable inventions which have so distinguished our country is largely due to our recognition of the just rights of inventors. The act of March 2, 1861, I am fully persuaded, was legislation in the wrong direction, and that the encouragement of useful inventions, as well as justice to inventors, requires a right in the inventor to secure extensions in meritorious cases.

ROOM.

The question of room for the Patent Office is becoming more and more serious every day. At the present time the working force is greatly crowded, and we are compelled to occupy rooms under ground, and with necessarily very imperfect ventilation. The health of many employés has been very seriously impaired, and the work of the Office greatly impeded. Since I have been in the Office, now less than two years, eight persons have died, whose deaths were attributable, probably, to the occupancy of rooms unfit for such purpose. The files and the documents of the Office are crowded into such small and inconvenient spaces as to be very difficult of access, and very damaging to the files themselves. When additional rooms can be furnished for the working force of the Office, those now unsuitable for occupancy by employés can be fitted for receiving the Office files. I earnestly hope that some provision may

be made whereby the work of the bureau may have sufficient room to be promptly and properly executed.

The model gallery has long been a place of great interest, not only to inventors, but to all visitors at Washington. I believe that the United States is the only government which issues patents that demands models of the inventions. The wisdom of this demand cannot be questioned. Many of the points connected with patents that arise for examination before judges and juries, appeal boards and commissioners, are of such character that none but the most skilled experts could determine them from drawings and written descriptions alone. When an invention has been embodied in the form of a good model it has become tangible, and intelligible, and certain, to a much larger class of persons than when shown only in drawings. The spirit of our patent laws demands that before a monopoly shall be granted to an inventor he shall make his invention as *patent* to the public as possible; hence, I think a model should be required with every application.

The question of room wherein to keep the models has been the strong argument against requiring them. It is very apparent that the addition of over twenty thousand models a year to the present vast accumulation would ultimately occupy the whole of the Patent Office building, to the exclusion of everything else. The question of furnishing space for the models has long been a troublesome and puzzling one, and must of necessity be very soon settled. While I am of the opinion that models should always be demanded when the invention is of such a nature as to admit of being shown in a model, I am not so clear as to the necessity of their being forever retained. The models of rejected applications might be disposed of as soon as the applications are finally abandoned. Nearly all of the models upon which patents have been granted become useless to the Office and to the inventor as soon as the patents have expired and the inventions become public property. The models of fundamental inventions, and such others as may be necessary to show clearly the rise and progress of the different arts represented in the Office, should, of course, be always retained. All others might be removed from the model gallery soon after the expiration of the patents. Under authority of Section 14 of the Patent Act, I have disposed of over forty thousand models of rejected applications. Nearly all of these have been deposited in such colleges and other incorporated institutions of learning in the several States as cared enough for them to pay for boxing and transportation, and hold them subject to the order of the Commissioner of Patents. The influence of these models in our schools is reported as excellent. They aid materially in giving a knowledge of the practical application of the principles of mechanics, and in developing a taste for the useful arts. These models are simply loaned to these institutions, where they are held in trust for the Patent Office. Full lists of them are retained at the Office.

I would respectfully suggest that the Commissioner be authorized, under proper restraints, to make similar deposits of such models of expired patents as can be spared from the Patent Office. The determination of what models of expired patents may safely be sent from the Office should not be left to the Commissioner or any other one man. A commissioner of radical or eccentric notions on the subject might do irreparable damage to important classes by the removal of models constantly needed in the office. If the Commissioner of Patents and the member of the Board of Examiners-in-Chief oldest in commission should be constituted a permanent board for this purpose, and each of the Examiners in charge of the classes in turn become a member of said board when determining upon the models belonging to the classes under his special charge, there would be very little danger of mistakes being made in the disposition of models. Under the provisions of such a law the present model gallery will probably be abundantly sufficient for a century to come. I respectfully ask the early attention of Congress to this matter.

THE CIVIL SERVICE.

The new rules for the civil service went into operation in this bureau in May last. I was not sanguine as to the wisdom of their adoption, but determined they should have a fair and impartial test in the Patent Office. When called upon by the Honorable Secretary of the Interior for the name of a suitable person to be appointed on the Examining Board I named a man distinguished not only for scholarship, but for sound practical judgment. In the examinations I have in no way interfered, and have expressed no preferences for candidates. I believe the Examining Board have conscientiously framed their questions, and conducted their examinations with the single view of securing the best men for the vacant positions; and the result has greatly transcended my expectations. It has stimulated to study and efficiency the former employés, and has brought into the Office a class of intelligent, vigorous, and enterprising young men whom it would have been difficult to obtain by any other system. Men having the best qualifications and most merit will rely least upon outside influence and pressure for positions, and under the old system were generally the last to obtain them.

The design of the civil service rules is to secure the best qualified and the most meritorious. For this bureau the examinations have aimed to test the applicant's special fitness for the vacant positions, and the questions have been thoroughly practical. One hundred and ninety-two persons have been examined for promotions, seventy-four of whom passed above the minimum standard, and forty-nine have been promoted. Fifty-two have been examined for original appointment, twenty-two of whom passed above minimum, and nine have been appointed. The operation of the civil service rules has certainly very greatly improved the efficiency of the working force in the Patent Office.

The civil service is clogged and impeded, however, by obstacles not provided against in the new rules. If ten men are appointed to positions to-day, nine of whom prove to be well qualified, active, intelligent, and efficient, and one barely above the minimum in these requisites, four years hence will find that the nine have developed into men of too much spirit and enterprise to remain in clerical positions, and have entered the business pursuits of private life, while the tenth will probably be plodding along in the office, of less value than when first appointed, yet willing to stay without advancement as long as the appointing power, under pressure of outside influences, can be induced to retain him. By this process a comparatively worthless

sediment accumulates in the bureaus, impeding, depressing the character, and increasing the expense of the civil service. If the Civil Service Commission can invent a broom that will effectually sweep out this sediment I shall deem it worthy of a patent.

CANADIAN LAWS.

In my last annual report I took occasion to complain of the want of reciprocity in the patent laws of the Dominion of Canada. As those laws then stood they contained a provision that no patents should be granted except to persons who had resided for the year last past in Canada. This, of course, precluded citizens of the United States from obtaining patents there, while citizens of Canada could obtain patents here on the same terms as our own citizens, and without restriction as to residence. The last session of the Canadian Parliament, however, expunged that unfriendly provision, and in many other respects made their patent laws more liberal and more certain in their protection of inventors. Their new law is substantially the same as our own, and gives great satisfaction to our inventors.

REORGANIZATION.

Again I respectfully ask the attention of Congress to the President's special message and accompanying documents of March 15, 1872, in relation to the reorganization of the Patent Office. The commercial importance of patents for inventions is rapidly increasing. After careful and extended inquiry I am convinced that considerably more than one-half of the capital employed in manufacturing in the United States is thus invested, because of the security to specialties obtained from patents. For this reason the demand for better examinations and more care as to the wording of specifications and claims before issuing patents or rejecting applications, is increasing every day. In other words, the character of the work done in the office and the facilities for doing it promptly are not nearly up to the public demand. I am of the opinion, however, that no very considerable improvement can be made under the present organization. The business of the Office is being done under a plan of organization adopted in its infancy—a plan adequate to its wants at that time, but which has been outgrown by its enormous increase of business. Until a reorganization can be effected that will secure a revision of the most important work of the Office, the rights of inventors and manufacturers will be needlessly jeopardized, and the character of the Office and the utility of the patent laws will remain in doubt. The reorganization suggested is fully embodied in the bill for that purpose now pending in the House of Representatives.

Respectfully submitted.

M. D. LEGGETT,
Commissioner of Patents.

CANADA PATENT OFFICE.

ADDITION TO THE RULES AND REGULATIONS OF SEPTEMBER, 1872.

1. DRAWING.

In order to allow the Patent Office to have a Patent Office Record printed and published, containing the claims and drawings of all patents issued, it is further directed, in addition to the requirements of rule 13 and form 15, that—

One drawing on a sheet of card-board 8x13 inches will be required of each invention, in addition to those ordered by rule 13 and form 15. The sheet is to be without writing on its face, merely the usual lettering required on the drawing; written title, references, certificate, signature, &c., not being necessary.

Where several sheets and figures are furnished, in accordance with rule 13, any one figure which will best give a general idea of the invention will be sufficient.

The card-board to be used must have a smooth or calendered surface. A sheet of "double-thick Bristol board" or "Whatman's drawing-paper" is recommended.

All drawings must be clear, sharp, well defined, not too fine, and *perfectly black*.

Lines that are pale, ashy, very fine, ragged, or rotten, give bad results when photo-lithographed.

Brush-shading, tinting, and imitation surface-graining should never be used, and in fine shading the result should be attained with as few lines as possible.

Section lines also should be as open in their spacing as the case will admit of, and these, as well as all right lines, in order to insure clearness, should be made with a ruling pen. The shading of convex and concave surfaces may be dispensed with when the invention is otherwise well illustrated.

Shade lines may sometimes be used with good effect, but heavy shadows, where they would obscure lines or letters of reference, should be avoided.

The card-board drawing should be rolled on a roller for transmission to the office, as folding will prevent its usefulness for photo-lithography.

2. SPECIFICATIONS.

The duplicate specifications in every application must each be identified by the justice or judge, who takes the affidavit of the inventor, as "the specification referred to in the inventor's affidavit annexed," such identification to be, by certificate, written at end of and in each such specification: thus:

"This is the specification referred to in the affidavit of ——— ———, hereto annexed.

"Sworn before me this day of A. D. 18 .

"——— ———, *Judge or J. P.*"

3. AFFIDAVIT.

In all cases of applications for patents where the affidavits are made out of Canada, and before a judge, the seal of the court presided over by such judge must be affixed to such affidavit.

January 14, 1873.

COMMISSIONER'S DECISIONS.

SAML. B. JEROME.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Samuel B. Jerome for patent for* TABLET FOR CLOCK FRONT ORNAMENTATION, *filed January* 3, 1873.—*Decided January* 17, 1873.]

The words "article of manufacture" do not necessarily raise a device to the dignity of a patentable invention.

A case in which the description, instead of showing a new invention, merely describes a well-known practice.

LEGGETT, *Commissioner:*

Applicant says his invention consists in making an ornamental tablet for a clock-front by "applying paper, upon which the illustration or ornamentation is first made, to the back of a piece of glass, the paper first being moistened, then the edges turned over, and glued or otherwise secured to the front or outer surface of the glass, so that when the moistened paper dries it will shrink tight down upon the glass, giving it the same appearance as when the painting is made directly upon the glass," which latter, it is alleged, is the process heretofore employed.

His claim is—

"As an article of manufacture, the herein-described clock-tablet, consisting of the glass and paper illustration, combined and secured together as set forth."

He seems to rely on the words "article of manufacture" to raise his device to the dignity of a patentable invention. They do not have that virtue. The references cited by the Examiner are in point. Besides, in every picture-store will be found engravings attached to the backs of pieces of glass in this way, and it has been done no one knows how long. This is the "article" claimed, no matter to what use it may be applied.

The decision of the Board is affirmed.

FAIRBANKS AND ROBINSON.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Fairbanks and Robinson for patent for* BEVEL-SQUARES, *filed January* 2, 1873.—*Decided January* 18, 1873.]

A claim should conform to the parts and combinations shown, and should not be so broad as to cover a principle and preclude all improvement in an article.

References, as affording data in rejecting a claim, should be cited in preference to offering a mere legal opinion or a "simple dictum."

LEGGETT, *Commissioner:*

Applicant's "bevel-square" is composed of two centrally-slotted blades or tongues pivoted in one end of a suitable handle, and he says his invention consists—

"In combining in a single handle two adjustable and independent tongues, one of which may be set at right angles, while the other is free to be turned to any desired angle."

The decision of the Board was adverse as to his first and fourth claims, which are as follows:

"1. The combination of two blades in a single handle, both made adjustable and combined with a mechanism whereby one of the said blades may be set at a right or other defined angle, and the other adjustable to different angles, substantially in the manner herein set forth.

"4. In combination with a longitudinally-moving slide, L, in the handle of a bevel, we claim the inclined washer *i* between the blade and the said slide, so that the said slide being forced beneath the said washer, forces the said washer against the blade to secure the blade in position, substantially as described."

The first claim is as broad as the statement of invention, and applicant seeks by it to secure a monopoly of bevel squares having two blades, one of which may be set at right angles while the other is left free to move. In other words, he asks for an exclusive property in a certain general plan of construction of squares, without reference to any particular mechanism by means of which it is embodied. If his claim could be allowed, and could be sustained in court, it would prevent all improvement of this class of squares. All invention would be repressed by a monopoly of the broad idea or principle of construction. It is possible applicant has invented only an imperfect means of adjusting and securing his blades. It is desirable that no obstacle shall stand in the way of the production of the best means. But if applicant has produced the best means, then by claiming only the parts and combinations he actually shows he will be amply protected. In any event these are all he can lawfully secure.

The Examiner, in his answer to the reasons of appeal, says that he rejected the fourth claim "without a reference and on a simple dictum." He at the same time cites three opposite references, apparently by way of corroborating his judgment. They do not have that effect, however. They show that the subject-matter of the claim is old as a device for the purpose here accomplished, and not that if new in this connection it would not be patentable. In fact there is strong ground for a contrary opinion. It is proper sometimes to stand upon an *ipse dixit* or mere legal opinion, but it is only advisable in the absence of any other ground of adverse action. The practice is extremely likely to be unsatisfactory, because the opinion relied on may be erroneous. When there is a reference a "simple dictum" should not be resorted to. The Examiner in this instance should have cited his references, and that would probably have ended the question as to this claim.

The decision of the Board is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

DECKER *vs.* GROTE *et al.*

[*In Equity.—Before Blatchford, J.—Decision January* 2, 1873.]

PATENT OF LEVI DECKER, BILLIARD-TABLE CUSHIONS, DECEMBER 18, 1866—ABANDONED EXPERIMENT—EVIDENCE OF PRIOR USE—MODIFICATIONS IN REISSUES.

Decker's invention construed to be the placing and firmly securing along the upper edge or corner of the rubber cushion of a billiard-table a strong narrow cord to receive the impact of the ball and protect the cushion against such impact, by reason of its being placed at the point against which, and against which alone, the ball strikes.

Decker's invention is not anticipated by that of Carpenter, who inserts whalebone or wire in a groove made in the upper and outer edge of the cushion, the wire being lifted by the force of the ball, when the ball embeds itself in the face of the rubber underneath, and thus, by its action as a spring, tending to hug the ball firmly upon the table and prevent it from hopping or jumping—the wire, however, neither receiving the impact, nor reducing the friction caused thereby, nor concentrating the elasticity of the rubber at the point of impact, nor protecting the cushion from wear, nor securing greater accuracy of rebound.

Decker's invention not anticipated by the patent of Syrcher, who inserts a strip of horn in a long slit in the cushion in such position as both to destroy the homogeneous character of the cushion and to prevent the cushion from either receiving the impact of the ball in a horizontal direction or returning the resilience of the rubber in such direction.

Where a model was filed in the Patent Office which differed from the description of the specification and accompanying drawings, and which was afterward declared by the applicant not to show his invention "truly," a second model thereupon being filed which removed the discrepancy: *Held*, that whatever there was in the first model different from what was found in the second was an abandoned experiment.

Where a person was referred to in the answer without mention of his place of residence, merely as one who had made a prior application for a patent, alleged to show plaintiff's invention, and was subsequently examined by defendants as to his prior knowledge and use of said invention: *Held*, that such testimony was properly objected to.

Where plaintiff, in reissuing his patent, introduced certain modifications of the invention as originally patented, such modifications being the equivalents of the original device and resulting from experience in its use, but not involving any new or further invention: *Held*, that there was not such a repugnancy between the two patents that it must be held, as a matter of legal construction, that the new patent was not for the same invention as that secured in the original one.

A suit in equity, brought by Levi Decker against Frederick Grote and others, in the Southern District of

New York, for an alleged infringement of reissued patent for an "improvement in cushions for billiard-tables," granted complainant March 9, 1869, the original having been issued December 18, 1866.

The invention and the various defenses are fully stated in the opinion.

[*Abbott & Fuller*, for complainant.
B. F. Lee and *A. Pollok*, for defendants.]

BLATCHFORD, *Judge:*

This suit is brought on reissued letters patent granted to the plaintiff March 9, 1869, for an "improvement in cushions for billiard-tables," the original patent having been granted to him December 18, 1866. The specification of the reissued patent says: "My invention has for its object the preservation of cushions for billiard-tables against the impact of the ball. The nature of my invention consists in the employment or use of a catgut or other strong cord located in or at the upper corner or edge of the cushion, and immediately at the point against which the ball strikes when the game of billiards is played. * * * C is a body of rubber which forms a cushion against which the ball strikes. This said rubber cushion has its inner or face side beveled in such a manner that the ball strikes at about its center against the upper corner or point of the cushion, as clearly shown at *a* (Fig. 1.) For the purpose of protecting the upper corner or edge of the cushion C against the impact of the ball, I make a small concave or bed immediately, or as near as may be, in the upper corner of the cushion, so that a suitable cord, E, or other support may be fitted longitudinally the whole length of the said cushion around the table, so that the cushion is fully protected on all sides of the table against the impact of the ball. For this cord and support of the cushion I usually employ catgut, or cord may be used for the same purpose, but experience proves that catgut is most suitable for the purpose, as it is best adapted to prevent the cushion from giving way or yielding under the impact of the ball, it being understood that the ball only comes in contact with the cushion at *a*, the bevel or inclination being given the face of the cushion in order that all other parts of it will be kept clear of the ball. This cord E may be thoroughly secured in its position by molding it or embedding it entirely within the rubber near the corner, so as to perform the functions for which it is designed, or it may be secured by gluing a strip of cloth, *b*, over it, when not fully embedded in the rubber, or it may be secured by any other well-known means. D is a strip of elastic cloth which is cemented to the face-side of the rubber strip or cushion C, and attached at its lower edge to the lower part of B," (elsewhere described as a strip or cleat behind C,) "so as to support the upper edge *a* of C. It will be understood that the cord E is attached to D before the latter is secured to the cushion C and cleat B. To make the whole more secure, I usually cover the whole with the cloth F, and after cover the whole again with the usual green cloth G. This cord E performs two very important functions, viz: It gives stiffness to the angle or corner *a* of the cushion C, so that it cannot yield or give way under the impact of the ball, to allow the latter to pass over it; and it also gives prominence to the said angle so as to present, under the yielding of the cushion, a stiff narrow line to the ball, thus obviating much friction, so as not to impede the motion of the latter, and still not interfering in the least with the elastic effects of the cushion upon the ball."

The claim is in these words:

"The catgut or other cord E partially or fully embedded, or otherwise attached, at the angle *a* of the rubber cushion C, so as to protect said cushion against the impact of the ball, substantially as herein shown and described, and for the purposes set forth."

It is quite apparent that the invention set forth is the placing and firmly securing, along the upper edge or corner of the rubber cushion, a strong narrow cord to receive the impact of the ball, and protect the cushion against such impact, by reason of its being placed at the point against which, and against which alone, the ball strikes. When the impact comes the stiff cord receives it in substantially a horizontal direction, and prevents the cushion from giving way under such impact, and allowing the ball to ride over it and leave the table, while at the same time there is little friction from the impact, and the elastic force of the rubber acts fully, through the cord interposed between it and and the ball, to repel the ball in substantially a horizontal direction.

The great utility of the invention in tending toward perfection in the billiard-table is shown by the evidence. The inventor was an experienced manufacturer of billiard-tables. The cushion had, up to the time of his invention, in the latter part of 1864, been faced with a flat facing made of various materials. But the flat facing failed to add the necessary greater proportional strength to the upper corner or edge, and the plaintiff sought to do that, while at the same time the rubber below the edge not being faced would have its elastic action left unimpaired. The idea of a cord of catgut, to be secured to the upper edge, suggested itself to him. He arranged it in the manner described in the specification of the reissue, and shown in the drawing, by laying the catgut along the edge of the elastic cloth which he had been using as a facing, and securing it there by wrapping a piece of cloth around it and attaching that to the elastic cloth, and cementing the latter to the rubber. The moment the invention became known it went extensively into use, and the cushion thus made superseded all other forms. A resulting feature of the arrangement is shown by the evidence to be that a larger amount of the elasticity of the cushion is brought to bear at the point of contact of the ball with the cord than when, in the absence of the cord, the ball strikes the rubber itself. The cushion is also protected from wear. Greater accuracy also results in respect to the direction the ball takes in rebounding.

In the defendants' arrangement the cord is embedded in the rubber cushion at the upper edge of it, and is secured there by being placed in it while the rubber is plastic, and before it is vulcanized, and by having a thin portion of the rubber interposed between the cord and the outside of the edge. There is no doubt that the defendants' arrangement embodies the invention claimed in the plaintiff's reissued patent, and has the same mode of operation in use.

The novelty of the invention is attacked by reference to an application filed in the Patent Office January 18, 1858, by William B. Carpenter, for a patent for an "improvement in billiard-cushions," and which was rejected April 10, 1858. The specification filed by Carpenter says: "The nature of my invention consists in providing a block of India rubber, cut or molded in the desired shape, with a groove, which groove is to be made along the entire upper and outer edge, in which groove is to be placed a wire composed of whalebone, steel, brass, or other elastic material suitable for the purpose." Carpenter then proceeds to say, in the specification, that he makes a groove at the outer and along the entire upper edge of the rubber, and inserts in the groove along its length a round piece, the size of the groove, of whalebone or steel, or brass wire. The drawing shows the wire lying in the groove, and not otherwise secured, and with its upper face exposed to view. The specification says that the cushion is to be "covered with cloth in the usual manner of billiard cushions," and is then ready to be used. It then states, as the reasons for such arrangement of cushion, that if a ball is played against a square-edged cushion of rubber, all parts of the same being equally elastic, the momentum of the ball, if the stroke be an energetic one, will be liable to so far overcome the resistance of the rubber as to cause the ball to jump or hop either on or off of the table; that he wishes to preserve the delicate elasticity of the rubber, and at the same time to keep the ball at all times upon the table, and free from hopping or jumping; that to accomplish this he makes the groove in the rubber and inserts therein the whalebone or wire; and that this has the effect of stiffening the entire upper edge, and prevents the momentum of the ball from overcoming the weakest part of the rubber, because, "when the ball advances with considerable force and is embedded into the rubber, the whalebone or wire is lifted, the ball acting as a wedge, and, from the natural tendency of the wire to resume its former position, it hugs the ball firmly upon the table, which allows the rubber to repel the ball without hopping or jumping." The drawing accompanying Carpenter's specification corresponds therewith, in showing the rod of whalebone or wire as being laid in a groove cut in the top surface of the rubber, along the upper and outer edge; but the model he sent therewith showed the groove as cut just below the top surface, and in that face of the cushion which would be toward the bed of the table. The Patent Office, in a letter to Carpenter of January 20, 1858, called his attention to this discrepancy, and stated that the model showed the groove "along that face of the rubber cushion against which the ball strikes," and suggested to him that, if his specification and drawing were correctly understood, a different model would be necessary. In reply, he wrote to the Office saying that the specification exactly described what was meant to be described, and the drawing agreed therewith; that there was a discrepancy between the specification and drawing and the model; and that he would make another model showing the invention truly, as he wished it to be shown—that is, with the groove and wire "at the upper and outer edge of the rubber, and not at the inner edge, immediately in contact with the ball." The new model, constructed to correspond with the specification and drawing, was sent and filed January 26, 1858, and the application was rejected, as before stated. The ground of rejection was a patent granted to the present plaintiff December 15, 1857, "for the combination of a steel spring with India rubber, for the same purpose." The claim asked for and rejected was—

"The forming, in a block of rubber for billiard-cushions, the groove, and inserting therein the round whalebone, steel, or other wire, substantially and for the purpose as herein described."

On the 5th of June, 1858, Carpenter wrote to the Office that he withdrew his application.

It is impossible to regard this application as anticipating the plaintiff's invention. The invention of Carpenter, as shown in his specification and drawing and correct model, was one of a wholly different character from that of the plaintiff. Carpenter shows that he intended that the ball should be played against the rubber, and should embed itself "into the rubber," and that the rubber should not receive the impact of the ball through the medium of the whalebone or wire. His device was one merely to put a stiff piece of elastic material along the upper face of the rubber, which should be lifted by the force of the ball, when the ball embedded itself in the rubber beneath, and should, by its action as a spring, hug the ball down to the table and prevent its hopping or jumping. This is a different arrangement, and for a different purpose, from that of the plaintiff. In Carpenter's arrangement the whalebone or wire does not receive the impact of the ball, and does not protect the cushion against such impact, and is not placed at the point against which, and against which alone, the ball strikes; the whalebone or wire has no effect to reduce the friction of the impact of the ball; the elasticity of the rubber is not, by the wire, concentrated at the point of impact of the ball; the cushion is not protected by the wire from wear at the point where the ball strikes; and no greater accuracy of direction in the ball in rebounding results from the use of the wire. These are all features of the plaintiff's arrangement. The only feature that is common to the two arrangements is that the stiffening of the edge of the rubber has the effect to prevent the ball from jumping. But this, while it is an incident of the plaintiff's arrangement, does not cover other features which the claim of his patent, read in connection with the body of his specification, sets forth as inherent in his arrangement, and those features, so set forth, are not found in Carpenter's arrangement.

Another difficulty in Carpenter's arrangement is that he neither shows nor describes any mode of fastening or securing the whalebone or wire in the groove, except that, after it is "placed" or "inserted" in the groove, the cushion is to be "covered with cloth in the usual manner of billiard-cushions." It is evidently not intended to be secured or fastened so as to become, as is necessary in the plaintiff's arrangement, an integral part of the structure of the rubber cushion, for Carpenter describes it as intended to be lifted by the action of the ball, as a wedge, when embedded in the rubber beneath it. Hence, in Carpenter's arrangement the wire does not receive a practically horizontal blow from the ball, and in yielding compress the rubber behind it, and bring the elastic force of such rubber into action to repel the ball in a horizontal direction. That is an essential feature of the plaintiff's arrangement, for he says in the specification of his reissue that the face of the rubber cushion is so beveled that the ball strikes at about its center against the upper corner or edge of the cushion, along and in which the cord lies, and that the ball does not come in contact with the cushion at any other part of the cushion. A lifting of the cord, as in

Carpenter's arrangement, would entirely destroy the plaintiff's arrangement. Hence, the plaintiff firmly secures his cord in place, so that it may receive the horizontal blow. No such arrangement is found in Carpenter's specification. But such arrangement is found in the defendants' structure. The thin edge of rubber interposed between the defendants' cord and the outer extremity of the cushion merely acts to hold the cord in place, so that it may be always in position to receive a practically horizontal blow, and is a mere equivalent for the cloth in which the plaintiff wraps his cord. There is an advantage, as respects utilizing the elastic force of the rubber to the greatest possible degree, in having the cord as near to the ball as possible; but if it makes too prominent an edge, its covering is apt to wear too rapidly. But that is a question only of durability. The invention of the plaintiff is employed if the cord is found in the place indicated, so firmly secured and so arranged as to act always in the manner indicated, in combination with the cushion behind it, in reference to a blow from the ball delivered in the manner stated. The defendants make and sell a structure of that kind, and no such structure is found in Carpenter's arrangement.

As respects what appears in Carpenter's first or incorrect model, (both of the models being now in the Patent Office,) it is manifest that he never pretended to have made an invention of anything shown in it, if it shows anything different from what is shown in his second model. He expressly says in his letter to the Office that the first model does not show his invention "truly." Whatever there is in the first model, therefore, that is different from what is in the second model was, at most, a mere abandoned experiment, not amounting to an invention. It is manifest, moreover, that a structure like that represented by such first model would be open to many of the objections before specified, to which one like such second model is open.

Carpenter was examined as a witness on the part of the defendants. His name is not set forth in the answer as that of a person to or by whom the plaintiff's invention was previously known or used. His application of January 18, 1858, is referred to in the answer as containing the plaintiff's invention. But his place of residence at the time of putting in the answer is not given in the answer. After he was sworn as a witness, and before any questions were put to him, an objection was entered on the record, on the part of the plaintiff, to his being examined, on the ground that he had not been named in the answer, and that the notice required by statute had not been given of his examination. The bill in this suit was filed in August, 1871. He was cross-examined *de bene esse*, under the same objection so made to his direct examination. Such objection to the testimony of Carpenter, so far as it tends to prove prior knowledge or use of the plaintiff's invention, was insisted on at the hearing, and a motion was made by the plaintiff to strike out such testimony in such respect. The motion must be granted.

But even if the testimony of Carpenter were to be admitted in such respect, it adds nothing to what appears in his application. He says that he made experiments with "the cushions" shown in the two models before he applied for a patent; that those experiments were, using "a cushion," two feet or less long, screwed to the bed of a table, and tested for about half a day by various parties; that such experiments were considered satisfactory enough, in hindering the ball from jumping, to apply for a patent; and that the cushion stood the blows of the ball and the wire was not dislodged. It does not appear that any billiard-table provided with such cushions as Carpenter's was ever made by him or any one else. The whole matter, so far as Carpenter testifies to having done anything, was an abandoned experiment.

What is found in letters patent granted to John Syrcher, November 10, 1863, for a "billiard cushion," is adduced to destroy the novelty of the plaintiff's invention. Syrcher uses thin strips of horn cut spirally, in connection with hard or soft rubber, to form a cushion. The strip of horn is used as a facing to the rubber pad, or is inserted into a long slit cut in the pad and made fast therein by rubber cement. The grain of the horn in the spiral strip runs crosswise of the strip, so that when the ball strikes the cushion the spring action of the horn, although crosswise of the strip, is with the grain and not crosswise of the grain. When the strip is inserted in the pad it is shown as extending downward from the upper exterior corner of the pad in a slanting direction, away from the face of the pad. A facing to the pad presents nothing in common with the plaintiff's invention. In the case of the inserted strip of Syrcher, the action of the cushion under the impact of the ball is different from what it is in the plaintiff's arrangement. The cushion does not yield in substantially a horizontal direction, because of the interposition of the strip of horn. For the same reason the resilience of the rubber is not returned to the ball in substantially a horizontal direction. By inserting the strip Syrcher destroys the homogeneous character of the cushion. The plaintiff preserves the homogeneous character of the cushion. From this difference results the different action of the two cushions under the impact of the ball and in response thereto. It follows that nothing in Syrcher's arrangement anticipated the plaintiff's invention.

As to what Delaney did in California, he details a series of abortive and abandoned experiments. He himself calls them experiments. One of them he describes as the use of rubber with "whalebone and drum-snares cut into the upper edge, and there fastened into the groove with court-plaster, to hold the whalebone or drum-snares put into the rubber." He says that he inserted the drum-snares as close as possible to the upper edge of the cushion, along such edge, and "about one-fourth of an inch from the face where the ball strikes;" that he discontinued the use of drum-snares and commenced using whalebone, because he thought it was better, as having more elasticity; that he discontinued the use of whalebone because some one offered to furnish him strips at less money than he was paying if he would use such strips; and that he did not apply for a patent for inserting drum-snares or whalebone in rubber billiard-cushions because he did not think it was of any value at the time.

The answer sets up that the reissued patent granted to the plaintiff is void, for the reason that it describes and claims an invention different from any invention described or claimed, or intended to be, in the original patent, or shown in the model, drawings, or application on which the original patent was granted. The drawings of the reissue are the same as those of the original patent.

It is objected, (1) that the original patent states that the invention consists in applying a cord "to" the upper angle of the cushion, while the reissue states that it consists in using a cord located "in or at" the upper corner or edge of the cushion; (2) that the reissue states that a small concave or bed is made immediately, or as near as may be, in the upper corner of the cushion, in which the cord may be fitted, while the original specification and the drawing disclose no such concave or bed; (3) that the reissue states that the cord may be more thoroughly secured in its position by molding it or embedding it entirely within the rubber near the corner, while the original specification and the drawing do not suggest any such thing; (4) that the reissue suggests the embedding the cord partially in the rubber, while nothing to that effect is found in the original specification or in the drawing; (5) that the partially or fully embedding the cord, found in the claim of the reissue, is not suggested in the original specification or by the drawing. The specification of the original patent describes the cord as applied to the edge or angle of the cushion, by inclosing it in a strip of cloth cemented to a strip of elastic cloth, which itself is cemented to the face side of the rubber cushion. Whether this cord is wholly external to the rubber cushion, and so requires to be firmly attached to such cushion by applying means of adhesion, or is partly within such cushion, and so can be more easily attached with firmness thereto, or is wholly within the cushion, and so is kept firmly in its place by the rubber which is exterior to it, is a mere matter of mechanical adaptation, having no relation to the real invention. Each arrangement is an equivalent for the other, as respects such invention. One may involve more durability than the other, but that is a point aside from the invention. The plaintiff testifies that when he arranged the cord wholly external to the rubber, as described in the specification of his original patent, it "wore the cloth a little faster than it would otherwise," and that he then had a set of molds made in such a way as to leave a groove in the upper edge of the cushion to receive the cord, which obviated the objection of wearing out the cloth. This groove admitted of a partial embedding of the cord in the rubber. Embedding the cord wholly in the rubber was a mere question of degree. The plaintiff was entitled to use all these forms within his invention, as modifications resulting from experience in its use, not involving any new or further invention. Within the rule laid down in *Seymour* vs. *Osborne* (11 Wallace, 516) it cannot be said in this case that it is apparent, on the faces of the two patents, that the Commissioner has exceeded his authority in granting the reissue, or that there is such a repugnancy between the two patents that it must be held, as a matter of legal construction, that the new patent is not for the same invention as that embraced and secured in the original patent.

It results, from these considerations, that there must be a decree for the plaintiff for a perpetual injunction, and an account of profits and an ascertainment of damages, with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C COOK, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

22,941.—*Railroad-Car Springs.*—Granted to AUGUSTUS B. DAVIS, February 15, 1859; reissued January 6 and March 17, 1863. Hearing January 29, 1873.

22,947.—*Wrenches.*—Granted to DANIEL P. FOSTER, February 15, 1859. Hearing January 29, 1873.

22,990.—*Mop-Heads.*—Granted to LUKE TAYLOR, February 15, 1859; reissued November 10 and 24, 1868, and October 19, 1869. Hearing January 29, 1873.

23,001.—*Elastic Toys.*—Granted to LUCIUS P. FOSTER, February 15, 1859. Hearing January 29, 1873.

23,011.—*Water-Wheels.*—Granted to N. F. BURNHAM, February 22, 1859; reissued September 1, 1863. Hearing February 5, 1873.

23,022.—*Molding Covers for Cook-Stoves.*—Granted to GEORGE W. GARDNER, February 22, 1859. Hearing February 5, 1873.

23,032.—*Steam-Pressure Gages.*—Granted to T. W. LANE, February 22, 1859. Hearing February 5, 1873.

23,033.—*Hose-Couplings.*—Granted to ROBERT B. LAWTON and WILLIAM H. BLISS, February 22, 1859; reissued December 21, 1869. Hearing February 5, 1873.

23,034.—*Fire-Plugs.*—Granted to JOSEPH L. LOWRY, February 22, 1859; reissued August 14, 1860, and July 30, 1872. Hearing February 5, 1873.

23,040.—*Locks.*—Granted to LYMAN F. MUNGER, February 22, 1859; reissued December 12, 1871. Hearing February 5, 1873.

23,060.—*Electro-Magnetic Fire-Alarm Apparatus.*—Granted to MOSES G. FARMER, February 22, 1859. Hearing February 5, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 12, 1873.

23,097.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 12, 1873.

23,105.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 12, 1873.

23,152.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 18 3.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PETTEE, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD EBER, March 29, 1859. Hearing March 12, 1873.

23,351.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 29, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,630.—*Burnishing Machines.*—Granted to LE ROY S. WHITE, April 6, 1859. Hearing March 19, 1873.

23,595.—*Railroad-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,633.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,636.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,590.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,629.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUANLER, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL ROY and MOSES R. SHALTENS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,834, 4,835, and 4,836, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,920, 1,921, 1,922, and 1,923, June 6, 1865; No. 1,560 having been ordered to again reissue, No. 5,229, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,816.—*Regulators for Time-Keepers.*—Granted to RALPH S MERRIMON. April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,893.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,976.—*Stoves.*—Granted to JOHN G. WIDMAYR, May 10, 1859. Hearing April 23, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. UNDWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,093.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

EXTENSIONS GRANTED.

22,742.—*Improved Bed-Bottom*, granted to B. F. S. MONROE, January 25, 1859.

Claim.—The two frames A C, with the springs B secured between them, the frames being connected by the cross-bands F, covered or inclosed by any suitable fabric, E, and the upper frame supporting the seat or mattress D, the whole being arranged substantially as and for the purpose set forth.

22,753.—*Improvement in Many-Barreled Fire-Arms*, granted to CHRISTIAN SHARPS, January 25, 1859; reissued June 1st, 1861, numbered 1,199; reissued February 12, 1867, numbered 2,480.—Division A.

Claim.—The combination of a discharger with the hammer and the devices herein described, or the equivalents to the same, for changing the position of the discharger on the movement of the hammer.

22,787.—*Improvement in Stoves*, granted to POWTER DODGE, February 1, 1859. (WILLIAM M. PINGRY, administrator.)

Claim.—An improved air-tight stove, the several parts being constructed and arranged in relation to each other, substantially as shown and described.

22,792.—*Improved Machine for Manufacturing Wooden Troughs*, granted to SAMUEL T. FIELD, February 1, 1859.

Claim.—1. Arranging the bearings of the saw and the mechanism by which it is driven, substantially as described, whereby the upper surface, and also the interior of the saw, is left unobstructed, for the purpose set forth.

2. In combination with a cylindrical saw, a secondary cutter, arranged substantially as described, so as to groove the core of the stick while it is being sawed out by the cylindrical saw.

22,841.—*Improvement in Harness Saddle-Trees*, granted to SAMUEL E. TOMPKINS and JOHN MACLURE, February 1, 1859; reissued January 2, 1872, numbered 4,699.

Claim.—A projection attached to the tree passing through a recess in the seat block, substantially as described, in order to take the strain of the bolt passing through such recess from off the seat-block.

22,892.—*Improvement in Mills for Grinding Cane, &c.*, granted to ISAAC A. HEDGES, February 1, 1859.

Claim.—1. Surrounding the openings in the top and bottom plates with annular ledges L, when employed in connection with rollers having recesses corresponding with them in their top and bottom ends, substantially as described.

2. The regulator and adjuster, substantially as and for the purposes described.

3. The oil-tubes H, when used in connection with a recess containing waste oil to conduct the same through the rollers to the bearings below.

4. The corrugated shells, in combination with the rollers, for the purpose of readily converting the mill into a corrugated mill, constructed and adapted substantially as set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 21, 1873.]

6,342.—*Wood Type.*—JOHN F. BLACKMAN, Brooklyn, assignor to VANDERBURG, WELLS & CO., New York, N. Y.

6,343.—*Oil-Cloth.*—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SON & CO., Philadelphia, Pa.

6,344.—*Oil-Cloth.*—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SON & CO., Philadelphia, Pa.

6,345.—*Oil-Cloth.*—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SON & CO., Philadelphia, Pa.

6,346.—*Oil-Cloth.*—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SON & CO., Philadelphia, Pa.

6,347.—*Oil-Cloth.*—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SON & CO., Philadelphia, Pa.

6,348.—*Lamp-Post.*—PETER H. JACKSON, New York, N. Y.

6,349.—*Oil-Cloth.*—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SON & CO., same place.

6,350.—*Oil-Cloth.*—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SON & CO., same place.

6,351.—*Printing-Type.*—RICHARD SMITH, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place.

6,352.—*Carpets.*—BENJAMIN CRABTREE, Jr., Philadelphia, Pa.

6,353.—*Carpets.*—BENJAMIN CRABTREE, Jr., Philadelphia, Pa.

6,354.—*Carpets.*—JOHN DORNAN, Philadelphia, Pa.

6,355.—*Carpets.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CERASE & SLOAN, same place.

6,356.—*Carpets.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CERASE & SLOAN, same place.

6,357.—*Carpets.*—WILLIAM J. HOGG, Philadelphia, Pa., assignor to WILLIAM HOGG, Jr., same place.

6,358.—*Carpets.*—HUGH S. KERR, Philadelphia, Pa., assignor to JOHN GAY, same place.

6,359.—*Printing-Type.*—ANDREW LITTLE, New York, N. Y.

6,360.—*Carpets.*—JOHN POWELL, Kidderminster, England, assignor to HENRY JECKS DIXON & SONS, same place.

6,361.—*Carpets.*—CHARLES RIGHTER, Philadelphia, Pa., assignor to JOHN GAY, same place.

6,362.—*Hinges.*—JOHN B. WHITNEY, New York, N. Y.

6,363.—*Door-Knobs.*—JOHN B. WHITNEY, New York, N. Y.

6,364.—*Door-Knobs.*—JOHN B. WHITNEY, New York, N. Y.

6,365.—*Key-Hole Escutcheons.*—JOHN B. WHITNEY, New York, N. Y.

6,365.—*Casing of Soda-Water Apparatus.*—GEORGE F. MEACHAM, Newton, assignor to JAMES W. TUFTS, Medford, Mass.

6,367.—*Casing of Soda-Water Apparatus.*—GEORGE F. MEACHAM, Newton, assignor to JAMES W. TUFTS, Medford, Mass.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date January 21, 1873.]

1,103.—*Blasting Squibs and Fuses.*—SAMUEL HARRIES DADDOW, St. Clair, Pa.

1,104.—*Umbrellas and Parasols.*—DAWES & FANNING, New York, N. Y.

1,105.—*Cigars.*—F. DE BARY & CO., New York, N. Y.

1,106.—*Printing-Presses, &c.*—JOB C. TRIPP, Fairhaven, Mass., assignor to BOSTON AND FAIRHAVEN IRON WORKS.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date January 21, 1873.]

ORIGINAL PATENTS.

134,964.—*Machine for Sizing Yarn.*—THOMAS ABBOTT, Blackburn, Great Britain.

The shaft that operates the marking and index apparatus consists of two parts held together by a clutch, and which, through the lever, may be disconnected to allow one part of the shaft to be moved independently by a winch, to reset the marking mechanism. The movement of this lever, through the devices enumerated in the second clause, removes from the index-plate the operative-gear, when a spring coiled around its shaft resets the index to the zero-point.

Claim.—1. The shaft, consisting of two sections, d d^*, which may be connected or disconnected, substantially as described, in combination with marking apparatus operated by the section d^*, which extends to the front of the machine, and is provided with a winch, n, or its equivalent.

2. The combination, with the lever f f, of the pin q, slot r, lever s, and slide t, Fig. 3, or other equivalent device, for returning the dial-plate or the index-finger to the "zero" point on adjusting the lever.

3. The combination, with the shaft d^* and lever f, of the finger e and stop p, or other equivalent device, for defining the position of the marking bowl or instrument at the commencement of a fresh beam.

134,965.—*Curing and Packing Meats.*—ISAAC ATKINSON, Hamilton, Canada.

The meat having been treated for about thirty days according to the common mode of salting, is then brushed in cold water, allowed to drain for twenty-four hours, wiped dry, sprinkled with fine ground alum, and packed between interposed layers of paper.

Claim.—Rolling meats in fine-ground alum after being fully salted and washed, and packing with an ordinary sheet of paper between each piece of meat to prevent injurious contact, as and for the purpose specified.

134,966.—*Tuck-Crosser.*—SYLVESTER P. BABCOCK, Adrian, Mich.

By changing the position of the latch, the distance between the ends of the nipping-points may be regulated to suit different materials.

Claim.—The recessed or notched latch I, pivoted to the standard F, as and for the purpose set forth.

134,967.—*Self-Locking Rail Fence.*—ALLEN BAGLEY, Ypsilanti, Mich.

The stakes which carry the rider are supported upon the lower rails. An opening may be made in the fence, and a firm support given to gate-posts by reversing one set of the long rails, interlocking them with the cross-rails.

Claim.—1. The fence described, consisting of the long rails A, short rails B, rail C, stakes G G, and riders D, the stakes G G being supported by the long rails A A, as shown.

2. In a fence of the described construction, the square section formed by reversing the long rails, whereby the same is adapted to support the gate-posts, as described.

134,968.—*Method of Setting Black Diamonds.*—THOMAS W. FAXTER, Chicago, Ill.

Claim.—1. The mode or method of setting or embedding carbon, boart, black-diamond, or equivalent points or tools in holders for mechanical purposes, substantially as hereinabove set forth.

2. The carbon, boart, black-diamond, or equivalent point set eccentric to that part of the stock in which the holder is secured, substantially as described, so that by turning the said holder in the stock the position of the cutting-point with relation to other cutting-points in the same stock may be varied, substantially as set forth.

3. In combination with the stock and the holder in which the black-diamond, boart, carbon, or other equivalent tool or point is embedded or held, an eccentric sleeve or equivalent therefor, substantially as described, so that the holder may be rotated independently of the said sleeve, for the purpose of adjusting the said tool or point to bring either one of its sides or faces to operate on the material to be cut without changing its position with relation to the other points in the same stock, while, at the same time, by turning the said sleeve the point may be adjusted laterally, if so desired, substantially as described.

134,969.—*Hinge.*—SOLON BINGHAM, Saratoga Springs, N. Y.

A ring or flange partially surrounds the hollow end pieces of a hinge, near the ball-tip of each, and this flange works in corresponding recesses in the swinging part of the hinge, the two in combination applying to a reversible hinge that is known as a bayonet-fastening device.

Claim.—The top joint-piece J and lower joint-piece B, provided with the ring or flange A, partially surrounding the same, in combination with the standing part A, swinging part D E having recesses m m, joint-piece B, and rod or pintle b, the several parts being constructed and arranged substantially as and for the purpose set forth.

134,970.—*Rivet-Pocket for Oil-Well Pumps.*—WILLIAM H. BIRGE, Franklin, Pa.

Between the working barrel and the standing-valve barrel is arranged a tube that holds the standing valve upright, and forms a pocket to catch any broken rivets that may fall down the working-barrel.

Claim.—The pocket F formed between the barrels A and tube E, in combination with the barrel B, valve C, seat c, and cage d, substantially as and for the purpose hereinbefore set forth.

134,971.—*Loom-Shuttle.*—FRANCIS BLANDING and ANDREW J. BLANDING, Lowell, Mass.

The spindle is split a part of its length and a sliding wedge arranged to be moved back and forth within it, pressing out the sides against the cop to hold it firmly when the spindle is in position, and withdrawn when the spindle is raised to allow the sides to be pressed toward each other, that the cop may be easily slid on or removed.

Claim.—The combination, with the shuttle-spindle, of the sliding wedge or pin C, so arranged as to be drawn back and forth within the spindle, substantially as and for the purpose specified.

134,972.—*Steam-Boiler Feeder.*—JAMES H. BLESSING, Albany, N. Y., assignor to himself and FREDERICK TOWNSEND, same place.

The feeding-chamber B receives steam from the boiler through pipe E, which terminates at the proper water-level. It receives water through F and discharges into the boiler through K and H. The pipes are flexible, and the chamber B sinks when filled with water and rises after discharge. As it rises the valve closes and the cock s' opens, and the back pressure from the boiler forces a portion of the water retained in chamber J through pipes J' and F and perforated plate, the shower producing a speedy vacuum in B.

Claim.—1. The combination of the valve v applied and actuated, as shown, single gravitating vessel B, arranged and actuated as described, and the pipes E, F, K, and H, with their appropriate valves or cocks, substantially in the manner and for the purpose set forth.

2. The cold-water supply-receiver J, communicating with a gravitating vessel, B, by means of the feed-pipes and a branch pipe, J', which latter is provided with a valve, s', all for the purpose of facilitating the condensation of steam in said gravitating vessel, substantially as described.

3. The cold-water receiver J, for the purpose of retaining some of the feed-water, and allowing the same to be forced by steam from the boiler back into the vessel B, thus producing a vacuum therein, substantially as described.

4. The combination of valves p, j, and s', and their respective pipes, with a gravitating vessel, B, substantially as described.

134,973.—*Fruit-Box.*—EZRA P. BOTHWELL, McArthur, Ohio.

The bottom box has end boards that extend to the top of the crate; then one or more movable boxes or trays are used. The side boards of said trays project at the ends over the end boards of the crate. The top tray has a cover, and nails are driven through the projecting ends of the upper tray into the end boards, which hold the crate and trays securely together.

Claim.—In a fruit-crate, the combination of the bottom box c, having end boards e extending to the top of the crate, with one or more movable trays or boxes, a b, having the side boards p projecting over the end boards e of the bottom box so that they overlap said end boards, and the top tray having a cover, T, all constructed and held together substantially as described.

134,974.—*Newspaper-File Holder.*—WILLIAM BRIGHT, St. Louis, Mo.

The clamp, composed of two bars between which the papers are secured by thumb-screws and nuts, is provided with journals by which it is attached to a desk.

Claim.—The clamp A, consisting of the parts *a a*¹, journals *a*², and set-screws B, in combination with the desk provided with suitable bearings, as described.

134,975.—*Tug-Strap.*—MARVIN CADWELL, Lansing, Mich.

The tug is cast of malleable iron.

Claim.—The hame tug-strap A, having the hook plate *a*, flanged edges *b*, loops *c c*, and hooks B C, as described.

134,976.—*Circular-Saw Mill.*—WILLIAM A. CAMPBELL, Manistee, Mich.

A brake is supplied to the machine, by which the impetus gained by the gearing in sigging, which might carry the carriage further than required, is taken up.

Claim.—1. The feed-shaft F having the double faced friction-wheel I secured thereon, and the friction-clutches J J' sleeved on said shaft and rotating in opposite directions, the clutch-yoke L and lever for moving the same, all arranged and operating substantially as and for the purpose set forth.

2. The arrangement, with relation to the friction-clutches J J', of the pulleys O P Q R and belts O' and S, as shown and set forth.

3. The brakes U U', lever V, links W, rod X, cranked shaft Y, and spring Z, as and for the purpose set forth.

134,977.—*Sleigh-Runner.*—CHRISTOPHE CHENETTE, Manchester, N. H.

The runner is applied to the axle of a carriage when the wheel is removed, so that the carriage may travel on runners instead of wheels.

Claim.—1. The sole C of the runner extended up, around, and over at the rear end, and inserted in the hub A of the runner, substantially as described.

2. The guard G, extending from the fore end of the runner to the outer end of the hub or axle, substantially as described.

3. In combination with the sole C, rail B, and hub A, the hoop-tire H extending entirely around the runner and hub, substantially as described.

4. In combination with the rail and sole, the braces E and F, arranged substantially as described.

5. In combination with the hub A and sole C, the spokes D D, set bracing between the hub and sole, substantially as described.

134,978.—*Grating for Sewer-Inlets.*—HENRY W. CLAFF, Concord, N. H.

The grating proper is elevated upon short supports, to prevent clogging by small rubbish.

Claim.—The grating for sewer-openings herein described, consisting of the ring *a*, supporting-pins *b*, and elevated grating, substantially as specified.

134,979.—*Medicated Candy.*—SIDNEY B. COLTON, Bloomfield, Conn.

The combination of calamus, gum myrrh, and gum guaiacum with each or all of the following essential oils, viz.: Peppermint, cinnamon, sassafras, hemlock, anise, wintergreen, and capsicum.

Claim.—1. The combination of the calamus, myrrh, and guaiac with candy, substantially in the proportions and manner specified, and for the purpose set forth.

2. The combination of the calamus, myrrh, and guaiac and one, more, or all of the essential oils specified, with candy, substantially in the proportions and manner specified, and for the purpose set forth.

134,980.—*Curtain-Fixture.*—GEORGE B. COWLES, Bridgeport, Conn., assignor to WHITE & COWLES, same place.

A pawl is arranged on the outer end of the supporting-bracket, which bears on the spring-roller that engages in slots made in the face of the roller-flange.

Claim.—1. The pawl F, as arranged, or its equivalent, bearing endwise on the roll, by which lateral motion is prevented.

2. The arrangement of the pawl F, ratchet *b* on flange G, shoulder 2, in combination with axle D, secured in standard or its equivalent B by pin E, as described and for the purpose specified.

134,981.—*Thill-Coupling.*—SHRIGLEY J. DIBBLE, Wethersfield, Conn.

Claim.—The combination of the square bolt *c*, the cylinder *d*, the bearing on the end of the strap *b*, made cam-shaped, and the rubber *a*, arranged and operating substantially as described, for the purposes set forth.

134,982.—*Cork-Cutting Machine.*—THOMAS S. DIXSTON, Philadelphia, Pa., assignor of one-half his right to HENRY DIXSTON, same place.

The cork-blanks previously punched out are fed into a hopper, which, at regular intervals, rises up and delivers them to a traveling carriage having rotary gripers. The blanks are then rotated as they travel over the edges of curved knives, to finish them either to a cylindrical or conical form.

Claim.—1. The combination, substantially as described, of the stationary knife or knives to trim the blanks, and the traveling carrier or carriers, to hold them against said knives.

2. The combination, substantially as described, of the stationary knife or knives, the traveling carrier or carriers, and the hopper or hoppers which feed the blanks automatically to said carriers.

3. The combination, substantially as described, of the stationary knife or knives and the traveling carrier or carriers with two or more sprocket-wheels and a chain, which is slack between every two of said wheels, so as to permit said carriers to pause for the purpose of gaining a blank.

4. The combination, substantially as described, of the stationary knife or knives, the traveling carrier or carriers, and the grinding or buffing wheel.

134,983.—*Medicated Paper.*—CHARLES J. EAMES, New York, N. Y., assignor to KIDDER, WETHERELL & CO., same place.

Carbolic acid combined with the pulp previous to making the paper, or the paper dipped in a solution of the acid.

Claim.—A medicated paper prepared substantially in the manner herein described.

134,984.—*Corn-Planter.*—WILLIAM A. EASTIN, Henderson county, assignor to W. L. RANKINS, Paris, Ky.

A hopper, seed-box, and running-wheels are supported by a flat block lying on the ground, its under surface being concave from side to side, with a drill-tooth in the middle. The wheels have only bearing enough to make them revolve the seed-box. It forms the ground into a rounded ridge with a furrow along the middle.

Claim.—1. The tobacco-hill maker A, having a concavity in its lower side, in combination with the wheels F F, axis *e*, and handles G G, substantially as set forth.

2. The combination of the cylinder C *c'*, plate E, axis *c*, wheels F, hopper D, tobacco-hill maker A *a*² *a*⁴, plow B, and handles G, substantially as and for the purpose set forth.

134,985.—*Wood Pavement.*—JOHN Q. FELT, Detroit, Mich.

The blocks are placed diagonally so as not to touch, and the interstices are filled, first, with coarse gravel, into which is poured a grouting composed of hydraulic cement one part, sand four parts, water *q. s.* The whole forms a wood pavement in a solid stone matrix.

Claim.—A pavement composed of the materials described, when laid substantially in the manner set forth.

134,986.—*Hand-Seeder.*—JOHN E. GARSIDE, Hennepin, Ill.

A long tube closed at both ends, divided equally by three lateral partitions, each compartment having another partition perforated in the center. There is one line of perforations along the length of the tube, through which the seed passes by centrifugal force, effected by a winch-wheel and band in a frame slung over the shoulders.

Claim.—In a seed-sower, consisting of a revolving cylinder, A, with closed ends, the combination of the fixed partitions 2 3, intermediate perforated partitions 5 6 7, sliding doors *a*, perforations *a*, fixed ribbed collars E *d* E *d*, circular flanged bearings C C, board B having the pulley of winch *k* arranged so that the band will pass around the cylinder, substantially as set forth.

134,987.—*Wrought-Iron Column.*—LUDWIG HERMAN, Detroit, Mich.

The column is formed of bars of ordinary merchantable iron radially placed in respect to a cylinder, and connected together by stays.

Claim.—An improved iron or steel column, composed of four or more radial bars, A, connected together at intervals by the stays C, substantially as described and shown.

134,988.—*Animal-Poke.*—CURTIS HINMAN, Akron, Ohio, assignor to himself and ROSWELL WILLETTS, same place.

The operating parts are cast in one piece.

Claim.—The casting D, provided with the cross-bar F, projections E E', and N, all cast in one piece, substantially in the manner and for the purposes set forth.

134,989.—*Velocipede.*—JOHN E. HOFFMIER, New Brunswick, N. J.

A stationary or removable seat facing the rear, and situate up on the angular reach of the vehicle.

Claim.—In a velocipede of the construction substantially as herein shown and described, the combination and arrangement upon the inclined bifurcated reach E E of the seat G facing rearward, the latter provided with the side pieces *d d* for adapting it to the bifurcated reach, substantially as herein shown and described.

134,990.—*Washer for Nut-Fastening.*—HARRISON P. HOOD, Indianapolis, Ind.

A circular washer with holes at intervals near its edge, through which nails are driven, the heads impinging against the side of the nut.

Claim.—The washer A provided with the perforations *a a*, substantially as shown and described, and for the purpose set forth.

134,991.—*Ditching-Machine.*—JAMES W. HUMPHREYS, La Fayette, Ind.

The ditching-point is raised and lowered to any desired position by means of the rack, pinion, ratchet, and lever, in the usual manner. The combination of elements named in the claim is for the purpose of adjusting and retaining the chute or elevator at any desired angle of elevation.

Claim.—In combination, the arms S S pivoted to the chute R and to the journals of the sheave-wheel T, the intermediate arms U U provided with key-holes secured to the journals of the sheave-wheel T, and the sheave V, the latter having its bearings in the arms W W pivoted to the chute R and terminating in the curves X X, all in the manner and for the purposes hereinbefore set forth.

134,992.—*Loom.*—LUCIUS J. KNOWLES, Worcester, Mass.

For mending broken warp-threads, they are brought into one plane by means of a hand-bar arranged to raise the free ends of the horizontal vibrating levers of the shedding mechanism, so as to put them in gear with the lifting mechanism, thereby raising all the heddles at once. To lock the pattern-cylinder during the shedding movement, the levers which are not raised by the pins are held down by a hooked arm actuated by a cam. The shuttle-boxes are operated by two compound levers, G, each connected with two separate gear-cranks and vibrating levers. The levers of the box and shedding mechanisms are attached to their fulcrum-rod by an adjustable cap, which holds their slotted ends down upon it. The connection between the shaft of the cylinder and its actuating-gear is broken, when desired, by withdrawing a spring-bolt from an arm on the end of the shaft. The levers actuated by the pins of the cylinder are made with a circular recess so arranged that they will not be immediately lowered when raised into position.

Claim.—1. The combination, with the vibrating levers B, of an elevating bar or plate independent of the pattern-chain, to raise said levers out of connection with the pattern-chain, and place them in gear with the lifting mechanism, for the purposes set forth.

2. The combination, with the free ends of the vibrating levers B, of the slotted plate B', substantially as and for the purposes set forth.

3. The combination, with levers B and locking device *d'* and *e*, of shaft *c*, arm *c'*, and cam *d*, substantially as and for the purposes set forth.

4. The movable cap or lever holder E, substantially as and for the purposes set forth.

5. The combination, with two separate gear-cranks, H H, and their vibrating levers B B, of the compound levers G and the connections *p p*, substantially as and for the purposes set forth.

6. The combination, with the vibrating arms B and their gear-cranks H, of the cogged lifting and depressing wheels C E and angle-levers C', said parts being constructed and relatively combined with each other on the elevated frame D', as shown and described.

7. In combination with the pattern-cylinder B'', the levers B having the curve *l*, as and for the purposes set forth.

8. The combination, with the shaft of the pattern chain or wheel and gear K, of the locking-arm L and its bolt, substantially as and for the purposes set forth.

134,993.—*Die for Forging Frowers.*—CHRISTIAN KONOLD, Pittsburg, Pa.

One part is used for welding and drawing down, another for straightening, and the third for beveling, the blade.

Claim.—The triple-faced dies, constructed as shown and described, for the purposes set forth.

134,994.—*Reversible Curb-Brick.*—EDWARD LINSON, Shoemakertown, Pa.

The side having an extended flat surface is presented to the soft earth, against which it is held by the harder material of the wall or roadway, which is compressed against the more limited flat surface of the opposite side of the brick.

Claim.—The within-described curb-brick, having one flat side of the same extent as the brick, and an opposite flat side of lesser area, and rounded upper and lower edges, as set forth.

134,995.—*Well Packing.*—JAMES H. LUTHER, Petroleum Centre, Pa.

The diameter of the packer is equal to that portion of the well which receives the casing. From the body four fingers project upward along the sides of the well to guide the lower end of the casing to its seat. This seat is a ring of lead inserted in the body of the packer. The lower portion of the body is cylindrical and receives a beveled ring, which is swiveled on it. The space between the body and the swiveled ring is wound with cotton-wicking. The packer being lowered into the well, the swiveled ring rests on the shoulder formed in the well, and the casing resting on the leaden ring, its great weight causes the lower end to embed itself in the lead and form a water-tight joint.

Claim.—1. The combination of the body P of the packer with the movable ring *r* and the elastic packing *w*, arranged and operating as described.

2. The compressible ring *l*, inserted in the top of the packer to form a water-tight seat in the lower end of the casing, as described.

3. The combination, with the packer P, of the arms *a a a a*, for the purpose of guiding the lower end of the casing to its seat, as specified.

134,996.—*Wagon-Body.*—HENRY AUGUSTUS LUTTGENS, Paterson, N. J.

The body is constructed with removable corner-pieces, the sides being sustained by trusses.

Claim.—The combination of corner-pieces C, panels A and B, sill D, truss-bars E F, and upright piece H, substantially in the manner and for the purpose as described.

134,997.—*Hay Raker and Loader.*—FRANK MARION and NICHOLAS E. WILSON, Groveland, Ill.

Curved metallic rake-teeth, with the head thereof pivoted and pressed by a spring, have a wing or beater revolving in the curve to elevate the accumulated hay onto an endless-apron conveyer, whence it is deposited on the wagon.

Claim.—1. The rake-bar C with its teeth *d* having a pivotal connection at each end with braces B B, and provided with raised arms *v v*, in combination with springs *s s*, substantially as and for the purpose set forth.

2. The revolving beater D, draper E, and elevator F, all arranged to operate together by means of the intermediate gearing connected with the driving-gear *m* of wheel *b*, in combination with the rake C *d*, substantially as set forth.

134,998.—*Apparatus for Preparing Waxed Ends.*—WILLIAM MAY, Binghamton, N. Y.

A series of wires are so arranged that strands of thread of different lengths may be drawn from the balls, which, when formed into a "waxed cord," the ends will have the desired taper.

Claim.—The device herein described, consisting of the tablet A, horizontal wires B, perpendicular wires C, springs *s s s*, thumb-screw and stop E, and rubber facing F, all being constructed substantially as and for the purpose hereinbefore set forth.

134,999.—*Attachment for Wash-Boilers.*—REUBEN A. MCCAULEY, Baltimore, Md.

The attachment is formed of a central tube to be placed in a boiler, the upper end of which tube has a pin so that a short tube, with a slot and inclined slots to make it adjustable, can be placed upon it. The upper end of the short tube has a cap, in which are flaring guides and radially-compressed tubes for directing the hot water and steam onto the clothing.

Claim.—1. In an attachment for wash-boilers, the base column B and cap-tube D, made adjustable in length to adapt the device to wash-boilers of different depths, as described.

2. The cap H having interior curved vanes *g*, in combination with the discharge-tubes, as and for the purpose described.

3. In a wash-boiler attachment, the double-vented and oppositely-inclined tubes E *e e* from single openings in the cap, as and for the purpose described.

4. The wash-boiler attachment having its several parts constructed and arranged for joint operation, substantially as herein described.

135,000.—*Sewing-Machine.*—JOHN N. MCLEAN and JOSEPH BENNOR, Philadelphia, Pa.

Machine makes a lock-stitch, completes each stitch separately, and the needle feeds the material. The cast-off rune diagonally across the head at the base of the hook, prevents the loop getting back of the head, and holds it in proper position until it is spread and cast over the bobbin. The arm projecting from the bobbin rests between lugs on the plate to prevent its rotation; the bobbin-thread is led through holes formed in it, and the loop of needle-thread passes up over this arm, giving the loop a half-twist. The head, bobbin-holder, and bobbin are respectively formed with grooves and lugs to confine them in proper working position.

Claim.—1. The rotating tubular head G provided with the hook *g* and the cast-off *r*, all constructed and arranged to operate substantially as described.

2. The lug *n* provided with a recess for the arm *i* of the bobbin-holder to rest in, said lug having a face or bearing at the point where the needle descends to force the thread inward and thus spread the loop, the whole being constructed and arranged to operate substantially as described.

3. The rotating head G provided with the internal groove *p*, in combination with the bobbin-holder L provided with the laterally-projecting lip *o*, substantially as set forth.

4. The bobbin-holder L provided with the internal circumferential groove, in combination with the bobbin M provided with the lip *l*, substantially as described.

5. The take-up, consisting of the arm R pivoted eccentrically on the end of the driving-shaft F, and having its slotted arm connected by a pin, *u*, to the needle-bar, as set forth.

6. A hemmer or other attachment for sewing-machines provided with an inclined arm or stud, *o*², and the hook *y* or its equivalent, whereby it is secured in place, substantially as described.

135,001.—*Method of Purifying Carbonic-Acid Gas.*—ASA P. METZERT, New Britain, Conn.

The gaseous products of combustion are forced through a pipe, to which is admitted a jet of steam, and they are passed either through or in contact with a solution with an alkaline or earthy carbonate, bicarbonate of soda being preferred.

Claim.—1. The method of purifying carbonic-acid gas by bringing the same in contact with an alkaline or earthy carbonate, substantially as and for the purpose set forth.

2. The method of purifying carbonic-acid gas by diffusing steam therewith, substantially as and for the purpose set forth.

3. The method of purifying carbonic-acid gas by diffusing steam therewith, and then bringing the same in contact with an alkaline or earthy carbonate, substantially as and for the purpose set forth.

135,002.—*Rotary Cultivator.*—JAMES W. MILROY, Haywood, Cal., assignor to himself, WM. M. MICHENER, and C. L. HOWARD, same place.

A series of spade-wheels revolving independently on an axle mounted in a frame supported on wheels. The supporting-wheels being attached to arms on the axle and controlled by a lever, the implement can be raised or lowered so as to carry the spades at a greater or less height, as desired.

Claim.—The frame A and axle B, wheels D D', and spindles C C', in combination with the independent revolving plows or teeth I I on the axle, and arranged to be raised or lowered by lever E, all substantially as and for the purpose herein specified.

135,003.—*Hot-Air Furnace.*—DWIGHT B. MONTAGUE, Springfield, Mass.

Air-pipes with numerous branches are located inside the combustion-chamber. A shield or door, having a weighted lever to close it, is placed inside the fuel to prevent escape of dust, &c. A like door is placed in the dust-flue near base of the fuel-chamber.

Claim.—1. The hot-air pipes P' having branches P'', all arranged in the combustion-chamber, and constructed substantially as described.

2. The curtain or fender suspended between the feed-door and the fire, in combination with the lever *t* and weight *t'* whereby it is held in position, substantially as set forth.

3. The dust-flue G having arranged therein the damper *g*, held in position by the weight *g'*, all substantially as set forth.

135,004.—*Hygienic Basin and Steam-Bath.*—EDGAR O. MURDEN, Highstown, N. J.

An oval basin provided with a lip formed with the basin having its lowest part commencing at a point near the bottom and the upper part slightly elevated above said basin. Also, a cover constructed to fit over the basin, leaving the top of the lip open.

Claim.—As a new article of manufacture, the basin A provided with the lip C and cover F, arranged to be used for a water or steam bath, substantially as and for the purpose set forth.

135,005.—*Farmer's Boiler.*—AARON B. NOTT, Fairhaven, Mass., assignor of one-half his right to JAMES E. CARD, same place.

When coal is used as fuel the grate and fire-bridge are employed, and when it is desirable to use wood as fuel the grate and also the fire-bridge J are removed from the fire-chamber so as to leave the entire heating-space free for receiving large logs that may extend the entire length of the ash-pit D.

Claim.—1. The horizontally-divided and upwardly-tapered sections A C and A' C', constructed and put together as herein described and shown.

2. The combination of the depressed ash-pit D and sections A C A' C' with the removable caldron B, and removable grate G, and the removable fire-bridge J, all substantially as described.

135,006.—*Coffin.*—PHILIP E. OBER, Beverly, Mass.

The coffin, which is made of cement or similar material, has two grooves made across its bottom to serve as guides to the ropes and to prevent them from slipping off while the coffin is being lowered.

Claim.—The sarcophagus made with the ledges C C and channels D D arranged in it, and with reference to each other and its bottom in manner as explained and shown.

135,007.—*Sawing-Machine.*—FURNANDO C. G. PAEP, Carter's Creek Station, Tenn.

The levers for raising and lowering the saw are so arranged as to be moved by the foot of the operator without removing his hands from the driving-crank.

Claim.—The saddles J and K, saw I, pin A, spring-boards L and Y, standard B, cord *s*, rollers *f* and *g*, in combination with the frame A, cog-wheels S and T, crank-wheel E, balance-wheel W, connecting-rod H, sliding bar G, and crank X, substantially as and for the purpose hereinbefore set forth.

135,008.—*Self-Acting Spinning-Mule.*—ARCHIBALD PAUL, Cohoes, N. Y., assignor of one-half his right to CAMPBELL & CLUTE, same place.

A rod, endless cord, or wire, arranged lengthwise of the carriage, is provided with a device that traverses along a movable rod or rods arranged lengthwise of the frame and connected with the shipping devices, so that on moving the rod, cord, or wire the second rod is also moved and the carriage then stopped in any position.

Claim.—In a mule or jack for spinning, the movable rod, or its equivalent, arranged lengthwise on the carriage and furnished with a device which traverses to and fro with the carriage along the movable rod or rods, or any equivalent therefor, which control the action of the belt-shipper or device by which the machine is stopped and started, when the whole is so constructed that the movements of the said rod, or its equivalent, on the carriage shall cause the stopping and the starting of the mule or jack when the carriage is at any point whatever in its to-and-fro movements, substantially as described.

135,009.—*Windlass.*—OLIVER REEDER, Baltimore, Md.

A fixed standard or column having an adjustable revolving drum on its top, with a pawl and ratchet, for the purpose of raising oyster-dredges.

Claim.—1. In an oyster-dredge winder, a lower fixed columnar frame, in combination with an upper adjustable frame for the winding devices, substantially as herein shown and described.

2. Within the bearings of the upper frame B, and passing through a winding-drum capable of only a revolving movement, the sliding shaft D, having the driver *d* and disk E, in combination with the pawl F pivoted to the upper frame, substantially as herein set forth, for the purpose specified.

3. In the drum C, the cavity prepared for the reception of the driver *d* and conforming to its shape, and the circular recess of a diameter larger than the greatest length of the driver, as and for the purpose set forth.

4. The crank-sockets *c'*, in combination with the disks E E' and cranks G, substantially as and for the purpose specified.

135,010.—*Draft-Tube for Soda-Fountains.*—RICHARD B. ROBBINS, Adrian, Mich.

A draft tube having side perforations near its closed end and adapted to be attached to the discharge-pipe of a soda-fountain.

Claim.—The improved draft-tube as having two or more perforations near one end, and used substantially as and for the purpose set forth.

135,011.—*Apparatus for Burning Hydrocarbons.*—EDWARD F. ROGERS, Chelsea, assignor to himself, LUTHER L. HOLDEN, and STOUGHTON B. HOLDEN, Woburn, Mass.

The coiled supply-pipe from the oil-reservoir passes through a water-chamber and terminates in a wire gauze or netting filled with a fibrous material to prevent too rapid feeding of the oil. The tube, where it terminates, is surrounded by a perforated jacket, which admits air to the flame.

Claim.—The combination of the oil-reservoir *a*, pipes *b'* *c*, water-receptacle *c*, generator *h'* having the air-ducts *i*, and jacket *l* having the inclined bottom *l'* and apertures *m* therein, all arranged as specified.

135,012.—*Stove-Leg.*—JOHN Q. C. SEARLE, Topeka, Kans.

The inner side of the enlargement of the stove-foot is made with lugs, with spaces between for the admission of lugs on the exterior of a projection on the under side of a stove-plate for locking the feet to the stove. When the feet are detached the projections serve as supports and protect the molding.

Claim.—1. A foot attachment for stoves in which a circular projection or projections on the under side of the plate, a circular enlargement at the upper end of the foot, and lugs upon both the said projection and enlargement, are combined, substantially as herein described.

2. A circular projection, D, on the under side of the bottom plate of a stove, for the twofold purpose specified.

135,013.—*Harvester.*—JOHN F. SEIBERLING, Akron, Ohio.

The reel is supported upon an adjustable lever and has attached to it a rocking-lever, on which is journaled tension-pulleys for the purpose of maintaining uniform tension, while the reel may be adjusted to any desirable height. The rake is driven from the center of the platform, and a stationary shield is employed to protect the gearing thereof from being obstructed.

Claim.—1. The combination of a supporting-fulcrum for the reel-supporting lever and the pivoted guiding-link connecting the reel-post and lever, substantially as and for the purpose set forth.

2. The centrally-pivoted rocking-lever K, constructed substantially as set forth, with two sets of tension-pulleys pivoted thereon, and having an adjustable-link connection with the reel-support, for the purposes set forth.

3. The combination of the sprocket-wheel on the inner end of the main axle, the rake-driving chain, and the sprocket-wheel on the inner end of the rake-driving shaft, which extends beneath the platform, the sprocket-pulley being in or near the line of the hinges of the platform, substantially as set forth.

4. The combination of the jointed rake-stale, the rotating driving-arm P, the connecting-links *r r'* pivoted to the driving-arm and stale, and the guide-cam, these members being constructed and operating in combination, substantially as set forth, to impart the requisite movements to the rake.

5. The combination of the revolving rake-arm and the stationary elastic shield, constructed as set forth, between which and the platform the rake-arm traverses, which shield rises to allow the rake-arm to pass, and then sinks to prevent the mechanism from clogging.

135,014.—*Treating Sugar with Sulphurous Acid in the Vacuum-Pan.*—AUGUSTUS H. SEYFERTH, Brunswick, Germany.

Treating sugar solutions or sirups in the vacuum-pan with sulphurous acid.

Claim.—1. The process herein described for producing a solution of sulphurous acid for use in the treatment of sugar solutions and sirups.

2. The apparatus herein described for producing a solution of sulphurous acid, consisting of the pan A, dome B, cooler C, condenser D, arranged with their respective appendages, substantially as set forth.

3. The subject-matter of the foregoing clause, in combination with the regulator H, as specified.

4. The process herein described for treating sugar solutions or sirups in the vacuum-pan with sulphurous acid, in the manner and for the purpose specified.

135,015.—*Condensing-Tube for Carding-Machines, &c.*—ALEXANDER W. SKINNER, Providence, R. I.

The small tube is for centralizing the roping after passing the cross-bar, so as to prevent its being broken by centrifugal action, and is made adjustable to and from the bar to vary the friction on the roping and thus regulate its size.

Claim.—1. The combination of the tube A with the cross-bar *b'* and tube D, or its equivalent, arranged substantially as described.

2. The combination of the tube A, the adjustable tube D, or its equivalent, and cross-bar *b'*, arranged substantially as described.

135,016.—*Draw-Point for Driven Well-Tubes.*—WILLIAM P. SMITH, New Orleans, La.

Above and below a collar on the draw-point are arranged right and-left handed screw-threads. Upon the left-hand screw-threads is secured a chamfered pipe. To the right-hand screw-threads is secured a ferrule, into which, in case of the draw-point striking a rock or other obstacle, a rod is inserted. The screwing up of the rod unscrews the draw-point so that it can be withdrawn from the chamfered pipe and a drill inserted in lieu thereof.

Claim.—1. The combination of the draw-point A, bearing on its outer circumference the right-and-left hand screw-threads, with the pipe B, which bears on its internal circumference a corresponding screw-thread, all constructed substantially as described, and for the purpose set forth.

2. The combination of the draw-point A with the pipes B E and ferrule or socket C, all constructed substantially as described, and for the purposes set forth.

3. As a new and improved article of manufacture, a draw-point for driven well-tubes, constructed of metal, bearing a right-and-left hand screw-thread on its outer circumference, substantially as described, and for the purposes set forth.

135,017.—*Railway-Car Brake.*—LORENZO STEBBINS, Hinsdale, N. H., assignor to himself and GEORGE P. STEBBINS, Vernon, Vt.

A brake-frame, to which the brake-rubbers are secured, is pivoted to the center bolster. A rock-shaft is provided at the end of the truck, and is connected by toggle-links to the brake-levers. One end of the brake-rod is attached to the rock-shaft, and the other end to a lever which turns on a bolt secured to the center of the car. The brake-rubber is applied directly to the rail instead of the wheel.

Claim.—1. The brake-shoe, constructed as described, with a sole turned up at each end to allow it to be applied when running either way, longitudinal corrugations to allow it to cut into without tearing up the surface of the rail, and a flange to bear against the inner side of the rail, as set forth.

2. The combination of the cranked rock-shaft, the toggle-links pivoted to the cranks of the rock-shaft, the flanged brake-shoes pivoted to the links, the link-rods attached to the shoes and pivoted centrally to the car, and the cross-brace connecting the link-rods, these members being constructed and operating as set forth.

3. The combination of a brake-lever, A, link-rods B B', rock-shafts, links D D', bracing-frames F¹ F² F³, and shoes, substantially as set forth, whereby the brakes are simultaneously brought to bear upon the track outside of the wheels and at each end of the car.

135,018.—*Parlor-Swing.*—BENEDIKT STRÄSSLE, Chicago, Ill.

The seat, front, and side rods being perforated for the suspending ropes to pass through. The upper balls have carved holes in them to act as locks upon the rest.

Claim.—1. In swings, the balls G for the purposes set forth.

2. The combination of the balls G with the cords C, rods D E, and seat A, substantially as described, and for the purposes set forth.

135,019.—*Blackboard.*—THOMAS J. THORP, Buffalo, N. Y., assignor of one-half his right to MARTIN TAYLOR, same place.

Four radiuses of double-leaf blackboards rotate upon a central standard. They are adjustable up and down horizontally to any point of the circle, and the outer leaf is extensible beyond the inner, being hinged thereto.

Claim.—1. The extension blackboard, consisting of a series of boards *f f f f*, hinged to a central revolving post, B, each board provided with a wing, *f'*, all held in place by the adjustable clamp C and set-screws *n p*, all arranged and operating in the manner and for the purpose specified.

2. The adjustable clamping device C, set loosely on the center post B, held at any point of its revolution by the set-screw *n*, and each arm D adjusted or held by its set-screw *p*, in combination with the boards *f* and pins *m*, all constructed as and for the purpose hereinbefore described.

3. Adjusting the folding blackboards higher or lower by means of the center post B, screw-cylinder *b*, and hollow screw *a* forming part of the standard A, and held at any height by set-screw *a'*, as hereinbefore fully explained.

4. The construction of the revolving, folding, and adjustable blackboard, consisting of the boards *f f'* hinged to center pivot B, the clamp C, the standard A, formed with the hollow screw *a*, and having the screw-cylinder *b* thereon with set screws *d d'*, all arranged and operating in the manner and for the purpose hereinbefore specified.

135,020.—*Machine for Carbureting Air.*—JAMES H. VAN HOUTEN, Newark, N. J., assignor to SAMUEL T. TATE, Brooklyn, N. Y., and EDWIN F. VAN HOUTEN, Newark, N. J.

An automatic feed to supply gasoline to the generating-chamber, so arranged that when the oil rises to a certain height a float rises and closes a valve, thereby shutting off the flow of oil to the gas-generator. The carbureting-wheel, constructed in several sections and soldered together, and arranged with a cylindrical wire screen, filled with sponge, inserted in the center of said wheel.

Claim.—1. In combination with the feed pipe *a*, the valve *d*, the same being bushed with glass or its equivalent, and the valve-stem being metal, or vice versa.

2. In combination with the carbureting cylinder B, operating as herein set forth, the float-chamber E, feed-pipe *a*, and equilibrium-pipes *c*, for supplying gasoline through the float-valve F to the chamber B, substantially as set forth, and for the purposes described.

3. The float F, in combination with the feed pipe *a*, when constructed and operating substantially as and for the purposes herein set forth.

4. The wheel C, composed of a series of flues, F, and sections G, and air-drum H, the whole combined and soldered together as herein set forth, and supported by and revolving upon journals I I, substantially as and for the purposes herein set forth and described.

5. The vertical air-inducting pipe D issuing from the top of and in combination with the cylinder B, and made sufficiently high to prevent the escape of vapor, substantially as set forth.

135,021.—*Combined Optic-Table and Bed.*—DAVID WALKER, Newark, N. J.

The top of the table is detachable. In each end of the table-frame are recesses to receive the ends of the mattress when not in use, and the frame is also provided with hinged ends that form the ends of the table-frame when used as a table, but help support the mattress when used as a bed. Underneath the table top is a hinged folding bottom that is spread out the whole length of the table-frame when the device is used as a bed. When used as a bed, the table top is removed.

Claim.—The table A, made convertible into a bed by means of the removable top T, folding bottom *a b c d e f*, and folding ends F F', and provided with recesses for the reception of the ends of the mattress M when not in use, substantially as described.

135,022.—*Harrow.*—JAMES N. WAMSLEY, Galena, Ohio.

There are two triangular frames, one placed within the other, and both furnished with sharp-edged and pointed teeth inclining rearward. The inner frame is supported by the outer by three points of attachment by links at the front and on two sides. Handles are secured to the outer frame.

Claim.—The harrow A A', when constructed as described, with a central section suspended by links B B B, both sections having teeth, as shown.

135,023.—*Self-Acting Dam.*—HERMAN WERNER, Louisville, Ky.

A self-acting dam for use in slack-water navigation. At high water the wings A B C lie flat, a dam not being then needed. At low stages water is introduced through the channel F beneath the wings, which, from their cellular structure, are floated up and assume position, A forming the dam and B the support. The present improvement introduces the "cross-wings" C, by which the escape of water is measurably prevented and very low stages of water utilized. Locks are, of course, brought into play to transfer boats when the dam is in use.

Claim.—The combination of the cross-wings C and C' with the principal wings A and B, substantially and for the purpose hereinbefore set forth.

135,024.—*Hydro-Steam Engine.*—JACOB WIDMER, Bristol, Conn.

Claim.—1. The combination of the steam-chest A, cylinders B B, pistons D D, water-chest C, and pipe *d*, arranged and operating substantially as and for the purpose described.

2. In combination with the subject-matter of claim 1, the water-wheel G, and its reservoir or tank F, all arranged and operating substantially as and for the purpose described.

135,025.—*Soldering-Tool.*—WILLIAM H. WIGHT, Princess Anne county, Va., assignor to himself and GEORGE H. WIGHT, Lowell, Mass.

The aperture G admits air which mixes with the gas before it arrives at the point of combustion in the hollow tool.

Claim.—The hollow soldering-tool A, provided with tube E, aperture G, and plug H, all substantially as described.

135,026.—*Earth-Closet.*—ROBERT S. WILLIAMS, Norristown, Pa.

An earth-receptacle attached to the under side of the lid, one end of the receptacle having a hinged cover for the reception of earth, and the other end provided with a chute, which receives a charge of earth when the lid is thrown into its upward position, and discharges it into the pan when it is brought to its closed position.

Claim.—The combination of the lid A of an earth-closet, and the earth-receptacle B having a door or cover, *a*, at one end, and a chute, *b*, at the other end, substantially in the manner and for the purpose set forth.

135,027.—*Barn-Door Fastening.*—ALAMANDER D. WRIGHT and AUBAN ROUS, Belleville, Mich., assignors to ALAMANDER D. WRIGHT.

An upright bolt, moved by a thumb-latch, is furnished at its upper end with a swinging or pivoted latch, which catches behind lugs upon the upper part of the door-frame. Thus a single movement only is required to lock the door, both at its top and bottom. The thumb-latch is furnished with a notch, which, when the door is thrown open, is automatically secured to a hook upon the side of the bar, for the purpose of holding the door open.

Claim.—The combination of the vertically-moving bolt G and the swinging latch F with suitable catches, the parts operating substantially as described, for the purpose set forth.

135,028.—*Metallic Compound for Coating Cutlery, &c.*—JOHN ZIMMER, Cleveland, Ohio, assignor of two-thirds his right to ROBERT SANDERSON and SAMUEL CUNTS, same place.

Tin, silver, nickel, bismuth, sulphur, sal-ammoniac, mercury.

Claim.—1. The metallic compound, substantially as and for the purpose set forth.

2. The coating or covering articles of cutlery, &c., with the metallic compound herein described, by the means or mode substantially as set forth.

135,029.—*Corn-Sheller Case.*—AUGUST BORNEMAN, Lancaster, Ohio.

Metallic bonnet, having an opening which forms the upper part of the cob-chute, can be removed without interfering with that part of the casing upon which the feed-throat is located.

Claim.—The herein-described shell or casing for a corn-sheller, consisting of the wooden portion B B' B² C and the metallic bonnet I I', substantially as described.

135,030.—*Cigar-Bunch Pressing and Molding Machine.*—WILLIAM D. BREWER, Charlestown, Mass.

A movable guard applied to a cigar mold and press for preventing injury to the hands by the descending die.

Claim.—A finger-guard, E, applied to a machine for pressing and molding cigar-bunches, consisting of a shield which automatically forces the hand away as the die descends, substantially as described.

135,031.—*Retainer for Pressed and Molded Cigar-Bunches.*—WILLIAM D. BREWER, Charlestown, Mass.

The tubular retainer is divided transversely instead of longitudinally, the upper and lower portions being slightly larger than the corresponding portions of the cigar-bunch. The forming of a seam on the side of the cigar is thus prevented.

Claim.—The within-described retainer, consisting of the two transversely-divided portions *a b*, substantially as and for the purpose set forth.

135,032.—*Sewing-Machine for Boots and Shoes.*—WILLIAM DUCHEMIN, Boston, Mass., assignor to himself and GEORGE B. BIGELOW, trustee, same place.

Designed to sew "turned shoes," and an improvement on Patent No. 91,101. The looper has an inclined point and a groove; is held on pins projecting from the reciprocating looper-carriage by a spring, which allows the looper to be moved laterally when an inclined face thereon strikes an inclined pin, in order to expand the loop of looper-thread held by it and taken from the looper, so that the looper will pass anew through its old loop, then in the needle's loop. The upper portion of the shoe-supporting standard is hinged so that it may be adjusted to different shoes, and the wedge which presses the standard up and holds it while the stitch is being formed is governed as to its movement by a spring so that the standard adapts itself to the thickness of the sole. When the needle passes through the material it strikes the under side of the carrier-guide and elevates it and the carrier so that the latter is in proper position to enter the loop of needle-thread.

Claim.—1. The looper c^6, constructed and operating substantially as set forth.

2. The thread-carrier g^9, in combination with the looper c^6, both constructed and operating substantially as set forth.

3. The standard m^2 provided with its hinged upper portion and clamping-screw, or their equivalents, substantially as described.

4. The combination of the wedge a^9, sliding bar a^8, spring a^7, clutch a^6, and actuating devices with the slotted standard m^2, substantially as set forth.

5. The combination of the thread carrier g^9, pivoted in a slot in the face-plate, the carrier guide g^8, and the needle, substantially as set forth.

6. The thread-controller or tension-rod f^1, provided with an angular arm adapted to carry the needle-thread, in combination with its cam f and adjustable stop f^3, substantially as and for the purpose set forth.

135,033.—*Machine for Stretching Hat-Bodies.*—RUDOLF EICKEMEYER, Yonkers, N. Y.

The upper and lower jaws are pivoted to each other where they cross, and the ends of the upper ones are pivoted to the ends of the lower ones. By means of a cam-shaft the two pairs are clamped together and spread automatically.

Claim.—A hat-stretching machine in which the radially-expanding jaws are automatically brought together to clamp and spread to stretch, the body, substantially as described.

135,034.—*Bottle-Label.*—HIRAM FRANK, Pittsburg, Pa.

Claim.—A bottle or jar and label, the latter consisting of a transparent plate with depressed letters or characters in its inner face, such depressions being filled with plaster of Paris or equivalent material and surrounded by a non-transparent and differently-colored composition, substantially as set forth.

135,035.—*Rain-Water Switch and Reversible Valve for Cisterns, &c.*—LOUIS GOUDREAU, Kankakee, Ill.

A box with a central pipe at the top and two pipes below is provided with a pivoted semicircular switch connected to a shaft with a crank on the outside, by which rain, &c., is guided into one or the other of the lower pipes.

Claim.—The arrangement and combination of the partition-plate H with the conduits C and D, and with the switch or reversible valve E, constructed in the manner and for the purposes herein described and set forth.

135,036.—*Valve-Gear for Steam-Engines.*—JOHN W. HACKWORTH, Darlington, England.

Extends the eccentric-rod beyond the pin or part which reciprocates in the changeable path, and the valve-rod is attached to each overhanging end. By this means can obtain, when the reciprocating path is adjusted to be exactly radial to the shaft, the proper amount of motion to allow for lap and lead, and an increase of travel. The toothed rack is connected to the valve-rod, and is operated by a worm-wheel on an upright shaft.

Claim.—The within-described arrangement of the valve rod M, pin *m*, and reciprocating pin D on the eccentric-rod C, in combination with the eccentric *b*, changeable path E, and means for changing the position of the latter at will, as and for the purposes herein specified.

135,037.—*Machine for Turning Wooden Heels.*—RICHARD HÜBLER, New York, N. Y.

A pattern is attached to one end of a revolving spindle, and the piece of wood from which the heel is to be formed is secured to the pattern. The cutting-tool is placed in a slide-rest, governed in its movements by a traveling guide, which bears against the pattern.

Claim.—1. The spindle D, carrying the pattern E, and a device, H, for securing the work against the end of the pattern, said spindle being connected with the driving-shaft C, substantially in the manner shown and described.

2. The tool-rest O and stop Q, in combination with the spindle D carrying the pattern E, and a device for fastening the work against said pattern, and with a screw-spindle, J, which is geared together with the driving-shaft, and serves to impart an automatic motion to the tool-rest, all constructed and operating substantially in the manner set forth.

135,038.—*Machine for Finishing Wooden Heels for Shoes.*—RICHARD HÜBLER, New York, N. Y.

The heel is secured upon an oscillating rest, where it is finished by a rotating cutter of suitable shape.

Claim.—1. The combination of a slide-rest constructed to retain a heel, H, with a cutter, G, a gage, L, and stop *k*, substantially in the manner and for the purpose herein shown and described.

2. The platform K made to swivel on the table A, in combination with the heel-retaining slide-rest and with a gage, L, and stop *k*, substantially as set forth.

3. The arbor F carrying a cutter, G, and connected to the driving-shaft D by a slotted arm, *a*, and hook *b*, in combination with the heel-retaining slide-rest and with a gage, L, and stop *k*, substantially as described.

135,039.—*Graining or Imitating Wood.*—JOHN JOHNSTON, New York, N. Y.

By etching the imitation of wood on glass by fluoric acid the applicant is enabled to transfer the same by means of a roller to any surface where it may be wanted.

Claim.—The process of producing the type of a design for imitations of wood, in the manner substantially as described in my specification.

135,040.—*Lap-Board.*—SARA MAHAN, Cleveland, Ohio.

To each end of the board and near its front edge is hinged a leg, and the two legs are connected together by a rail. An auxiliary leg or brace is also used on the back edge of the board. The legs are held in position by a peculiarly-bent hook.

Claim.—The legs B and G and spring-hook brace D, in combination with the board A, in the manner as and for the purpose set forth.

135,041.—*Harvester.*—JOHN P. MANNY, Rockford, Ill.

The coupling-frame and gear-frame vibrate about different centers and are connected by a link which permits free movement horizontally but retains the frames in the same relation vertically. A laterally-swinging seat is connected by a link to a post in the drag-bar. The finger-bar is hinged to the drag-bar in front of the line of cutters, and may be rocked by a lever extending upward from the shoe.

Claim.—1. The combination of the gear-frame vibrating about the main axle, the drag-bar vibrating about a pivot eccentric to that of the gear-frame, and the horizontally-flexible coupling-arm connecting the gear frame and drag bar, these members being constructed and operating in combination, substantially as hereinbefore set forth.

2. The combination of the gear-frame, the drag-bar, the coupling-arm, and the shoe hinged to the drag-bar in front of the cutters, all these members being constructed and operating in combination, substantially as hereinbefore set forth.

3. The combination of the shoe, the drag-bar, the coupling-arm, the post mounted on the drag-bar, the main frame, and the chain or cord connecting the post and main frame, all these members being constructed and operating in combination, substantially as hereinbefore set forth.

4. The combination of the main frame, the driver's seat oscillating laterally thereon, the hinged finger-beam, and the link-connections between the driver's seat and finger-beam, all these members being constructed to operate in combination substantially as hereinbefore set forth, to secure a uniform relation between the driver's seat and finger-beam.

5. The combination of the drag-bar, the shoe hinged to the drag-bar in front of the cutters, and the rocking arm fixed upon the shoe, all these members being constructed to operate in combination, substantially as hereinbefore set forth, to rock the finger-beam independently of the coupling arm.

6. The combination of the drag-bar, the post mounted thereon, bracket on the post, the shoe hinged to the drag-bar, and the rocking arm mounted on the shoe, all these members being constructed to operate in combination, substantially as hereinbefore set forth, to lock the finger-beam when desired.

7. The combination of the driving-wheel carrying an internal ratchet, the disk fast on the axle and carrying spring-pawls, and the oscillating recessed shipping ring encircling the disks, these members being constructed and operating as described.

135,042.—*Scraping and Loading Machine.*—DANIEL MARRS, Friends' Creek township, Macon county, Ill., assignor of two-thirds his right to HENRY H. MARRS and GRANVILLE B. CARTER, same place.

The machine is drawn forward and the horses released by detaching the pole. The scraper is then let down and the earth is carried up the scraper by an endless apron.

Claim.—The combination of the frame A A, constructed as described, pieces B B, wheels J J D D, rod E, cams *c c*, lever F, and segment G with the scraper H and endless apron I, all arranged as shown and described, and for the purpose set forth.

135,043.—*Inking-Pad.*—JOHN A. MILES, Charleston, Ill.

The upper one of two parts of pad, hinged together at one end, is supplied with ink from a funnel-shaped reservoir, with which it is provided, filled from the inner side, and stippled by rubber in the surface of other part.

Claim.—An inking-pad consisting of the cushion G, reservoir E, distributing perforated plate D, and a closing diaphragm or cover, F, substantially as described.

135,044.—*Construction of Buildings.*—WILLIAM J. MORLEY, Indianapolis, Ind.

A water tight metallic trough, *b*, is suspended between each pair of floor-joists, to save the water from penetrating to the ceiling underneath in case of flooding the floors when a fire occurs. The water is discharged through a pipe, *a*.

Claim.—1. The water-tight fire-proof receiver A placed between the flooring C and the joist D, substantially as and for the purpose herein specified.

2. The combination of the receivers A, the secondary joist B, flooring C, and main joist D, substantially as and for the purpose described.

3. The combination of the receivers A, the joists, the flooring, and the outlet *a*, substantially as described, for the purpose specified.

135,045.—*Limekiln.*—F. WILLIAM RAEDER, St Louis, Mo.

The grate surface widens inwardly. The arch covering it is supported at the inner end by wedge-shaped pieces containing air-channels opening above and below the grate. Similar air-channels are provided at other points, either through the masonry or by metallic tubes.

Claim.—1. The combination of the limekiln with grates gradually enlarging toward the interior and the insertion of a wedge-shaped pier, A, for each grate, for the purposes above described.

2. The combination, in a limekiln, of horizontal and vertical air-passages, acting automatically to regulate the supply of air above and below the grates, substantially in the manner shown and specified.

3. The combination, in a limekiln, of grates enlarging toward the interior, wedge-shaped, supporting-pier, and horizontal and vertical air-passages, the latter acting automatically to adjust and regulate the supply of air above and below the grate, substantially in the manner and for the purpose shown and specified.

135,046.—*Molding-Plane.*—ALEXANDER S. ROBERTSON, Boston, Mass., assignor of one-third his right to JOHN M. BEALS, same place.

The cutting-tool is formed like an ordinary wood-screw, the head being made with a sharp edge. By the thread of the screw it can be screwed into the stock and set at the distance required.

Claim.—1. The cutters C and C′, constructed, arranged, and operating as herein set forth and described, for the purpose specified.

2. In combination with the cutter C or C′, arranged and operating as set forth, the cutter D, constructed and arranged substantially as described.

135,047.—*Sewing-Machine for Boots and Shoes.*—GEORGE V. SHEFFIELD, Boston, Mass.

The thread is drawn through the sole as in ordinary sewing, a hooked needle being used, but the loops are not locked or enchained. The thread is carried by a whirl in the top of the post, and a circular hook surrounding the whirl catches the thread and draws from the bobbin a sufficient quantity to form one-half the staple-like fastening or stitch. The feeding device consists of a spindle provided at its lower end with a punch or awl, *n*, and this spindle is reciprocated in a frame which has a horizontal reciprocation, and the devices employed for giving motions to these parts are mentioned in the fourth, fifth, sixth, and seventh clauses. The nippers grasp and hold one loop or bight of thread while the next loop is being formed.

Claim.—1. The thread-feeding device A′ and rotating thread-carrying plate, combined and operating substantially as and for the purposes set forth.

2. The combination, with the work-table D′, of the tubular shafts 3 and 4 for operating the thread feeding and carrying devices, substantially as and for the purposes set forth.

3. The combination, with the tubular shaft 4, of gear *g*, rack *g′*, lever E, and gear *e″* and its stud *h*, substantially as and for the purposes set forth.

4. The combination, with the slide-frame F′, of the operating-arms G G, substantially as and for the purposes set forth.

5. The combination, with the feed and punch spindle J, stud J′, ring-lever I, and plate K, of cams M M′ and dog 5, substantially as and for the purposes set forth.

6. The combination, with the ring-lever I and punch and feed spindle or arm J, of gear H, flange 7, and cam *b*, substantially as and for the purposes set forth.

7. The combination, with the arms G G and their shaft G′ and cam-plate H″, of pin *k* and gear H, substantially as and for the purposes set forth.

8. The combination, with the punching and feeding devices, of the gage-arm 13, substantially as and for the purposes set forth.

9. The combination of the gage-arm 13 and slide *p*, having the curved part 15, with the cam 14 and spring 16, for the purposes set forth.

10. The combination, with the presser-foot L′, of the nippers 18, substantially as and for the purposes set forth.

11. The combination, with the nippers 18, of the cams 17 and their operating-shaft N, substantially as and for the purposes set forth.

135,048.—*Dredge-Box.*—THOMAS SMITH, Cleveland, Ohio.

A depression is made in the center of the cover, with an opening in the center of the depression. A metallic cap is fitted tightly in said depression, and to the under side of the cap a key is fitted which passes through the opening in the cover. The key prevents the cap from getting detached from the cover, but allows it to stand away from the cover so that the material contained in the box can pass out of the opening.

Claim.—A dredge-box having a recess or cavity, *a*, with an opening, *c*, in the cover or end B of said box, the cap D, and key E, arranged and operating in relation to each other substantially as and for the purpose set forth.

135,049.—*Compound for Paint.*—JAMES S. VOSSELLER, Plainfield, N. J.

Linseed-oil, (raw or boiled,) water, borate of manganese, glue, and pigments, such as lead and zinc, or mineral or earth paints.

Claim.—A compound pigment or paint formed of the several elements and in substantially the proportions hereinbefore described.

135,050.—*Cherry-Stoner.*—DEWITT C. WARNER, Chicago, Ill.

The main part is bent so that the wire forms two prongs and a head, while the third prong is looped over the head and is held between the other two by the coiled wire.

Claim.—The part A bent so as to form an enlarged head, and two prongs, B, in combination with the third prong bent, as shown, to form a loop at its upper end to engage the part A, when the said parts are secured together by a wire fastening placed below the enlarged part A, as described.

135,051.—*Rivet for Boots and Shoes.*—PEMBERT WEST, Worcester, Mass.

The thin piece of metal between the creases *b* keeps the stem whole until the points are driven down on the last, when the stem splits above the last and for the length of the creases.

Claim.—1. A boot or shoe rivet having its point notched and its sides creased, substantially as and for the purpose set forth.

2. A boot or shoe rivet, for fastening the soles to the uppers and for forming upper seams, having its head made with curved points *f f*, and with its point with points *e e*, and its sides creased, substantially as shown in Figs. 1 and 3 of the accompanying drawing.

135,052.—*Nut-Locking Device.*—JOHN WETMORE, Salem, Ohio.

Claim.—In combination with the bolt C, nut C′ having the recess *c′ c²*, and the washer C² having the ratcheted face and spur *c³*, the fish-plate or splice-bar B provided with the ratcheted or milled nut-seat *b*, substantially as described.

135,053.—*Brush.*—JOHN S. WHITE, Portland, Me.

A brush constructed with an inner tube or ferrule, to which the bristles are confined and held by an outer ferrule, leaving the center of the brush open. The inner ring or ferrule extends sufficiently above the end of the bristles to enter an opening or recess in the bottom of the handle, and space is left for a receiver or reservoir for the surplus paint which may find its way into the center of the brush.

Claim.—The combination, in either a round or oval brush, of the handle *d*, ferrule *c*, bristles *b*, and tube *a*, as shown in the accompanying drawing, in the manner and for the purposes as hereinbefore set forth.

135,054.—*Universal-Joint Coupling.*—HENRY B. WHITEHEAD, Holly Springs, Miss.

Hemispherical gears form the contiguous ends of two shafts, which are hung in sleeves, and are combined with slotted pivoted side-plates or links and adjusting-screws, all suitably arranged to permit the shafts to be set at any angle to each other, and yet permit their rotary movement at said angle in like manner as when the same are in alignment.

Claim.—The improved coupling formed of the hemispherical gears F and G, sleeves C D, side links or plates E E provided with slotted segmental projections *d* and set-screws *e*, all constructed and arranged and applied to the shafts A B, as shown and described.

135,055.—*Sail-Hank.*—JOHN G. YOUNG, Jr., Boston, Mass.

Claim.—As an improved article of manufacture, the above-described sail-hank, consisting of the parts *a b*, the bolt B, and turn-button or fastener *c*, constructed, arranged, and applied together, substantially in manner as shown and described.

135,056.—*Eaves-Trough Hanger.*—JONATHAN P. ABBOTT, Cleveland, Ohio.

The supporting-bar has a spur, which co-operates with the finger to form a ready attachment at that extremity, while the button secures the eaves-trough in place.

Claim.—The brace-bar D having a horizontal point or spur, *a*, and finger E, as shown in the drawing and described, and button F, in combination with the gutter A, substantially in the manner as and for the purpose set forth.

135,057.—*Apparatus for Filtering and Rectifying Spirits.*—CHRISTIAN W. ACKERMANN, Pekin, Ill.

The spirits to be rectified pass down through several alternate layers of charcoal and blankets confined between perforated heads and then up through a cylinder filled with cotton batting. The fusil-oil is retained in the upper layer of blankets and charcoal.

Claim.—The rectifier A A, constructed with the collar *d* and flanged head *a* bolted thereto, (the latter pierced with the pipe F,) and filled with several strata of charcoal or rectifiers' coal nearly to the top, each separated by woolen stuff or cotton batting, the whole confined between perforated heads D C, (to rectify spirits in that process in which the latter is passed downward through the filtering medium,) the eduction-pipe E and terminal rectifier F filled with cotton batting confined between woolen material, which batting is again confined between wire-gauze heads or perforated screens *f f*, substantially as described.

135,058.—*Steam Blow-Pipe.*—JOHN S. ANDERSON, Flintville, Wis.

A blow-pipe with two branches is arranged at the rear end of the furnace and communicates with the steam by a small tube. Small perforations are arranged in the branches to blow the fire and scatter the sawdust, when this is used as fuel.

Claim.—1. A steam blow-pipe located directly between the two boilers and behind the fire-front of a furnace, substantially as specified.

2. The steam blow-pipe, consisting of the vertical section E having the diverging perforated branches F, in combination with steam-drum D, constructed and arranged substantially as specified.

135,059.—*Saw-Straightening Machine.*—JOHN S. ANDERSON, Flintville, Wis.

The saw to be straightened revolves on a mandrel between two sets of ways parallel to each other. Two anvils slide on these ways and are adjusted on crossways to the sides of the saw by screws. Blows from a hammer straighten the saw against the faces of the anvils. The whole mechanism, including the saw, can be revolved on a horizontal turn-table.

Claim.—1. A saw-straightening machine having one or more adjustable anvils, substantially as and for the purpose specified.

2. The combination, with a saw-straightening machine, of a turn-table, substantially as and for the purpose set forth.

3. The combination of the longitudinally-adjustable anvils G, movable plates E, ways D, and adjusting-screws H, substantially as described.

135,060.—*Wheel for Vehicles.*—DANIEL ARGENBRIGHT, Tippecanoe, Ohio.

Claim.—1. The radial tongues C C', formed and arranged in the circumferential groove B of a wooden hub, A, when such tongues occupy grooves in the contiguous faces of the spoke-tenons, as herein shown and described, for the purposes set forth.

2. The spokes F, constructed with double taper ends and with longitudinal grooves *f f'* in their faces, as herein shown and described, in combination with the wooden hub A having a circumferential groove, B, and radial tongues C C' therein, and with the metallic band D D' E *e*, for the purpose specified.

135,061.—*Steam-Pump.*—WILLIAM ARTHUR, Newport, Ky.

The water is elevated by a number of steam-jets and number of corresponding water-tubes, through which the water is forced into a common pipe or receiver by the pressure of steam.

Claim.—The combination of two or more steam-nozzles, C, side by side, and a corresponding number of tubes, D, through which the water is forced into a common pipe or receiver, E, by the pressure of steam, in manner substantially as and for the purpose set forth.

135,062.—*Steam-Generator.*—JAMES S. BALDWIN, Newark, N. J.

In a steam-generator, tubes thickened externally and internally; externally for the purpose of forming a collar for clamping devices, and internally for forming a tapered joint with correspondingly hollow-tapered nipples. The tubes retain their maximum strength and set series or rows parallel to each other. The indentations caused by putting the round tubes together is filled in by solid iron rods to prevent the product of combustion from passing through. The hollow nipples or cups above alluded to form a mud-drum, thus forming an economic and simply constructed steam-generator.

Claim.—1. A tube, *a*, thickened externally and internally at each end, substantially as and for the purpose set forth.

2. The tube *a* thickened externally and internally, or externally alone, in combination with the tapering nipples or seats, and suitable clamping devices, substantially as specified.

3. The tubes *a* having the spaces between them closed by small iron rods, substantially as shown and described.

4. The mud-drum *b* and the tube *a* thickened either externally or internally, in combination with the plates *e* and clamps *f*, substantially as set forth.

135,063.—*Combined Blind-Opener and Slat-Regulator.*—ADIN BALL, Milford, Mass., assignor to himself and CHARLES P. NELSON, same place.

A blind-opener, operated by the ordinary scroll-wheel, crank-shaft, and segmental wheel, is combined with a lever pivoted to the lower part of the blind and a spring, and these latter connect with and operate the upright rod of the blind-slats. The outer end of the lever being attached to the slat-rod, its inner end, forced upward by the spring, projects under the last tooth of the segmental wheel in such manner that as the blind closes the forward end of the scroll strikes it and closes the slats. As the blind is again opened the action of the spring, in connection with the lever and slat-rod, opens the slats, thus forming a combined device, partly automatic, for operating both the shutter and the blind-slats.

Claim.—The combination of the lever H and spring I with the scroll-wheel D *d'*, segmental wheel F, crank-shaft C, and slat-rod *b'* of the blind B, substantially as herein shown and described, and for the purpose set forth.

135,064.—*Metal-Turning Lathe.*—ELDRIDGE F. BARNES and GEORGE A. BARNES, New Haven, Conn.

The head-stock of a lathe is pivoted in front to the bed and made adjustable laterally in the rear by means of screws on either side. The outer end, in swinging to the right or left of the central line, tests the axis of the arbor at an angle with the path of the movement of the turning-tool, thus permitting tapered articles to be turned or conical surfaces to be formed.

Claim.—The arrangement of the head-stock of a lathe upon a pivot, *a*, at the forward end, and made adjustable, substantially in the manner described, upon the said pivot.

135,065.—*Tuck-Creaser for Sewing-Machines.*—RUSSEL S. BARNUM, Chicago, Ill., assignor to HARRY C. GOODRICH, same place.

The material passes under the tongues on the spring bar and over the tongue on the plate. The vibrating arm first strikes the outer tongue, presses it and the tongue nearest the gage down on the fabric, holding and drawing it down over the edge of the central tongue, and in this condition the free end of the arm strikes the cloth just beyond the end of the central tongue, crowds it over, and pinches or presses it down against the edge of inner tongue.

Claim.—The combination of the arm E with the plate B, bar D, and tongues *e f g*, arranged to operate substantially as and for the purposes specified.

135,066.—*Pulley-Block.*—EDWARD A. BARRETT, New York, N. Y., assignor to himself and JOSEPH J. WALTON, same place.

A pulley-block provided with a pawl to grasp the chain and hold it in any desired position.

Claim.—A block, A, provided with the perforated rigid arm E, slotted hinged pawl G, eye H, in combination with the chain I and trip-line K, substantially as and for the purpose specified.

135,067.—*Lemon-Squeezer, &c.*—ABRAM BASSFORD, Fort Wayne, Ind.

The lever is hinged to the upright standard, and the presser is hinged to the lever. On the supporting-base of the apparatus is arranged an elastic or yielding cushion on which to place the glass or vessel that holds the fruit to be pressed.

Claim.—The lever *c* and presser *a* hinged thereto, and so constructed as to extend downward into the receptacle *m*, in combination with the elastic or yielding cushion *k*, arranged on the base of the apparatus to support said receptacle, substantially as shown and set forth.

135,068.—*Carriage-Axle and Axle-Box.*—BAYARD A. BERRYMAN, St. Louis, Mo.

The oil is poured in through the hole *g*, and, if in sufficient amount, most of it flows down the grooves *c* to reservoir *h*, from whence, when the wheel is in motion, it is supplied to the spindle.

Claim.—1. The fixed collar E shrunk into a circumferential groove in the axle and forming an abutment for the collar F to retain the wheel, as described.

2. The loose collar F, confined between the customary "lutting-ring" or collar B and the fixed collar E, as set forth.

3. The chambered cap H, covering the end of the spindle, screwed into a female thread within the end of the box and provided with a shoulder, *h*, to retain the hub, all as specified.

4. An axle-box and axle combined, having the fixed collar E, movable screw-collar F, grooved spindle C *c*, box G, chambered cap H, oil-hole *g*, and plug *g'*, all constructed and arranged to operate as set forth.

135,069.—*Wash-Boiler Attachment.*—HENRY BICKEL, Myerstown, Pa.

A plate of an oval form rests on a rim of the same form. The center of the plate is cut away and longitudinal bars put in the opening, and under these is a plate or dish secured to the top plate, with perforations in the ends. Tubes project from the ends of the oval plate, and they have a number of jet-tubes at the upper ends.

Claim.—The attachment for wash-boilers, herein described, consisting of the bottom plate A having the central opening C, and covered by the longitudinal bars D, and plate E and bent tubes D' with the jet-tubes *d*, substantially as specified.

135,070.—*Cultivator.*—CEALY BILLUPS, Norfolk, Va.

A slotted and corrugated wedge is interposed between the under side of the beam and standard by means of which the pitch of the plow can be varied. The lower end of the standard is provided with a pair of wings or scrapers, which are also adjustable to various heights.

Claim.—1. A slotted wedge, E, having the flanges *e e* and *e' e'* upon its opposite sides, applicable as and for the purpose described.

2. A cultivator-plow sweep having the shank *a* with hole *d* and stud *d'*, constructed substantially as and for the purpose described.

3. The standard C, having parallel pairs of holes *e e'* and intermediate slots *e''*, as described, to enable the sweeps to be either raised or depressed, and also allow their pitch to be changed.

135,071.—*Spool-Box.*—JULIUS C. BOHN, Centralia, Ill.

Having adjustable partitions and a tension-bar.

Claim.—1. The new article of manufacture consisting of a thread-box with changeable partitions B and the notches D, all constructed and arranged substantially as specified.

2. The combination of the tension bar F with the thread-box, constructed as above described.

135,072.—*Oil-Dripping Can.*—LEWIS R. BOYD, New Brunswick, N. J.

Claim.—1. An oil-can perforated at a point adjacent to the nozzle, as set forth.

2. The air passage or vent formed in the screw-cap by indenting that portion of the nozzle continued within the cup, as specified.

135,073.—*Crank Movement.*—HORACE C. BRADFORD, Providence, R. I.

The automatic reciprocating crank-arm, the center pin, and face-plate are connected with the semi-elliptic bearing, which constitutes the connecting medium between the crank-arm and the face-plate.

Claim.—The combination of the semi-elliptical auxiliary bearings *f h* with the rotary face-plate, the automatically-reciprocating crank-arm, its center-pin, and steady-pin, substantially as and for the purposes specified.

135,074.—*Safety Apparatus for Lamps.*—CLARK J. BROWN, Plymouth, N. H.

Constructed of a funnel, by means of which the lamp is filled from the oil-can by means of tubes.

Claim.—1. The combination of the flexile tube D and the stationary tubes C E with the funnel A and cork or stopper F.

2. Also, the combination of the hooked bail B, or its equivalent, the funnel A, the cork F, and the stationary and flexile tubes C D E, all arranged substantially as and for use as specified.

135,075.—*Check-Hook.*—HENRY W. BURRESS, New Brighton, assignor to himself and H. EATON SHERMAN, Pittsburg, Pa.

Claim.—The check-hook *a a* having its spring *c* secured to the point *b* and opening inward, with a recess, *g*, in the head of the bolt *f* for the reception of the detached end of the spring, as herein described, and for the purpose set forth.

135,076.—*Hoe.*—HARRY CAMP, Covington, Ky.

Claim.—As a new article of manufacture, the rectangular hoe-blade A, having two adjacent edges curved and the other two plane or flat, substantially as specified.

135,077.—*Medical Compound for Cure of the Catarrh.*—JOSHUA A. CARPENTER, Waverly, N. Y.

Oil of tar, gum camphor, salt, (chloride of sodium,) glycerine, and water.

Claim.—The ingredients herein specified, combined substantially in the manner and about the proportions set forth.

135,078.—*Tuck-Creaser.*—WILLIAM CARPENTER, Lawrence, Kans.

The sliding bars, provided with the nipping jaws, are moved in opposite directions and caused to crease the fabric elevated by the ribs by means of pins on the rocking shaft that enter holes in the bars.

Claim.—1. The perforated sliding bars G G provided with spring *d* and jaws *f f*, and operated from the needle-bar of the machine by the lever E, rocking shaft D, and pins or lugs *e e*, substantially as and for the purposes herein set forth.

2. The combination of the bed-plate A with edges or ribs A A, gage B, plate C with ears *a a*, rocking shaft D with pins or lugs *i i*, arm E, spring *b*, and perforated sliding bars G G with spring *d*, and jaws *f f*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

135,079.—*Corset-Steel.*—CHARLES S. CHAFFEE, Birmingham, Conn., assignor to ROBERT N. BARRETT, same place.

Two or more strips or wires form the edges of the corset-spring, and are covered, when a third strip or steel is placed in the recess between them.

Claim.—A corset-steel having the outer or edge portions inclosed within a covering, the said covering forming a web longitudinally through the space between the said outer portions, leaving a recess between the said edge portions into which the center spring *c* is placed, substantially as described.

135,080.—*Writing-Pen.*—RICHARD H. CHIEN, Washington, D. C.

The back of the pen writes as freely as the front, the ink is agitated and flows freely, and spring and elasticity are added to the pen.

Claim.—The point A of the pen, having openings C and D at each end of the slit B, an angular bend, H, across the point and slit, and the curved tongues J J on each side of the bend H, and the gutter P at the back of the point, when constructed and operating as herein described, and for the purposes set forth.

135,081.—*Calk for Horseshoes.*—THOMAS M. CLARKE, Winsted, Conn.

The hole through the calk is designed for a pin to be driven through it and into the shoe to hold them together temporarily for heating and welding.

Claim.—As an article of manufacture, the herein-described toe calk, having one or more perforations vertically, or nearly so, therethrough, substantially as set forth.

135,082.—*Railroad-Rail Joint.*—JAMES M. CLEM, Opelika, Ala.

The bolt is confined by a spring-washer and vertical notched key, which, in case of becoming loose, is replaced in position by the flange of the passing wheel.

Claim.—The horizontal flat bolt C combined with a vertical notched key, E, held by a spring-washer, as and for the purpose described.

135,083.—*Oyster-Packing Can.*—LEVI R. COMSTOCK, Baltimore, Md.

A sheet-metal can, having an inner flange extending up parallel with its walls, and being provided with a suitable cover, is inclosed within an outer case, which is so constructed that the same may be securely locked by a suitable device arranged for that purpose.

Claim.—1. The combination, with a can and cover having a vertical flange, *b*, of an inner wall or flange, B, secured to the can-wall and forming an annular space, *c*, to receive said flange *b* of the cover.

2. The combination, with the case D, of the crossed suspension-bars A and metallic ring *u* having the handles G, substantially as specified.

3. The combination, with the case D and cover E, of the ring F carrying the bolts *s*, designed to be inserted through the case into cover, substantially as specified.

135,084.—*Wrench.*—EDWARD A. COOPER, Lancaster, N. Y.

By slightly pressing inward, the flange or lip *c* is kept in contact with the top of the nut and prevents the wrench from slipping past the same, thereby retaining the jaws of the notch in their proper position with reference to the nut.

Claim.—A wrench constructed with a flange or lip, *c*, arranged so as to partially obstruct on one side of the wrench the notch or recess which receives the nut and prevents the accidental displacement of the wrench, substantially as herein before set forth.

135,085.—*Feeding-Screen for Bran-Dusters.*—GEORGE S. COOPER, Baraboo, Wis.

Feeding-screen supported at each end on adjustable spring-pieces, and reciprocated by eccentric working in a yoke.

Claim.—1. The combination of yoke G I, brace K, slotted springs E F, adjusting-bolts Q', and the feed-shoe hinged to said springs, as shown and described, whereby the shoe may be reciprocated and vertically adjusted at either or both ends, for the purpose specified.

2. The spring-supports F for the lower end of the shoe having the bow Q, as specified.

135,086.—*Spring Attachment to Car-Windows.*—GEORGE CORNWALL, Brooklyn, N. Y.

The springs are adapted to keep the sash out of contact with the casing on either side, and serve as handles for raising and lowering the sash.

Claim.—The arrangement of the bow-spring C with the sash A and casing B, as shown and described, whereby it prevents rattling, and also serves the purpose of a handle, as specified.

135,087.—*Manufacture of Jewelry-Bases.*—SHUBAEL COTTLE, New York, N. Y.—Case C.

An annular disk, integral with a flange turned at right angles thereto along its outer edge, has an inner rim or flange formed upon it by placing it upon and around a recessed mandrel and spinning the inner edge of the annulus over against the wall of the recess.

Claim.—1. The mandrel D, having edge *d'* and cavity *d*, constructed as described, and combined with a burnisher and ring, as and for the purpose set forth.

2. The method of forming on the blank A an inner barrel, C, concentric with outer barrel, substantially as described.

135,088.—*Manufacture of Jewelry-Bases.*—SHUBAEL COTTLE, New York, N. Y.—Case B.

An annular rim, integral with and springing from and at right angles to a flat disk, has its edge turned over inwardly, (as at *b*,) by placing the disk in a ledge in a recess of a mandrel, the edge of the rim projecting above the wall of the recess, and, with a blunt tool, spinning the margin of the rim inward until it is brought to a plane parallel to that of the disk.

Claim.—1. The mandrel having cavity *c* and ledge *c'*, combined with a burnisher, as and for the purpose described.

2. The method of forming the flange *b* on base B, substantially as described.

135,089.—*School-Desk.*—SYLVANUS COX and WILLIAM W. FANNING, Richmond, Ind.

The end frames of the desk are provided in their central portions with a circular recess having two steps or cushions on one side, and are connected by a bolt with a boss on the seat-arm, which has steps or projections that work in the recess in the desk-frames.

Claim.—The described arrangement of seat-frames *F F'* having the bosses H H' and bolts E E' connecting them with the central intersecting portions of the standards A A', in the described combination with the circular grooves or cavities C and steps G G', I I', as and for the purpose set forth.

135,090.—*Handle for Brushes.*—ROBERT S. CRAIG, Cincinnati, Ohio.

A broom or brush head, on which is firmly held a plate with a projecting center or lug, to which is connected, by pivot, a swinging yoke, through which passes a screw-bolt connected by a nut in the handle which passes through the yoke, and its point resting upon or in a slot in the projecting center or lug, that the brush or broom may be held at a proper angle for its use.

Claim.—The combination of plate B *b'*, swinging adjustable yoke C *c*, and set-screw handle D *d*, connected and operating substantially as and for the purpose specified.

135,091.—*Steam Water Elevator and Injector.*—ALONZO W. CRAM, Litchfield, Ill.

A tapering nozzle or siphon-tube is provided with a series of steam-jets to contract, and thereby increase the power correspondingly, and cause the water to flow with greater velocity and intensify its current.

Claim.—An injector consisting of the tapering or cone-shaped pipe A and a series of steam-jets, *a b c*, the whole being constructed and arranged to operate substantially as described.

135,092.—*Key-Check.*—JAMES J. DE BARRY, Chicago, Ill.

The pointers, connected together by a sleeve, nut, and screw, are set opposite the hour of return on one face, and the place at which the person occupying the room indicated by the number on the check may most likely be found, said check being provided with spurs to prevent its being carried in the pocket.

Claim.—A key-check provided on one side with a dial and a pointer, and on the opposite side with words or other characters and a pointer, as described, both pointers being connected together, substantially as set forth.

135,093.—*Trace-Buckle.*—MANUEL P. DE SILVA and GEORGE T. BENJAMIN, Cleveland, Ohio.

The device is an improvement on Patent No. 123,060, and consists of a plate or thumb-piece attached to or forming part of the cam. The plate has a straight rigid tongue on its under side at its outer end.

Claim.—The plate D with its outer end turned up, and a straight pin, *b*, formed on its under side, when said plate is used with an eccentric-pivoted roll, C, substantially as set forth.

135,094.—*Means of Operating Ships' Pumps.*—SPENCER R. DEVERELL, Mount Gambier, South Australia.

A heavy weight is suspended from a rocking shaft, which shaft is journaled in a rocking frame, and these parts are so connected by bevel-gearing, ratchet-wheels, and pawls to a main working-shaft, that the oscillations in any direction of the weight give a continuous motion in one direction to the said working-shaft.

Claim.—The frame *x x* primary axis *c c* supported in bearings *v v*, secondary axis *b b*, and oscillating weight R, in connection with the shafts *d q*, wheels *g h n o p*, and pawls *m* and *t*, the whole constructed and operated to give rotation of a shaft in one direction, as and for the purpose set forth.

135,095.—*Stove-Grate.*—EZRA DEWITT, Belvidere, N. J.

The two sections of the grate are pivoted at their adjacent edges. The outer edges are operated by cams on the shaft beneath. The opening between the two sections is covered by a guard-plate.

Claim.—The combination of the sectional vibratory gratings D E, pivoted at their adjacent edges, with the cam shaft D', eccentrics F, and central guard-plate or bridge Z, substantially as specified.

135,096.—*Stove-Grate.*—EZRA DEWITT, Belvidere, N. J.

In dumping, both grates are cleared of their loads, that which is between the gratings passing freely out between the perimeters.

Claim.—The combination of the lower circular dumping-grate A, the intermediate collar or washer *a*, the upper horizontally-rotating grate B, and the elongated central pivot-pin C, arranged to allow the upper grate to rise as obstructions increase between the said grates, substantially as described.

135,097.—*Corset.*—STEPHEN DIXON, Nottingham, England.

A corset having thin strips of cork sewn in between the fabric.

Claim.—As a new article of manufacture, a corset or stay having incorporated with it or attached to it thin strips, bands, or sheets of cork, for the purpose and substantially in the manner described.

135,098.—*Corn-Planter.*—STEPHEN DIXSON, Roseville, Ill.

A rearward continuation of the tongue beyond the axle-tree forms a frame, beneath which a front tool cuts off a superficial slice of the ground and throws it beyond the furrow; the furrower follows, and then the seed-drill with a conducting-tube above it. On each side of the drill is a shovel to loosen the soil. Hinged behind the frame, mounted on a roller, is the hopper, which has revolving in it, by a belt and drums, seed-cups on the ends of radial arms, each in turn delivering its contents into the seed-conductor.

Claim.—1. The combination of plows G J J, cutter H, and shoe I, for preparing the soil for the reception of the seed, in manner specified.

2. The combination of plows G J J, cutter H, and shoe I, duct L, seed-box M, cups S, and roller N, when arranged for joint operation, in manner set forth.

135,099.—*Scroll-Saw.*—WILLIAM H. DOANE and WILLIAM H. DOANE, Cincinnati, Ohio, assignors to J. A. FAY & CO., same place.

A brake is attached to the belt-shifter in such a manner that shifting the belt to the loose pulley applies the brake to the periphery of the crank-wheel. The lower guides are also made laterally adjustable.

Claim.—1. In combination with the frame A *a'''* and driving shaft and pulleys C *e* D D', the shifter-rod and wedge-brake E *e' e''*, substantially as and for the purpose described.

2. The slide F when formed by the combination of grooved slides *f'* and inserted web *f''*, connected substantially as and for the purposes specified.

3. The combination of swiveling guide G, rod I, washer *i*, adjusting-nut K, and spring J, substantially as and for the purpose specified.

135,100.—*Sewing-Machine Cover Hook.*—JOHN C. KOLY, Philadelphia, Pa.

The hook-fastening for the cover is adjustably secured so that if the wood of the cover or of the table should shrink or warp it may be adjusted to the change. The hook is secured to a plate which adjusts by slots through which the fastening-screws pass. The hook is in a recess in the table, and over it is placed a slotted plate through which it projects.

Claim.—The adjustable hook C, arranged in combination with the slotted fastening-plate *d*, substantially as and for the purpose herein shown and described.

135,101.—*Turn-Table.*—JOHN ENRIGHT, Cleveland, Ohio.

The table is mainly supported on the central pivot, while the flange *b'* and lubricated groove *a* steady its movements. Dust is measurably excluded by the outer flange *b*, while the inner flange is intended totally to exclude it from the pivot. The pivot-cup is chamfered away at the top, as well as groove *c*, to allow room for a quantity of oil.

Claim.—1. A rotary table, B, having a spindle, *b'*, rotating in a step, *c'*, of bed C, and a flange, *b'*, rotating in a groove, *c*, of said bed, as and for the purpose described.

2. The step *c'* and groove *c*, enlarged so as to receive lubricating material to last, as described.

135,102.—*Machine for Cold-Rolling Sheet Metal.*—JAMES EVANS, Portsmouth, Ohio.

A series of five or more cylindrical rolls of equal diameters, resting horizontally one upon another. Power is applied to the the lower roll, while the others are driven by friction from it. Adjustable weighted levers hold the lower roll of the two being used against the sheet. When a roll becomes worn it is renewed by being placed higher up in the series, where it will receive the friction of two rolls.

Claim.—1. The arrangement, substantially as described, of a tier of five or more interchangeable rolls resting upon one another, and all propelled from one of them by simple friction of their peripheries, as and for the purpose set forth.

2. In the described combination with the vertical range of horizontal rolls resting one upon another, the cheeks C, saddles I, rider J, yokes L, hooked lugs M, and weighted levers N, or their equivalents, for the purpose set forth.

3. The supplementary loading devices I' L' M', as and for the purpose represented.

135,103.—*Damper-Regulator.*—BENAIAH FITTS, Worcester, Mass., assignor to UNION WATER-METER COMPANY, same place.

An automatic damper-regulator operated by two piston-heads belted together, between which one end of a tubular diaphragm is secured, and the other end is fastened between two flanges above and outside of the cylinder, said diaphragm allowing the piston to move up and down, and at the same time prevents the fluid from being forced out the top of the cylinder, while the piston operates the damper in the flue through springs and levers. The damper is also manipulated by a peculiar hand mechanism.

Claim.—1. An automatic damper-regulator, consisting of a water-chamber, S, pipe T, water-channel P, cylinder A, piston B F, diaphragm G, and weighted lever C, the whole being arranged and operated in the manner substantially as described.

2. The combination, substantially as described, of a damper, E, in the smoke-flue of a chimney, or its equivalent, with the devices set forth in the first claim.

3. The combination of the hand-levers M N, catches *v*, standards *r*, and flexible connection *w* with the crank-lever I of the damper E, for the purpose set forth.

4. The combination of the damper E with the crank-lever J, slotted rod K, spring *l*, and weighted lever C of an automatic regulator, for the purpose set forth.

5. The combination of the devices set forth in the third claim, or their equivalents, with the crank-lever J, slotted rod K, spring L, and weighted lever C of an automatic regulator, for the purpose set forth.

6. The tubular diaphragm G, connected to the piston F and cylinder A, as and for the purpose set forth.

7. The water-chamber S, when constructed with an enlargement at top, and arranged to operate substantially as shown and described, for the purpose set forth.

135,104.—*Water-Elevator.*—THOMAS FOWLDS, Jr., Trevorton, Pa., assignor of one-half his right to JOHN H. GABEL, same place.

The exhaust steam is condensed in the receiving-pipe of the pump and, by creating a vacuum, assists in elevating the water, and is more especially adapted to mines, &c.

Claim.—1. The pipe *c*, provided with the stop-cocks *c 2*, so as to exhaust into the air or the receiving-pipe of the pump, substantially as shown and described.

2. The combination of the cylinder *c*, exhaust-pipe *c*, and pump *i*, constructed and arranged to operate substantially as specified.

135,105.—*Steam-Boiler Furnace.*—CHARLES H. FOX, New Orleans, La.

The suspended or supported deflector is perforated so as not to retard the draft too much, and at the same time imparting its heat more readily to the boiler.

Claim.—1. The perforated, suspended, or supported deflector D, in combination with a boiler, A, substantially as and for the purpose herein set forth.

2. The combination of the perforated deflector D, boiler A, and concave arch F, arranged substantially as shown, and for the purposes herein set forth.

135,106.—*Steam-Boiler Furnace.*—CHARLES H. FOX, New Orleans, La.

The deflectors are supported by columns or pillars instead of pipes, as heretofore, to avoid possibility of falling in case pipes are burnt.

Claim.—1. The deflector E, in combination with the columns or supports F, when arranged substantially as and for the purpose set forth.

2. The arrangement of bridge-wall D with the deflector E, columns F, and curved floor G, all constructed substantially as shown, and for the purpose specified.

135,107.—*Clothes-Drier.*—ERASTUS S. FRENCH, Westminster, Mass., assignor to FREDERIC S. COOLIDGE, same place.

A clothes-drier, constructed with uprights or supports, on the top of which are side pieces, through which are pivoted bars for the clothing to be dried upon, and when not in use are arranged to be folded or contracted to occupy very small space.

Claim.—1. The clothes-rack having the side pieces A, pivoted supports B, rigid frame F with double-beveled ends, pivoted frames E with single-beveled ends, and the pivoted outer frames D, all arranged substantially as specified.

2. In a clothes-rack having the pivoted supports B, side pieces A, and pivoted frames D E, the rounded projecting outside the pieces A and serving as stops to the supports B, substantially as specified.

135,108.—*Packing Box.*—LUDOLPH A. FULLGRAFF, New York, N. Y.

The sides and ends of the box are made of wood, with a rabbet around the upper edge. The bottom and cover are made of stout paper, the cover made to fit in the rabbet and the outside flush with the box.

Claim.—As a new article of manufacture, the packing-box herein described, formed of the wooden body and paper cover and bottom, as specified.

135,109.—*Automatic Dental Drill.*—MARION I. GALLAGHER, Savannah, Ga.

The drill for use in the mouth is operated by a band passing over a pulley, which is driven by a spring and gear-wheel. A brake is applied to the periphery of the pulley-wheel, and may be used either in checking or entirely stopping the revolutions of the drill.

Claim.—1. In a hand dental drill for the purpose specified, the spur-wheel C', spring B, pawl and ratchet *a b*, winding-arbor C, the belt-wheel F, pinion D, belt H, pulley I, and drill-spindle G, each part being constructed and arranged in respect to each other, within the case A, as herein shown and described.

2. In a hand dental drill for operating upon the teeth while in the mouth, the lever K, formed as described, pivoted within the case for controlling the movement of the belt-wheel, substantially as and for the purpose specified.

135,110.—*Device for Making Cigarettes.*—HUGO GERIKE, Berlin, Prussia, assignor to BRUNO HARRASS, Böhlen, Germany.

A tube and revolving spiral blade are arranged in a tobacco-pouch. The wrapper is slipped on over the tube and stopper, and is carried along by the stopper as the filling by the spiral advances. To the stopper is attached a spindle, which enters the center of the spiral and guides the outward rotary movement of the cigarette while being formed.

Claim.—The cigarette-filling apparatus, composed of the receptacle B, rotary spiral blade S, tube R, needle N, and stopper K, all arranged substantially as herein shown and described.

135,111.—*Lasting-Machine.*—CHARLES W. GLIDDEN, Lynn, Mass.

The last, with the upper drawn over it, is held rigidly by means of plates, which gripe it just below the plane of the top surface. A series of slides attached to a series of plates, which receive motion from a ring which has limited rotary movement, and as the ring is turned in one direction the slides are moved laterally, thereby forcing the projecting edge of the upper over upon the outer surface of the inner sole.

Claim.—1. In combination with the last-holding jack, the plates *l* simultaneously opened and closed, substantially as described.

2. In combination with the pressers *r* and bars *y*, springs *d''*, against the stress of which the pressers may yield vertically, substantially as described.

135,112.—*Hat-Stretching Machine.*—SAMUEL GOODMAN, Natick, Mass.

Improvement on 46,553, for 1865. The jaws of the radially-arranged stretching-arm are spring-seated, to provide a yielding pressure.

Claim.—A jaw, B, for hat-stretchers having a curved convexity on its working-face, and on its rear-face end a spring rod connecting it with arm A, as described, so that the hat may be stretched from the tip downward.

135,113.—*Compound for Fish-Baits.*—SAMUEL A. GOODMAN, Jr., Jamestown, Tex.

A composition of vegetable and animal matters is mixed with ordinary bait.

Claim.—A mixture or compound of the substances herein specified, substantially as described, and the combination of the same with the ordinary bait or with nets for fishing, as set forth.

135,114.—*Nail.*—WILLIAM N. HALL, Mexia, Tex.

Two sides of the nail are beveled to form sharp edges about two-thirds of its length, where a second bevel is commenced to form a chisel-point at right angles to the sharp edges.

Claim.—The nail, substantially as herein described, as a new article of manufacture and trade.

135,115.—*Door-Check.*—ALEXANDER HANNA, Dover, Ky.

A double-hooked plate, one arm of which is shorter than the other, projects outward from the wall and drops into a recess between two shoulders on the bracket to which it is pivoted. This bracket is hinged to swing up against the wall when the hooked plate is not in use in holding the door.

Claim.—1. The notched or double hooked plate A with arms C and D pivoted to the bracket B and fitting into a recess between the shoulders E and F and arranged relatively to the door, substantially as specified.

2. The bracket B jointed at H, as described and arranged, for swinging up against the wall carrying with it the notched plate A, substantially as specified.

135,116.—*Sad-Iron and Fluting Iron.*—JOHN HEWITT, New York, N. Y.

A sad-iron constructed with two polished surfaces is attached, for fluting, to a corrugated plate by a stud and screw, (by which it is easily detached,) the corrugations extending through its length, of uniform dimensions.

Claim.—The reversible iron A and the detachable corrugated plate F, when the same are constructed, combined, and arranged to operate substantially as described.

135,117.—*Cradle.*—LEVI HEYWOOD, Gardner, Mass., assignor to HEYWOOD BROTHERS AND COMPANY, same place.

A cradle constructed of wood, supported by upright ribs, with a supporting edge or cap, all from pieces bent to form, and attached together by screws or rivets.

Claim.—A child's cradle, having the body thereof constructed wholly of bent strips or frames of wood, in the manner and for the purposes described.

135,118.—*Writing-Pen.*—JOHN HOLLAND, Cincinnati, Ohio.

A pen having fluted sides for conducting the ink supplied from a fountain formed by piercing it transversely with intersecting holes.

Claim.—The grooved and perforated detachable metallic point C *c' c''*, substantially as and for the purpose specified.

135,119.—*Wheel for Vehicles.*—JEREMIAH C. HURLEY, Cincinnati, Ohio.

Claim.—The spoke having its inner end tapering and provided with the slot G, shoulder A, and passage H, in combination with the hub-band C having the radial partitions D, substantially as specified.

135,120.—*Vault-Light.*—THADDEUS HYATT, New York, N. Y.

Claim.—A vault-cover, sidewalk, floor-light, &c., composed of metal and glass in which the glass panels are provided upon their upper surfaces with a plurality of bearing and light-refracting points of considerable elevation, and the supporting frame has channels which permit water falling upon said panels to flow away and dirt or dust to be blown or swept away, substantially as and for the purpose specified.

135,121.—*Sewing-Machine-Table Cover.*—EDWIN A. JEFFERY, Jersey City, N. J.

The cover has on one side upper and lower hooks. The upper hooks engage with eyes secured to the under side of the table-top. The lower hooks engage with a bail passing through eyes secured to the leg-frame of the table.

Claim.—The cover of a sewing-machine provided with hooks C C', as set forth, adapted to engage with the eyes D D and *f f* on the table, the hooks C' and eyes *f f* having an intermediate brace or bail connection, E, substantially as described, for the purpose specified.

135,122.—*Gathering or Ruffling Attachment for Sewing-Machines.*—ALLAN JOHNSTON, Ottumwa, Iowa.

The gathering-blade is not slotted, as usual, to hold the cloth until the needle enters it, but is moved back a little just as the needle is approaching the cloth by means of a starting-lever operated by the bell-crank lever.

Claim.—1. In a gathering and ruffling attachment for sewing-machines, the combination, with a reciprocating gathering-blade and a vibratory lever for actuating the same, operating together substantially as specified, of the means herein described, or their substantial equivalent, whereby the gathering-blade, when the needle commences to descend, and before it reaches said blade, will be removed from the path of the needle, substantially as and for the purposes herein shown and set forth.

2. In a gathering and ruffling attachment, the combination of a reciprocating gatherer, a vibratory lever for imparting movement to the same from the needle bar or arm, and a starting-lever operated from said main vibratory lever to retract the gatherer out of the path of the needle when the latter commences to descend, and before the said main lever begins to act directly upon the gatherer, as set forth.

3. The combination of an upper stationary holding-blade, an under reciprocating gatherer having an unslotted gathering-edge, a vibratory lever for actuating said gatherer, and the means herein described, or the substantial equivalent of the same, for drawing back said gatherer from the path of the needle immediately upon the descent of the latter, and before the vibratory lever begins to act on the gatherer, substantially as herein shown and set forth.

135,123.—*Gathering or Ruffling Attachment for Sewing-Machines.*—ALLEN JOHNSTON, Ottumwa, Iowa.

When the edge-gage is in the position shown in the drawing, or down, the material will be ruffled at the edge, but when elevated the material passes quite under the ruffler, allowing the knife to engage the material at a distance from its edge.

Claim.—1. In gathering and ruffling attachments for sewing-machines in which the goods to be gathered can pass under the attachment and be drawn back toward the rear of the same so as to be operated on by the gathering knife or blade at a distance from the edge, as specified, I claim an edge-gage hinged to the frame of the attachment in the position substantially as shown and described, and operating as set forth.

2. The combination, with the frame and the foot and holding-blade attached to the same, of the hinged edge-gage and the reciprocating gathering-blade, connected with its supporting-plate by a bowed or bent arm, constructed substantially as described, said parts being arranged for operation as set forth.

135,124.—*Chevron.*—FRANCIS S. JOHNSTON, Philadelphia, Pa., assignor to GEORGE FENCUM JONES, same place.

The different ranks are indicated by lines of stitching made directly upon the material itself.

Claim.—The improved article of manufacture herein described, consisting of a chevron cut from cloth in any desired pattern, with stitched lines, as set forth.

135,125.—*Bobbin for Sewing-Machine Shuttles.*—GEORGE JUENGST, Somers, N. Y.

The spindle may have slight indentations in it before the head is put on, into which the metal of the head is pressed.

Claim.—A bobbin for sewing-machine shuttles with a wire spindle and heads of thin sheet metal, the holes in the latter being spread by a punch to form projections that are afterward pressed down against the spindle to secure the heads, substantially as set forth.

135,126.—*Piano Sounding-Board.*—THOMAS KATER, Hamilton, Canada.

Two sounding-boards of equal size are joined by side and end strips, the sides strengthened by iron plates, and an elastic bridge of the form of the string-bridge connects the upper board to the lower. The whole rests mainly upon its ends.

Claim.—1. The sounding-boards A′ B′, each of a corresponding shape and size, connected together at their edges by the strip C C′ and either or both of the metallic plates D E, as herein set forth.

2. In a double sounding-board for pianos, the sympathetic spring-bridge K, as and for the purpose set forth.

3. The sympathetic spring-bridge K, corresponding in form with the curved bridge L and secured immediately below the same to the sounding-boards, as shown and described.

4. The sounding-boards A′ B′, connected by metallic plates D E and combined with the series of bridges M M attached to the lower board and extending through the upper board, and arranged with respect to the curved bridge L and the strings, as shown and described.

5. A sounding-board for pianos, consisting of the boards A′ B′, metallic plates D E, and connecting-strips C C′, in combination with the series of bridges M, curved bridge L, and sympathetic spring-bridge, substantially as described.

6. The sound-boards supported within the case, as described, and removed from contact with the treble cheek-piece, the iron bar, and iron frame, as and for the purpose set forth.

135,127.—*Packing for Piston-Rods, &c.*—LEOPOLD KATZENSTEIN, New York, N. Y.

Claim.—The packing-rings C D E F having screw-sockets *b* and arranged to form grooves *a*, in combination with rods H and rod B, all constructed as and for the purpose set forth.

135,128.—*Traction or Portable Engine.*—DAN. W. KELLOGG, Battle Creek, Mich.

A novel construction of clutch devices operates the eccentric of the valve. Connects one of the traction-wheels with its driving-shaft by means of a clutch, in order that when the engine is moving around a curve, by detaching one wheel and driving by the other, he avoids the slipping of one wheel. Hangs the intermediate shaft at the forward end of the boiler, to impart the desired tension to the chains of the driving-wheels. Places removable chains on the wheels instead of ribs or corrugations.

Claim.—1. The combination of the crank-shaft C¹, the eccentric *e* mounted loosely on said shaft, and the clutch or shouldered collar *c*¹ secured rigidly to the shaft, these parts being constructed and arranged to operate as set forth.

2. The combination of the crank-shank C¹, loose eccentric *e*, clutch *c*¹, hand-wheel *c*², governor-wheel *c*³, and a connecting-belt, substantially as described.

3. In combination with the shaft E and its hangers, the supporting-rods *g* attached to the front end of the boiler, to relieve the central portion of the boiler from undue strain, substantially as described.

4. The combination of the shaft E, jointed hangers G G′, and adjustable rods *g*, substantially as described, and for the purpose set forth.

5. The combination of engine-shaft C¹, spurred wheel D, second shaft E, spurred wheel D¹ with the traction and supporting wheels D², spurred wheels E³ E⁴ and their connecting-chains, whereby the power of the engine may be applied either to propel the engine or to drive machinery, substantially as described.

6. The combination of the chains *b*³ with the wheels, for the purpose of increasing the traction, substantially as described.

135,129.—*Well-Boring Machine.*—JOHN A. KING, Hamburg, Iowa.

Claim.—1. The arrangement of the frame A, standards B B, cap C, and swival-braces E E, substantially as shown and described.

2. The arms O O, with cylinder P and knives *v v*, constructed and operating substantially as and for the purposes herein set forth.

3. The combination of the grooved screw-shaft D, having the collar *b* and lever G, and passing through the bisected nut *a*, with the cylinder P, arms O O, knives *v v*, and a well auger, all constructed to operate substantially as set forth.

135,130.—*Portfolio for Music.*—JOHN C. KOCH, Brooklyn, N. Y.

The binding-cords are armed with needles passed through retaining eyes, and are connected to elastic tabs. A flap is attached to one cover, to support it in an inclined position as a music-supporter.

Claim.—1. The eyes *n*, loops *o*, and elastic connections *p* to the cover *a*, in combination with the cords *l*, needles *f*, eyes *i*, and elastic connections *d*, as and for the purposes set forth.

2. The flap *m* attached at one edge to the cover *a*, and provided with the tape or ribbon *r* for retaining said flap in place, when employed for supporting the cover *a* at an inclination for use as a music or sheet support, or desk, as set forth.

135,131.—*Machine for Dressing Nuts and Bolts.*—JOSEPH KOHLER, Cincinnati, Ohio.

The nuts to be dressed are on a mandrel between centers, which are on a rest that is fed up to the emery wheel and along its disk or cutting-face by means of two screws at right angles to each other. The nuts are placed and held in position by a graduated wheel attached to the mandrel. A spring or pawl falling into the notches in the wheel holds it in any position desired.

Claim.—1. The combination of the compound rest A with the mandrel *a a*′, centers D D′, and graduated index-plate F for passing the nuts or bolt-heads to be shaped across the flat-side surface or front face of the revolving emery wheel H, substantially as specified.

2. The wheel H, arranged to grind the nuts or bolt-heads by the attrition of its flat-side surface or front face, so as to remain true and flat, in combination with the compound rest A, its attached index F and spring-catch G mandrel *a a*′, and centers D D′, arranged and operating substantially as and for the purposes specified.

135,132.—*Weather-Threshold.*—JOHN W. KRAMER, Bloomsburg, Pa.

The closing of the door presses the spring-lever, and through the rod and pocket raises the metallic threshold-strip into the recess in the bottom of the door.

Claim.—The combination of the spring-lever E and rod *f* with the door-strip D and pocket *g*, substantially as specified.

135,133.—*Lasting Boots and Shoes.*—RICHARD C. LAMBART, Quincy, assignor of one-third his right to NATHAN C. LOMBARD, Boston, Mass.; said LAMBART & LOMBARD assignors to said LOMBARD, trustee of THE LAMBART BOOT AND SHOE MACHINE ASSOCIATION, same place.

Thongs cut from the edge of the upper, but not detached, are forced into slits cut in the inner sole.

Claim.—1. The process of lasting boots or shoes and securing the uppers to the inner soles without the use of nails, pegs, or sewing, by forcing thongs cut from and forming a part of the "upper" into slits cut in the inner soles, substantially as described.

2. The angular arrangement of the slits *a*, *b*, and *d*, as herein set forth and described, for the purpose specified.

135,134.—*Animal-Trap.*—WILLIAM S. LAWRENCE, Winchester, Ky.

A spring and guide-pin, to overcome the inertia of a weight, is so contrived as to transfix the passing animal by pointed rods.

Claim.—The spring *b*, in combination with the "dead fall" B and pin I, substantially as and for the purpose specified.

135,135.—*Water-Heater for Heating Buildings.*—AMBROSE MARRIOTT, St. Louis, Mo.

The concentric water-chambers are arranged above and connecting with the hollow grate-bars, said chambers being cast in semi-annular sections. A removable perforated cap is placed near top of the cylinder P.

Claim.—1. The provisions, in a water-heating apparatus, of the tubular fire-grate C C′, D, pipe H, and annular castings J J′, *j*, K K′, *k*, and M M′, whether made in sections, as described, or otherwise, and tubes L L′, all arranged substantially as set forth.

2. The combination of the annular castings J J′ K K′, and M M′ with tubes L L′, when said castings are made in semi-annular sections, substantially as and for the purposes set forth.

3. The perforated neck *y* and imperforate cylinder *y*, substantially as and for the purpose set forth.

135,136.—*Table-Cutlery.*—CHARLES MCDONALD, Ottawa, Ill.

Two rectangular pieces are slotted and placed over each other at right angles. In the quadrangular space between the ends the tang of the blade is inserted. Molten metal is then poured around, filling the spaces, forming a bolster and securing all the parts firmly.

Claim.—1. The pieces A and B, constructed as described, and provided with slots *a* and *b d*, respectively, to form a handle for table-cutlery, substantially as herein set forth.

2. In combination with the pieces A and B, constructed as described, the bolster *f*, ribs *i i*, and solid piece *h*, all formed in one piece of cast metal, substantially as herein set forth.

135,137.—*Coupling for Steam Heating Apparatus for Railroad Cars.*—WILLIAM N. MCDUFFEE and BENJAMIN F. JAQUES, Petersburg, Va., assignors of one-third their right to D. W. LASSITER, same place.

The latches fasten the two parts, which together form the steam connection between the cars, and the valves—one in each part—when actuated move the latches.

Claim.—1. The pipe-coupling G in two parts, *g g*, held together by latch-levers J J on one and studs *k k* on the other, as described.

2. The combination, with valves H and levers J, of the hand-shafts I having sectional collars L L, as described, so that the valves will be closed whenever the latches are lifted.

135,138.—*Folding Cradle or Crib.*—MICHAEL MCNAMARA, Philadelphia, Pa.

The cradle or crib is constructed with hinged or jointed sides, in four sections, and so arranged with its ends, to which the sides are connected by hinges, as to admit of its being folded with its canvas hammock and hinged bottom into a very small and convenient space for packing or transportation.

Claim.—1. The cradle or crib composed of the end boards A B, posts C, sides E made in sections hinged to each other and to the posts C, and the bottom F, also made in sections, said parts being constructed and arranged in connection with each other, substantially as herein shown and described.

2. The combination of the cloth or netting G and rods H with the frame-work of a cradle or crib, substantially as herein shown and described, to form a hammock or summer bed, as and for the purpose set forth.

135,139.—*Machine for Pitching Barrels, Casks, &c.*—GUSTAVUS MEYER, of Quincy, Ill., assignor of one-half his right to JACOB DICK, same place.

The shaft is provided with a series of eccentric disks operating horizontally for the purpose of giving the keg or barrel a continuous rotary as well as a tilting movement.

Claim.—1. The shaft C provided with disks D E, and operating horizontally for the purpose of giving the keg or barrel a continuous rotary and tilting movement, substantially as shown and described.

2. The combination of the shaft C, provided with the disks D E, in combination with the roller F, substantially as shown and described.

135,140.—*Horseshoe-Nail Machine.*—JAMES MILLS, Keeseville, N. Y.

The nail-rod is presented, through a vertically-oscillating nose-piece, to the alternate action of a pair of striking-hammers, and a revolving roller-hammer, acting on a series of dies situated on an intermittently-revolving anvil. At every complete revolution of the anvil a cutter is raised, the nose-piece depressed, and the pressure of the roller-hammer on the raised cutter, acting against a stationary cutter, severs the finished nail from the rod.

Claim.—The combination, in a horse-shoe nail machine, of a revolving roller-hammer, intermittingly-revolving anvil, and striking-hammers, constructed and arranged to operate substantially as and for the purpose described.

135,141.—*Mustache-Spoon.*—ELLEN B. A. MITCHESON, Philadelphia, Pa.

An ordinary spoon with a plate extending longitudinally from the tip of the bowl to the point where the latter is united to the handle, leaving a portion of the bowl open or exposed. The side of the cover or guard is left open in sufficient space to allow the liquid to pass into the mouth without being brought in contact with the mustache.

Claim.—The combination, substantially as described, of the shield *a* with the bowl of a spoon, for the purpose specified.

135,142.—*Steam Boiling Apparatus.*—ELIE MOREUSE, New York, N. Y.

A steam-dome within and near the bottom of the boiler, connected with steam and waste-water pipe of any convenient steam-generator.

Claim.—The steam-dome *c* and supply-pipe *d* introduced within the vessel *a* and attached at the bottom thereof, substantially as and for the purposes set forth.

135,143.—*Postage-Stamp Affixer.*—EDWIN B. MORGAN, Paterson, N. J.

The paper, damped between a pressing-roll and a wet sponge, is laid over the spring-seated stamp-case, within which the stamps rest upon a fixed block. The plunger slides the case down until the paper is in contact with the stamps, the upper one adhering thereto.

1. A stamp-holding case, C, combined with a post, D, plate E, and a spring, F, substantially as specified.

2. The combination, with the sponge and sponge-holder, of the presser B′, substantially as specified.

135,144.—*Paper-File.*—EMANUEL MOTZ, Woodward, Pa.

The papers are confined to the stock B by winding the string C upon the windlass.

Claim.—The paper-file composed of the bar A, pin B, and string C, substantially as herein shown and described.

135,145.—*Paper-Bag Machine.*—MERRICK MURPHY, Cincinnati, Ohio.

The sheet of paper from a reel has one edge pressed by a roll against a belt running in a paste-vat, and is carried by feed-rollers between the cutters and under a former. The upper cutter is fixed to revolving heads and shears against a stationary blade, severing the blank, which is carried forward by an endless belt until its forward end projects against the drying-cylinder. During this movement its sides have been turned over to form the tube, the front projecting lap of which is struck by the folding-blade, which, in its upward movement, bears against a roll in a paste-vat, which doubles the end between the apron guide-roll and the drying-cylinder, around which it passes until it is ejected at the rear of the machine.

Claim.—1. The arrangement of paste-vat D, belt C and its rollers *c c*′, and guide-roller *b*′, for applying paste to the edge of a continuous sheet of paper, substantially as specified.

2. In combination with the former-plate I, the hook *i* and grooved or recessed feed-roller *h*, as and for the purpose set forth.

3. The combination of the former-plate I, endless carrying-belt G and its guide-roll *h*‴, drying-cylinder M, arranged outside of the said belt, and a folding-blade, the whole operating substantially as specified.

4. The combination of the folding and pasting blade K, drying-cylinder M, belt G, and its guide-roller *h*‴, for forming the bottom seam of the bag, substantially as specified.

5. In combination with the elements of the fourth claim, the paste-vat L and paste-roller *m*, the whole arranged and operating substantially in the manner and for the purpose specified.

135,146.—*Double-Acting Pump.*—KAYRAN NOLAN, Galesburg, Ill., assignor of one-half his right to BARNARD RYAN, same place.

Five valves are so arranged that the pump will be double-acting in this manner: Upon the up-stroke of the piston, both valves in the center pipe, which contains the piston, are opened, together with the upper exit-valve. Upon the down-stroke, the lower valve in the center pipe, the valve in that perpendicular side pipe which is furthest from the exit and the lower exit-valve are opened.

Claim.—In combination with the cylinders A C C′ and connecting-tubes D *e*, the five valves J K L M N, arranged for operation with relation to the piston B, in manner substantially as and for the purpose specified.

135,147.—*Knob-Latch.*—EMERY PARKES, New Britain, Conn., assignor to THE RUSSELL AND ERWIN MANUFACTURING COMPANY, same place.

The hub or "follower" is provided with a collar which projects beyond the outer face of the lock-case sufficiently far to receive and support the knob-shank, whereby the case may be dressed off by planing, grinding, or other means, with a comparatively small expense to that which would be necessary if the supporting-collar formed a part of the case itself.

Claim.—That improvement in "rim-locks" which consists in constructing the hub or follower B with a shank-support, D, for the knob and combining the same with the lock-case A, substantially as described, for the purposes specified.

135,148.—*Cultivator.*—JAMES H. PATTEE, Monmouth, Ill., assignor to himself, HENRY H. PATTEE, and ITHAMER P. PILLSBURY, same place.

The braces between the standards and beams are rendered adjustable by means of corrugated plates. A bolt in a segmental recess in the beam-plate limits the vertical movement of the plow-beam.

Claim.—1. The braces K, adjustably attached between the beams G G and standards H H by ratchet-plates I′ and M′, substantially as described, and for the purpose set forth.

2. The beam-plate N having a segmental recess in the outer end, in combination with the journal-plate P, bolts *n* and R, and spindle B, substantially as described, and for the purpose specified.

135,149.—*Screw-Propeller.*—NEWTON A. PATTERSON, Athens, assignor to himself, MCKENDRIE F. MILLER, and LANDON N. MILLER, Rheatown, Tenn.

Peculiar construction claimed whereby centrifugal action is obviated and an increasing pitch of screw is made.

Claim.—The blade A, made concavo convex and provided with pointed extensions C, as described.

135,150.—*Machine for Bending Sheet Metal.*—JOHN PEARCE, Brooklyn, N. Y., assignor to MELVIN STEPHENS, same place.

A convex and a concave roller and a shoe, so arranged as to bend longitudinally and transversely at the same time. The diameter of the longitudinal bend may be raised by adjusting the shoe.

Claim.—The combination of a shoe with the convex roller *a* and the concave roller *c*, in substantially the manner set forth, for bending a sheet-metal ring, substantially as set forth.

135,151.—*Band-Pulley.*—CHARLES HENRY PERKINS, Providence, R. I.

Claim.—1. In the band-wheel or pulley, the combination of the flanged rim A and the joint lap or laps *i* with the chambered hub C and the spokes B formed and applied to the hub and the rim, as set forth, all being combined and arranged substantially as specified.

2. In a wrought-iron band-wheel or pulley, a flanged rim made in one piece, or more, with a lap-piece arranged at and secured to the rim at each joint, as set forth, and with the spokes bolted or fastened to the flange or flanges of the rim, all being essentially as specified.

135,152.—*Fire-Proof Compound for Coating Roofs, &c.*—RICHARD U. PIPER, Girard, Michigan, assignor of one-half his right to MONROE HEATH, Chicago, Ill.

Alum, China clay, Glauber salts, and wood or coal ashes, in equal parts, made into a paste by mixing with flour and water.

Claim.—The within-described compound for fire-proofing the surfaces of roofs, walls, &c., or any substance to which the same may be applied, substantially as set forth.

135,153.—*Fire-Proof Paper for Roofs, &c.*—RICHARD U. PIPER, Girard, Mich., assignor of one-half his right to MONROE HEATH, Chicago, Ill.

Prepares the paper by drawing it through a bath composed of liquid silica and paint or coloring matter, and then passing it between calender-rolls.

Claim.—Submitting paper to a mixture of either hot or cold liquid silica or quartz and paint or suitable coloring matter, and then calendering the surface of the paper or otherwise suitably finishing off the surface of the same, as and for the purpose set forth.

135,154.—*School-Desk.*—CHARLES H. PRESBREY, Sterling, Ill., assignor to NOVELTY IRON WORKS MANUFACTURING COMPANY, same place.

The arm that projects upward from the desk-frame has on its outside a circular recessed projection, and on its inside a conical trunnion, with a seat-arm on said trunnion; and the slotted washer is fitted on the trunnion outside of the seat-arm. The slot in the lower end of said washer engages with the lug that projects from the desk-arm just below the conical trunnion. The desk-arm, seat-arm, and washer are secured together by a bolt and nut.

Claim.—The combination of the frame A with lug *f*, the circular recessed projection H with conical trunnion *e*, the arm G placed on said trunnion, the slotted washer I placed over the lug

f, and fitting on the end of the trunnion *a*, and the bolt and nut *d e* for confining the whole together, all substantially as and for the purposes herein set forth.

135,155.—*Coffin-Plate.*—GEORGE B. RANSOM, Chester, Conn., assignor to himself and JAMES B. CLARK, same place.

The inscription-plate is protected by a hinged cover and an interposed packing of tin-foil.

Claim.—The combination of the inscription-plate A and covering-plate C, substantially as and for the purpose specified, and with or without the packing between the two.

135,156.—*Butter-Knife Rest.*—BENJAMIN D. REED, Westfield, Mass.

Three or more spring-wires having at the lower end of each a bend to encircle the edge of the dish, and a short distance above, on each wire, a hook to serve as a rest for the knife. The wires are united at their upper ends in a head or any other ornament to form a suitable handle.

Claim.—Three or more spring-wires, A A, meeting at the top, and having handle B, each wire formed with the bend *a* and hook *b*, substantially as and for the purpose set forth.

135,157.—*Truck-Barrow.*—JAMES J. RICHARDSON, Marion, S. C.

Claim.—The cross-bar I arranged to both connect the side portions of the barrow and scrape the wheels D, as specified.

135,158.—*Slate.*—E. WALTER ROBERTS, Troy, N. Y., assignor of one-third his right to T. S. WOTKYNS, same place.

Two slates are hinged in such a manner as to open or lie flat on each other to expose either side, as desired.

Claim.—A pair of slates connected together at their edges by means of the pivoted metal bars C or their equivalent, so as to be capable of folding together in either direction, substantially as and for the purpose specified.

135,159.—*Refrigerator for Preserving Butter, &c.*—GEORGE B. ROHRER, Oxford, Ohio.

A refrigerator with three compartments, the middle one to contain the ice, the others being wider with doors opening into one end from the top to the bottom, and containing galvanized iron, tin, or zinc pans, one upon another, with spaces between; also, spaces between the said pans and the side walls for the circulation of air.

Claim.—1. The uncovered butter-chambers D D having perforations R, combined with an intermediate ice-chamber, E, having perforations K L, as described, for the purpose of producing a circulation of air.

2. The butter-pans H having the ribs P Q to cause a space between the pans and partitions, and to prevent any mobility thereof, as set forth.

135,160.—*Tube-Welding Machine.*—JAMES SADLER, New York, N. Y.

A bulb upon a mandrel is situated between an upper and lower die and inside of the tube which is repaired. The part is heated in the furnace and pushed forward between the dies, when the tube is rotated by one hand and repeated light blows are struck by a hammer in the other hand upon the upper die. The parts are interchangeable to adapt the machine to tubes of varying sizes.

Claim.—1. The tube-welding machine A, constructed substantially as shown and described.

2. The combination of the machine A with a forge, B, substantially as described, for the purposes set forth.

3. The adjustable supporting-arch N and springs Q Q, in combination with the die E, as and for the purposes described.

4. The adjustable gage H, in combination with the mandrel of a tube-welding machine, as and for the purposes described.

135,161.—*Car-Brake.*—WILLIAM H. M. SANGER, Bay Side, N. Y., assignor to KATIE SANGER, same place.

A brake-bar hinged upon the cow-catcher and operated by an upright and a horizontal lever.

Claim.—The brake-bar *f* hinged upon the cow-catcher, and provided with the shoes *r r*, in combination with the levers *g* and *h*, and rope or chain *i*, as and for the purposes set forth.

135,162.—*Excavator.*—F. WILLIAM SCHULTZ, Mount Pleasant, Iowa, assignor of one-half his right to WILLIAM E. BEATTY, same place.

The machine is carried upon three wheels, the forward of which, or steering-wheel, is arranged to turn freely in all directions to allow of turning in a small space. The earth is excavated by a plow hinged to the fore end of the elevator-trough, and is adjustable vertically by the means specified. The excavated earth is carried up through the trough by an endless chain-band and buckets or scrapers operated from the main wheels, and is deposited in the earth-box between the said wheels. The dumping is effected by a lever beside the driver's seat, which, through connecting-rods, operates the hinged gates composing the bottom of the box. Said connecting-rods are severally supported at their ends in pivoted bearings in the lever to provide for its varying angle of inclination.

Claim.—1. The arrangement of the box C with the metal bars D D, binding its side edges and extending forward to form the frame of my machine, substantially as herein set forth.

2. The combination of the stationary ring E grooved on its under side, the rotating ring G, rigid axle *b*, wheel H, metal straps *d d*, and tongue I, all constructed and arranged substantially as and for the purposes herein set forth.

3. The arrangement of the drive-wheels A with cog-wheels J, endless chains *e*, and pinions *f* with clutches for operating the shaft A, substantially as herein set forth.

4. The arrangement of the crank-shaft *n* with lever K, links *m m*, jointed bars *i i*, and springs *k k* for throwing the pinions *f f* in and out of gear, substantially as herein set forth.

5. The combination of the hoes *s s* on the endless chain *p*, the trough M, and the plow N, hinged to the lower end of said trough, substantially as and for the purposes herein set forth.

6. The arrangement, with the plow, conductor, and hoes, of the curved arms *s*, hinged frame O with lever P and spring-pawl *b'*, rack R, and connecting-arms *a'*, all substantially as and for the purposes herein set forth.

7. The oscillating bearings *m'* arranged in or upon the lever T, and each having a rod, *h'*, passing through it, in combination with the cranks *t'* and the gates S, all substantially as and for the purposes herein set forth.

135,163.—*Muff.*—RAPHAEL M. SELDIS, New York, N. Y.

Two pieces, one of fur, the other of leather, and each equal in size to one side of the muff, have a dovetail-shaped piece cut from their centers. These pieces are transposed and sewed into place, and the leather piece forms the back and the fur piece the front of the muff.

Claim.—As a new article of manufacture, a muff the front of which is formed of a piece, *a*, of leather and a piece, *d*, of fur, while its back is formed of a piece, *c*, of fur and a piece, *b*, of leather, substantially as shown and described.

135,164.—*Band-Saw Gang.*—HENRY SILLMAN, Brooklyn, N. Y.

The pulleys which carry the saws are placed in echelon and one saw in advance of the others.

Claim.—1. The double-boxes R S, adjusting-screws K L, gear-wheels P P, and vertical shaft and gears O, by means of which the saws are strained and one of them adjusted laterally, substantially as shown and described, for the purposes set forth.

2. The pulleys D D and E E, arranged as shown and described, to adapt them for operating saws C C of equal length.

135,165.—*Cultivator.*—ZACHARIAH B. SIMS, Bonham, Tex.

A cultivator constructed with a perforated head, which admits of the shovels being laterally adjustable. It is further provided with angular-shaped braces, which are fastened to the tongue and the perforated cross-head.

Claim.—The combination of the angular-shaped iron braces C provided with the perforations *c*, the perforated beam A, the perforated cross-head B, and reversible shovel F, substantially as and for the purpose specified.

135,166.—*Blind-Slat Adjuster.*—WILLIAM B. SLOAN, Hamburg, Iowa.

A disk of rubber is secured to the flat surface of one of the blind-slats near its end, and bears against the frame so as to retain the slats in any desired position.

Claim.—1. A rubber block, attached to one of the slats at its end, as shown at *d*, and having a frictional bearing against the blind-frame, substantially as described.

2. The blind-frame *a*, having the beveled edges *b* and plane surface *m*, in combination with the rubber block *d* attached to one of the slats, as and for the purpose described.

135,167.—*Oyster-Tongs.*—ISAAC SMITH, Bruceport, Washington Territory.

The strengthening stays run through projections upon the shank, to be more readily renewed if broken.

Claim.—The head A, having shank B with transversely-perforated ribs D thereon, combined with stale and bars E, as and for the purpose described.

135,168.—*Binder's Table for Harvesters.*—JAMES H. SMITH, Orford, Iowa.

A binding and dumping table is pivoted to either side of the machine. These tables are provided with pins to retain the bundles, and are connected together by levers so that they are both dumped by one operation of the driver.

Claim.—1. The hinged binding-tables D, rods G, and levers F F, connected by slot and pin, arranged on the frame A, with reference to the trough B and platform C, as shown and described, to adapt them to operate in the manner set forth.

2. The dumping-tables provided with stud-pins to hold the bundles, so that they will not be shaken off while being carried, substantially as specified.

135,169.—*Milk-Cooler.*—SMITH SPENCER, Kiantone, N. Y.

The flanges of the milk-vessel rest upon suitable packings upon the inner edge of the ring, which also rests upon packing upon the edge of the ice-vessel, so that an air-tight space is left for the reception of ice. The frame E supports the strainer E' and steadies the cooling apparatus. The funnel is provided with legs, which rest upon the ring.

Claim.—1. The combination of the bucket A, flanged ring B, can C, and packings *a c'*, all arranged as described.

2. The combination of the bucket A, flanged ring B, can C, and packings *a c'* with the tunnel D having legs *d*, all arranged as specified.

3. The combination of the bucket A, flanged ring B, can C, packings *a c'*, and tunnel D with the frame E and strainer-pail E', all arranged as set forth.

135,170.—*Stove-Pipe.*—WILLIAM H. STEPHENSON, Bluffton, Ind.

The pipe may be made larger or smaller to adapt it to any-sized flue or stove-collar.

Claim.—The overlapping and slotted stove-pipe, in combination with the internal plate B and its bolts, for the purpose of securing the pipe in position after adjustment and covering the slots in the pipe, as is herein set forth.

135,171.—*Starching-Machine.*—LEOPOLD STERNBERGER, Philadelphia, Pa.

A table with movable center having on its face an elliptical depression, over which is suspended, by a pivot, an arm with its bottom enlarged and formed to fit the depression. From this arm is attached a pitman connecting it to the shaft of the machine, and motion given it by an ordinary crank. To the under side of the table is connected an upright shaft with a treadle worked by the foot, by which tension or pressure is given to the parts in contact by the aid of a bell-lever. The foot of the arm is constructed with a shoulder in the enlargement, to which is connected, by spiral spring, a device which passes over the buttons on garments in the process of starching.

Claim.—1. In a starching-machine, the combination, substantially as described, of an oscillating rubber, A, with a rubbing-bed, D, rendered adjustable toward and from the said rubber.

2. The oscillating rubber A, with its rounded face *m* and recess *p*, in combination with the concavity *b* of the rubbing-bed.

3. The combination, substantially as described, of the yielding stud *s* with the recessed rubber A and rubbing-bed.

4. In a starching-machine, the combination, substantially as described, of the operating-treadle E and connecting-rod *a* of the rubbing-bed with the rod *f*, bell-crank lever *i*, slotted arm *h*, and belt-shifter *b*, or any equivalent devices, whereby the oscillating rubber may be set in motion simultaneously with the raising of the bed by the treadle, and stopped simultaneously with the lowering of the said bed.

135,172.—*Gasometer or Gas-Holder.*—JOSEPH C. TIFFANY, Portsmouth, N. H.

A dry gas-holder composed of flexible sides united to a rigid top and bottom, the sides having rings which move over upright rods so as to prevent the sides from falling inward or outward when the holder is collapsed.

Claim.—1. The stationary bottom D and movable crown or head L of a gasometer, connected together by a flexible curtain or body, K, said curtain being guided in its vertical movement by loops or eyes Q, traveling on guide-stems P, substantially as and for the purpose set forth.

2. The flexible body K of the gasometer, secured to the bottom D and movable head L by clamping bands or rings M, substantially as shown and described.

3. The bottom D of a gasometer made concave or corrugated for the reception of condensed material or substance, as described.

4. A screen or false bottom, arranged and supported at or near the bottom of a gasometer, substantially as described.

5. The combination, with a concave or corrugated bottom, D, of the diaphragm or false bottom R, substantially as and for the purpose specified.

6. One or more siphon or discharge tubes, S, combined with the bottom D of a gasometer, for the purpose specified.

7. The movable crown or top L of the gasometer, consisting of a skeleton metallic head and a flexible covering attached to the same, substantially as and for the purpose described.

8. One or more hoops or bands connected with the flexible curtain of a gasometer, for the purpose specified.

135,173.—*Plant-Protector.*—THEODORE R. TIMBY, Tarrytown, N. Y.

The joint between the funnel and the bell is made sufficiently open to allow the passage of rain when both are used together; or apertures may be formed in either at their juncture for the same purpose.

Claim.—1. The bell or cover A, constructed with a funnel-shaped top conducting to a central opening of any desired size, and adapted for use as herein described, and for the purposes set forth.

2. The combination of the bells A and D, adapted for combined use as herein described.

135,174.—*Sugar-Cane Cultivator.*—ALCIDE TROUARD, New Orleans, La.

A furrow is plowed upon each side of the row of cane stubble, called "barring." The cultivator has a cylinder armed with radiating teeth, which is adjustably mounted on runners. The teeth are forced in among the cane stubble as the machine is drawn over the ground, and thus loosening the soil around the canes.

Claim.—The improved machine for grubbing sugar-cane stubble, the same consisting of frame G G', runners I I, and the cylinder A provided with the teeth B, having points constructed as described, said cylinder being mounted on the axle-shaft C journaled in the pivoted levers D, which are adjusted at their free ends by the standards E and pins *d*, all as shown and described.

135,175.—*Sheep-Holder.*—SAMUEL TUCKER, Wabash City, Ind.

The holder is applied to a table by ordinary pins, and has clamps at each end for holding the feet in gains. The clamps are held up when out of use by springs.

Claim.—1. An apparatus for holding sheep when being sheared, consisting of the bed-bar B, head-pieces C C, uprights E E, clamps F F, and recesses or gains H H, substantially as set forth.

2. The springs G G, fastening-wires I I, and pins J J, in combination with the bed-bar B and clamps F F, as and for the purposes described.

135,176.—*Dish-Washing Machine.*—JOSEPH USHER, West Albany, N. Y.

A lower ventilated chest having a drawer in which the frame with dishes is placed to dry. Above this chest is an upper water-tight box having a hinged cover. Inside of this box is placed a revolving water-tight box. In the inner box is placed a frame for holding the dishes; said frame is divided into one or more compartments, and is provided with movable grates, hook-bars, and springs, so as to properly secure the dishes in place.

Claim.—1. The portable frame I divided into one or more compartments, lower movable pivoted grates J, springs K, upper movable pivoted grates L, pivoted hook-bars M for hooking on the upper grates L for the purpose of securing and holding the dishes, substantially as herein shown and described.

2. The combination of the revolving water-tight case F G and its attachments and frame I with its internal arrangements, with outer chest A, ventilated box D, and ventilated drawer E, substantially as herein shown and described, and for the purposes set forth.

135,177.—*Apparatus for Detaching Horses from Vehicles.*—THOMAS Y. VANCLEAVE, Cornersville, Tenn.

A device attaching and detaching the shafts, and an apron-roller and cover attached to the dash.

Claim.—The combination, with the axle A, of the angular lever C, arms *a a*, rods D D and G G, loops *b b*, ears *d d*, shaft-clips *e e*, and the hubs H H with stops *i i*, all constructed and operating substantially as set forth.

135,178.—*Corn-Planter.*—SOLOMON VANNUYS and HEZEKIAH VANNUYS, Bethel, Ind.

To prevent crushing and bruising of the seed, two flat springs, one above, the other below a reciprocating slide covering its seed-cup, permit the entrance, and retention therein, of the seed during its passage to the outlet.

Claim.—In combination with the feed-slide of a corn-planter or seeder, the spring-plates C and D, when arranged substantially as shown, and for the purpose set forth.

135,179.—*Machine for Cutting Files.*—CHARLES VOGT, New York, N. Y.

The file-bed carriage rests wholly on the feed-screw, and a toggled frame serves to raise it off the screw at the end of its journey. The blank is held by spring-clamps in contact with its edges. The cutter is connected to the end of a rod projecting downward from a piston that works in an air-chamber, which rod and piston are elevated by a cam. A valve opening outward from the chamber and controllable by the workman is regulated to allow more or less air to escape, and thus proportion the force of the blow to the varying width of the blank. The feed-pawl, operating by friction upon the periphery of a disk on the feed-screw, is made elastic, so that the deflection of it, caused by resistance of the disk, will, in its relaxation, occupy the time required for the crank to pass its center.

Claim.—1. The bed *a* resting upon and supported by the screw *b*, in combination with file-cutting mechanism, said screw *b* being of sufficient strength to support the bed while the file is being cut, substantially as set forth.

2. The frame composed of the bars A and parallel-motion links, in combination with the saddle-shaped bed *a* and screw *b*, for the purposes set forth.

3. The gage *n* and its arm *o*, in combination with the cutter *i*, air-cylinder *w*, and beds *l* and *a* for maintaining the surface of the file-blank parallel with the edge of the cutter, substantially as set forth.

4. The clamping-jaws *p s* and spring *t*, constructed substantially as specified, and employed for holding the file-blank, as and for the purposes set forth.

5. The slides *v* adjusted by the screws 11 12, in combination with the stock *n* of the cutter *i*, and the air-piston *w'*, substantially as set forth.

6. The valve 20 opening outwardly from the cylinder *w*, and allowing the air to pass freely, in combination with the rock-shaft and toe, or their equivalents, to regulate the point to which the valve shall close each movement of the piston and determine the force of the blow, as set forth.

7. The feeding-clamp *g* acting upon the cylindrical flange of the screw *b*, and provided with a flexible or yielding arm, *c'*, and connection to the adjustable crank-pin 2, substantially as and for the purposes set forth.

135,180.—*Condenser for Steam-Engines.*—GEORGE WALES, Brooklyn, N. Y.

Two cast metallic sections, convexo-concave in form, are bolted together, with a division-plate in the center, having two series of tubes set in perforated heads, placed a sufficient distance apart to form a chamber, in which there are two division-plates cast; also induction and eduction nozzles for steam and water, the same passing in opposite directions, one passing through the tube, while the other passes around and through them a second time after induction.

Claim.—1. A condenser consisting of a series of circular tubes arranged within a casing and supported therein by the tube-heads, substantially as described, for the purpose specified.

2. The division-plate C combined with the tube-heads C^1 C^2, in the manner described, and so arranged in respect to the circular pipes as to form two compartments, substantially as described.

3. The combination of a series of circular pipes with the division-plate C, tube-heads C^1 C^2, divided casing A B, and induction and eduction nozzles, substantially as described, for the purpose specified.

135,181.—*Feed-Water Heater.*—GEORGE WALES, Brooklyn, N. Y.

Claim.—The feed-water heater, consisting of the U-shaped cases D^1 D^2 bolted together and to the steam induction and eduction chambers A B, as described, in combination with the series of U-shaped tubes F F, tube-sheets E E', drip-pipes H H, and valve I, substantially as described.

135,182.—*Cutter-Holder for Planing-Machines.*—WILLIAM WALKINGTON, Leeds, England.

The two cutters are arranged in a box in such a manner as to cut in opposite directions as the table reciprocates. Both of these cutters are hinged in the box for facilitating their adjustment. The parts are all held together firmly when the cutters are operating by a hook. The cutters are adjusted by eccentrics.

Claim.—The box A provided with the rigid portion *a* and swinging portion *a'* and clamps for holding the adjustable tools *c d*, in combination with the slide *i*, eccentric *j* or its equivalent, hook *f*, and stud *g*, all constructed and arranged substantially as herein shown and specified.

135,183.—*Potato-Digger.*—WILLIAM H. WALL, Elbridge, N. Y., assignor of one-half his right to HARRISON W. GARRISON, same place.

The end of the plow-beam has grooves that receive the shares.

Claim.—1. The combined beam and standard, rounded up, as shown at *i i i*, and adapted, by the construction of its lower end, for attachment either to the digger D or plow P, substantially as and for the purposes specified.

2. The potato-digger attachment D, consisting of the wings *d d*, the point *d'*, the two sets of prongs *e e'*, arranged as described, and the arms *d² n* for securing it to the part A C, substantially as and for the purposes set forth.

135,184.—*Sash-Holder.*—JOHN R. WATSON, Allegheny City, Pa.

A rubber roller is pivoted in an adjustable bearing, which is formed with a beveled back fitting into a beveled recess at the corner of the sash. This bearing is provided with a lug, through which a set-screw passes, serving to move the whole device downward and outward in its beveled recess, thus adjusting the roller to bear upon the window-frame with the exact degree of pressure requisite to hold the sash in desired position.

Claim.—The adjustable bearing A', provided with a beveled back, lug *f*, and set-screw *e*, and placed in a recess in the sash B, the back of the said recess being beveled to correspond to the back of the bearing, as hereinbefore described, and for the purpose set forth.

135,185.—*Measuring-Wheel.*—THOMAS R. WAY, Springfield, Ohio.

The loose index on the graduated traveling-wheel, for measuring wagon-tires, &c., is set to the desired point by a nut, and carries upon it a second adjustable index also set thereto by a screw or nut, for marking off any required allowance for expansion.

Claim.—In combination with the measuring-wheel, provided with the adjustable pointer D, the pointer F, when arranged as and for the purpose set forth.

135,186.—*Grain-Drill Tooth.*—JAMES D. WELSH, Farmland, Ind.

For the reception of the arm, to which it is attached, it has two projecting flanges in front at its top. This chamber is one with the interior of the tooth, all being open at the top. The arm is pivoted at its bottom, and has a wooden pin above, which breaks when the tooth meets an unyielding obstruction. There is a slot in front of this pin to facilitate the removal of the broken pin.

Claim.—The drill-tooth, constructed as described, having the slot E in the rectangular socket B, and adapted for connection with the shank C, substantially as and for the purpose specified.

135,187.—*Car-Starter.*—JAMES J. WHEELER, Grinnell, Iowa.

To a frame provided with a drum and crank, two clamping devices are attached, one which will grasp the rail more firmly as the frame is raised from the track, while the other operates to tighten as the frame is depressed.

Claim.—1. The combination, with the slotted shanks of clamp-jaws, of a wedge attached to a leg of frame A B C and pivoted to a sliding bolt, I, as and for the purpose described.

2. The frame A B C, the drum D with crank E, and the chain F, combined with the clamp to form a car-mover, as described.

135,188.—*Iron Fence.*—JOHN B. WICKERSHAM, Philadelphia, Pa.

The end of the perpendicular rod forms the top of the ornament, the enlarged portion being formed around it. The horizontal bars are secured to the perpendiculars by wedges or keys within metallic connecting-blocks.

Claim.—1. The metal connecting-blocks D, made with seats for the wedges or keys, and binding the bars of the fence, in the manner set forth.

2. The ends to the pickets, formed of the upright bar and of the collar thereon, as set forth.

3. An iron fence made with the pickets *a*, connecting-blocks D, rail *i* placed flatwise, and rail *m* placed edgewise, as and for the purposes set forth.

135,189.—*Spindle-Step for Spinning-Machines.*—CHARLES F. WILSON, Northbridge, Mass., assignor to himself and JESSE E. FOLK, Brooklyn, N. Y.

The spout of the oil-can is prevented from touching the spindle, and the whole device forms a cheap and efficient lubricating step and cover.

Claim.—1. In a spindle-lubricating device, a sheet-metal case or cover, A, having its oil-hole formed by punching back a portion of the case, substantially as and for the purpose specified.

2. A spindle-lubricating device formed of the sheet-metal case or shell A, bent inward at the top, and inclosing the step-block B, provided with holes G, H, and F, for passage of the oil, all constructed and arranged as shown and described, for the purpose specified.

135,190.—*Spindle-Bolster for Spinning-Machines.*—CHARLES F. WILSON, Northbridge, Mass., assignor to himself and JESSE E. FOLK, Brooklyn, N. Y.

Oil poured into the reservoir flows down between the spindle and the shell into the cup, and is, by the rotation of the latter, elevated and passed in again to the spindle by means of the lips and apertures.

Claim.—1. A spindle-bearing consisting of the shell C, box D, and cup E, constructed and arranged substantially as described.

2. In combination with the spindle B, the cup E and the sheet-metal bearing-sleeve or box D having an oil-reservoir formed on its upper end, and provided with apertures J and ears or lips K projecting outward and over the same, all as shown and described, whereby the oil supplied to the reservoir of said sleeve will be fed gradually through it and returned through its central apertures, a circulation of the lubricant being thus maintained in contact with the spindle, as specified.

135,191.—*Land-Roller.*—JOHN WOOLRIDGE, Dean's Corner's, Ill.

Land-rollers constructed in sections, each section being pivoted or attached to hangers, which are secured to a cross-bar, constructed in two parts and attached to the tongue at an oblique angle. One roller remains stationary while the other moves on the arc of a circle in turning around, and is, when the roller moves forward, brought into proper position and locked by the forward movement of the same.

Claim.—1. Two rolls, J J, connected by a two-part bar, B, that is attached to tongue at an oblique angle, and of which the lower section is pivoted, in the manner and for the purpose described.

2. The means described for holding the rolls to each end of the bar B so that they may turn laterally in passing over obstructions, consisting of the frames H and blocks G, constructed and pivoted together, substantially as set forth.

3. The means described for allowing the pivoted section of bar B to stand still while the roller is being turned at the end of a "land," and yet to be automatically locked by the moving forward of the team, consisting of the obliqued groove and overhanging lip at the outer end of each section of bar B, constructed substantially as specified.

135,192.—*Spring for Doors, Gates, &c.*—ROBERT ESPEY, St. Louis, Mo.

A coil-spring is given the proper amount of torsion by a key fitting in a seat in a bracket screwed to the post. Semicircular grooves are made upon the periphery of the key, and also of the seat, and a pin inserted in these holds the key firmly and prevents rotation.

Claim.—The pin A and socket-bracket E F, each constructed with longitudinal grooves relatively spaced, to operate as described, in combination with the key G, adapted to occupy the key-seats successively formed by the rotation of the pin, to adjust the spring, substantially as herein set forth, for the purpose specified.

REISSUE PATENTS.

5,239.—*Stove-Pipe Damper.*—R. MOSS BRECKENRIDGE, West Meriden, Conn.—Patent No. 56,891, dated August 7, 1866.

The rod is bent to fit into a groove of corresponding form in the damper-plate. The handle-end of the rod is bent, forming a spring to hold the damper in position.

Claim.—1. The rod A combined and arranged with the damper-plate C, substantially as and for the purpose herein set forth.

2. The rod or handle of the damper-plate, constructed or provided with a spring arranged to enter and bear against the edges of the aperture in the pipe through which said rod passes, essentially as specified.

5,240.—*Broiler.*—WILLIAM T. HOWARD, Baltimore, Md., assignor to HENRY G. LEISENRING.—Patent No. 113,886, dated April 18, 1871.

Claim.—In a broiler, the broad knife-edged bars *g g*, inclined and arranged with relation to the parallel-grooved bars *d d*, as herein shown and described, whereby the heat and flame are allowed free access to the entire surface of the meat, and the juices thereof conducted into the trough *e*, the whole constructed and combined so as to operate in the manner set forth.

5,241.—*Billiard-Table Cushion.*—HUGH W. COLLENDER, New York, N. Y.—Patent No. 114,410, dated May 2, 1871.

Claim.—A billiard-cushion constructed to operate upon the principle and in substantially the manner described, for the purposes set forth.

5,242.—*Horse Hay-Rake.*—CALISTA E. COX, West Somerset, N. Y., executrix of HARVEY W. SABIN, deceased.—Patent No. 7,813, dated December 3, 1850; extended fourteen years.—Division A.

A clutch between the rotating axle and the bar which lifts the teeth is thrown into action by a hand-lever, and automatically disconnected by a tripping-plate on the machine.

Claim.—1. An oscillating horse hay-rake which discharges its gathered load at the will of the operator by the draft or power of the team, substantially as described.

2. A wheeled horse hay-rake, both capable of discharging its gathered load upon the ground by the draft of the team and automatically resetting itself to gather a fresh load, substantially as described.

3. An oscillating horse-rake, the teeth of which do not rotate with their shaft, so constructed that its teeth may either be elevated by the draft of the team or by the attendant, substantially as described.

5,243.—*Horse Hay-Rake.*—CALISTA E. COX, West Somerset, N. Y., executrix of HARVEY W. SABIN, deceased.—Patent No. 7,813, dated December 3, 1850; extended fourteen years.—Division B.

The gathered hay upon the teeth of the rake may be discharged at the will of the operator or automatically.

Claim.—1. Rake-teeth arranged directly on the axle of the carriage-wheels, and so that they can articulate upon said axle, for the purpose set forth.

2. An oscillating bar for raising rake-teeth arranged directly on the axle of the carriage-wheels, and so that it can articulate on said axle, for the purpose set forth.

3. An oscillating bar for exerting pressure upon rake-teeth arranged upon the axle of the carriage-wheels, and so that it can articulate on said axle as its center of motion, for the purpose set forth.

4. An oscillating pressure-lever or a coupling-lever arranged on the axle of the carriage-wheels, and so that either or both can articulate on said axle, for the purpose set forth.

5. A clearer to rake-teeth arranged upon an extension of the thills in rear of the axle of the carriage-wheels, said axle extending entirely across the carriage-frame, and so that, with the thills, it can articulate or oscillate on the axle, for the purposes set forth.

5,244.—*Horse Hay-Rake.*—CALISTA E. COX, West Somerset, N. Y., executrix of HARVEY W. SABIN, deceased.—Patent No. 7,813, dated December 3, 1850; extended fourteen years.—Division C.

Claim.—1. The application of pressure, at the will of the operator, to metallic spring rake-teeth, which are so constructed as to have a spring action within themselves from their gathering ends to the point (or forward thereof) where the pressure is applied, to hold them down to their work, by means substantially as herein described.

2. The combination of independently-articulating rake-teeth which are springs within themselves and a pressure contrivance which is under the control of the operator, substantially as and for the purposes herein described.

5,245.—*Horse Hay-Rake.*—CALISTA E. COX, West Somerset, N. Y., executrix of HARVEY W. SABIN, deceased.—Patent No. 7,813, dated December 3, 1850; extended fourteen years.—Division D.

When it is desired to have the teeth placed a greater distance apart than the length of the eye-bearings will permit, rings may be introduced between the abutting ends of the bearings.

Claim.—Rake-teeth arranged on articulating tubular laterally-bracing and vertically-supporting eye-bearings, so that the attaching end of each tooth shall cross or intersect a vertical plane passing longitudinally through the axis of the bearings, substantially as described.

5,246.—*Culinary Pot.*—JOHN S. KIDD and MARY L. MELVILLE, Brooklyn, N. Y.—Patent No. 129,034, dated July 16, 1872.

Two or more independent pots, adapted for use singly or together in one pot-hole or in a cluster of separate holes in the stove-plate.

Claim.—1. Two or more pots nested or concentrated in a cluster in the manner described, and adapted for use in a single hole of a stove or in a cluster of special holes, substantially as specified.

2. The combination, with the said cluster of pots, of a cover, F, for ordinary pot-holes, or a stove-plate having a cluster of holes, E, corresponding to the cluster of pots, substantially as specified.

5,247.—*Carbureter.*—HIRAM S. MAXIM, New York, N. Y., assignor, by mesne assignments, to MAXIM GAS-MACHINE COMPANY.—Patent No. 81,923, dated September 8, 1868.

The generating-chamber is connected above and below by pipes with a supplemental chamber, in which is a cylindrical float. The supplemental chamber connects by a pipe, in which is a valve, with a heating-chamber below the main generating-chamber. Above the generator is a gas-holder with weighted diaphragm, and a series of levers and valves, so connected as to regulate the flow of gas from the generator to the gas-holder.

Claim.—1. A gas-holder, a tube supplying hydrocarbon vapors, an air-inlet, a valve and automatic mechanism operated by the moving portion of the gas-holder for opening said valve fully when illuminating-gas is required in the holder, and closing the same entirely when the requisite supply has passed to the holder, substantially as set forth.

2. A valve actuated automatically, substantially as specified, in combination with the jet-nozzle, air-induction openings, and mixing-tube, substantially as set forth.

3. A hydrocarbon vapor-generating apparatus heated by artificial heat, a connection to the liquid hydrocarbon supply, a jet-nozzle, a mixing-tube and a gas-holder, in combination with an automatic valve and a connection to the moving portion of the gas-holder to entirely open or close the valve with rapidity, substantially as set forth.

4. A gas-generator heated by a portion of its own contents, in combination with an automatic intermitting valve and an atmospheric induction, substantially as set forth, for mixing hydrocarbon vapor and atmosphere with uniformity, regardless of the quantity of illuminating-gas that is being consumed, as specified.

5. The cylinder *c* connected with the inclosed tank D, to show the height and pressure of the contents of the tank, and to convey part of them to the heating-chamber, as specified.

6. The combination with each other of the four separate vessels A, B, D, and I, the latter having the elastic diaphragm J stretched across it, substantially as herein shown and described.

7. The device for automatically operating the valve *s*, which regulates the flow of gas into the gas-holder I, said device consisting of the diaphragm J, pin *o*, lever L, lever *t*, arms *w x*, and springs *y*, all arranged, combined, and operating substantially as herein shown and described.

8. The cam *z* for keeping the valve *s* closed, as set forth.

9. The pipe *f'* for conducting illuminating-gas from the gas-holder I to the heating-chamber *a*, substantially as and for the purposes herein shown and described.

5,248.—*Flour-Sifter.*—LUCY S. NOURSE, Barre, Mass., assignor to H. A. HILDRETH and W. J. JOHNSON.—Patent No. 110,673, dated January 3, 1871; antedated December 17, 1870.

The sifter is pressed down into the flour and worked alternately to the right and left till filled. The flour can then be carried in the sifter or shaken through again.

Claim.—1. The sieve, having a body, A, of wire-cloth, a rim, B, and an operating-handle, adapted for sifting through the interstices of the body inward from the outside, substantially as specified.

2. The combined sieve and measure herein described, having its bottom and sides of wire-cloth, a rim, B, and operating-handle, arranged and adapted for use, as specified.

3. A sieve having the body A formed of wire-cloth pressed into a dish-shaped receptacle, smaller at its bottom than at its top, with outwardly-inclined surface arranged to present all the openings of the cloth to the substance to be sifted, as the sieve is passed downward, substantially as specified.

5,249.—*Machine for Finishing Horseshoe-Nails.*—HARRY A. WILLS, Vergennes, Vt., assignor to JULIA A. WILLS and LUCY S. KINGSLAND.—Patent No. 122,870, dated January 16, 1872.

The nail is fed along by means of a screw and is turned to a horizontal position by passing over a curved plate. A pusher feeds the nail horizontally into a pair of dies, where it rests, while a roll runs over its upper surface from the head toward the point to give the finished shape.

Claim.—1. The combination of the scroll-shaped or approximately scroll-shaped guide B C with the feed-screw, substantially as specified.

2. The combination of the horizontally-acting pusher G with the roller and bed dies, the said pusher and roller-die and the operating devices therefor being arranged in such relation that said die is first caused to advance over the bed-die, and the nail then fed forward, point foremost, beneath the roller-die, until its head comes in contact with it, when the backward movement of the roller-die is commenced, in the manner herein described.

3. The combination of the pivoted or swinging head-holder with the bed-die and roller-die, substantially as specified.

5,250.—*Lining for Wooden Horse-Collars, &c.*—DEXTER CURTIS, Sun Prairie, Wis.—Patent No. 126,682, dated May 14, 1872.

Claim.—A sheet or plate zinc lining or facing for wooden horse-collars and ox-yokes, substantially as described, for the purpose specified.

5,251.—*Lining for Horse-Collar Caps and Harness.*—DEXTER CURTIS, Sun Prairie, Wis., assignor of one-half interest to HENRY GILMAN and GEORGE H. RICHARDS.—Patent No. 125,917, dated August 2, 1870.

A horse-collar cap and other harness are lined with zinc, which has curative properties.

Claim.—1. The horse collar cap, consisting of the curved metal plates A B, secured together substantially as described, so as to leave an air-passage between them, for the purposes specified.

2. A lining for the parts of a harness, struck up or otherwise formed in one piece from sheet or plate metal having a zinc surface, and shaped to the part of the harness to which it is to be applied, substantially as described, for the purposes specified.

5,252.—*Recording Steam-Gage.*—DAVID P. DAVIS, Jersey City, N. J., assignor of one-half interest to GILBERT J. HUNTER.—Patent No. 66,307, dated July 2, 1867.

The steam-gage is provided with a pencil operated by the spring-diaphragm, and a revolving time-dial moved by clock-work, in addition to the ordinary pressure-index and fixed dial.

Claim.—The indicating-hand and dial, the marker and moving recording-surface, in combination with the actuating-diaphragm, substantially as specified, whereby the hand and marker are simultaneously actuated by the pressure, substantially as set forth.

5,253.—*Sash-Lock.*—GEORGE MCGREGOR and GEORGE VOLL, Cincinnati, Ohio, assignors, by mesne assignments, to WILLIAM A. HOPKINS and FREDERICK Z. DICKINSON.—Patent No. 82,318, dated March 30, 1869.

The swinging lever, which locks together the two meeting-rails of a sash, carries within its inner arm a spring-bolt, the end of which works against a catch upon its plate and thus secures the lever from turning. This is all accomplished by devices independent entirely of the catch-plate upon the opposite rail.

Claim.—The combination, with the oscillatory lever and the plate to which it is pivoted, of the spring-bolt F and catch-segment *e*, or their equivalents, whereby the locking of the said lever to the said plate is effected, substantially as and for purpose set forth.

5,254.—*Medical Compound for Lung and other Diseases.*—WILLIAM TRINDER, Philadelphia, Pa.—Patent No. 132,149, dated October 8, 1872.

Lactic acid, phosphate of lime, gum arabic, sugar, glycerine, cod-liver oil, lime-water, oil myrrhbane.

Claim.—1. The combination of lacto-phosphate of lime and cod-liver oil.

2. In combination with the elements of the first claim, the use of gum arabic, for the purpose set forth.

3. Lacto-phosphate of lime and cod-liver oil prepared as an emulsion, substantially as set forth.

4. The above-described compound composed of the ingredients substantially as set forth.

INDEX OF INVENTIONS PATENTED JANUARY 21, 1873.

[The numbers in parentheses denote the classification of patents.]

Bending sheet metal, machine for, (136,) J. Pearce 135,150
Billiard table cushion, (143,) H. W. Collender, (reissue) 5,241
Blackboard, (146,) T. J. Thorp 135,049
Blind slat adjuster, (30,) W. B. Sloan 135,166
Blind opener and slat regulator, (24,) A. Ball 135,061
Boiler, farmer's, (59,) A. B. Nott 135,005
Boiler feeder, steam, (148,) J. H. Blessing 134,972
Boiler attachment, wash, (136,) H. Bickel 135,069
Boiler attachment, wash, (136,) R. A. McCauley 134,999
Boiling apparatus, steam, (154,) E. Moneuse 135,142
Boot and shoe, lasting, (16,) R. C. Lambart 135,133
Boot and shoe rivet, (16,) P. West 135,051
Bottle label, (146,) H. Frank 135,034
Box, packing, (63,) L. A. Fullgraff 135,108
Box, spool, (38,) J. C. Bohn 135,071
Brick, reversible curb, (30,) E. Linson 134,994
Broiler, (154,) W. T. Howard, (reissue) 5,240
Brush, (32,) J. S. White 135,053
Brush handle, (32,) R. S. Craig 135,090
Buckle, trace, (23,) de Silva and Benjamin 135,093
Buildings, construction of, (4,) W. J. Morden 135,044
Can, oil dripping, (67,) L. R. Boyd 135,072
Candy, medicated, (135,) S. B. Colton 134,979
Car brake, (122,) W. H. M. Sanger 135,161
Car brake, railway, (122,) L. Stebbins 135,017
Car starter, (122,) J. J. Wheeler 135,187
Car windows, spring attachment to (31,) G. Cornwall 135,086
Cars, coupling for steam heating apparatus for railroad, (122,) McDuffey and Jaques 135,137
Carburetor, (27,) H. S. Maxim, (reissue) 5,247
Carbureting air, machine for, (27,) J. H. Van Houten 135,020
Carding machine, condensing tube for, (142,) A. W. Skinner 135,015
Carriage axle and axle box, (31,) R. A. Berryman 135 068
Chevron, (38,) F. S. Johnston 135,124
Cigar bunches, retainer for pressed and molded, (160,) W. D. Brewer 135,030
Cigar bunches, retainer for pressed and molded, (160,) W. D. Brewer 135,031
Cigarettes, device for making, (160,) H. Gerike 135,110
Cisterns, &c., rain water, switch and reversible valve for, (126,) L. Goudreau 135,035
Clothes drier, (91,) E. S. French 135,107
Coffin, (39,) P. E. Ober 135,006
Coffin plate, (39,) G. B. Ransom 135,155
Column, wrought iron, (4,) L. Horman 134,987
Cooler, milk, (45,) S. Spencer 135 169
Cork cutting machine, (176,) T. S. Disston 134,982
Corn sheller case, (59,) A. Borneman 135,029
Corset, (89,) S. Drixon 135,097
Corset steel, (89,) C. S. Chaffee 135,079
Cradle, (62,) L. Heywood 135,117
Cradle or crib, folding, (62,) M. McNamara 135,138
Crank movement, (79,) H. C. Bradford 135,073
Culinary pot, (154,) Kidd and Melville, (reissue) 5,246
Cultivator, (43,) C. Billups 135,070
Cultivator, (43,) J. H. Pattee 135,148
Cultivator, (43,) Z. B. Sims 135,165
Cultivator, rotary, (43,) J. W. Milroy 135,002
Cultivator, sugar cane, (43,) A. Trouard 135,174
Curtain fixture, (62,) G. B. Cowles 134,980
Cutlery, table, (44,) C. McDonald 135,136
Cutlery, &c., metallic compound for coating, (113,) J. Zimmer 135,028
Dam, self-acting, (82,) H. Werner 135,023
Damper regulator, (154,) E. Fitts 135,103
Dental drill, automatic, (48,) M. I. Gallager 135,109
Desk, school, (62,) Cox and Fanning 135,089
Desk, school, (62,) C. H. Prosbrey 135,154
Diamonds, method of setting black, (68,) T. W. Baxter 134,968
Digger, potato, (114,) W. H. Wall 135,183
Ditching machine, (114,) J. W. Humphreys 134,991
Door check, (24,) A. Hanna 135,115
Door fastening, barn, (24,) Wright and Roys 135,027
Doors, gates, &c., spring for, (24,) R. Espey 135,192
Dredge box, (72,) T. Smith 135,048
Drill teeth, grain, (133,) J. D. Welsh 135,186
Earth closet, (8,) R. S. Williams 135,026
Eaves trough hanger, (126,) J. P. Abbott 135,056
Elevator, water, (150,) T. Fowlds, Jr 135,101
Elevator and injector, steam water, (150,) A. W. Cram 135,091
Engine, hydro-steam, (150,) J. Widmer 135,024
Engine coudenser, steam, (150,) G. Wales 135,140
Engine, traction or portable, (150,) D. W. Kellogg 135,128
Engines, valve gear for steam, (152,) J. W. Hackworth 135,036
Excavator, (51,) F. W. Schultz 135,162
Feeding screen for fan dusters, (57,) G. S. Cooper 135,085
Fence, iron, (52,) J. R. Wickersham 135,188
Fence, self-locking rail, (52,) A. Bagley 134,967
File, paper, (146,) R. Mots 135,144
File holder, newspaper, (146,) W. Bright 134,974
Files, machine for cutting, (53,) C. Vogel 135,179
Fire proof paper for roofs, &c., (126,) R. U. Piper 135,153
Fire proof compound for coating roofs, &c., (126,) R. U. Piper 135,152
Fish bait compound, (143,) S. A. Goodman, Jr 135,113
Forging frows, die for, (60,) C. Konold 134,993
Fruit box, (63,) E. P. Bothwell 134,973

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COMMISSIONER'S DECISIONS.

COLLENDER *vs.* GRIFFITH.—*Interference.*

[*Appeal from the Principal Examiner in the matter of the interference between the application of H. W. Collender, for alleged* IMPROVEMENT IN BILLIARD-TABLES, *and the patent of W. H. Griffith, for a* DESIGN FOR BILLIARD-TABLES, *granted October 24, 1871. Decided January 30, 1873.*]

INTERFERENCE IN DESIGN CASES.

If an application is filed for a mechanical patent for a construction, and if a design for which a patent has been granted can be produced only by that construction, an interference should be declared between the application and the patent.

THACHER, *Acting Commissioner:*

This is an appeal from a decision of the Examiner dissolving the interference. The main reason for the dissolution is that an interference is improper between an application for a mechanical patent and a patent for a design.

This is urged on the ground that the interests are not and cannot be identical, inasmuch as the patentee of the design cannot reissue and obtain a claim for the construction, even if successful in the suit. Although this argument appears plausible, it is really unsound and should not prevail. An interference does not *necessarily* result in the grant of a patent to one of the parties for the subject-matter involved. It frequently happens that the prior inventor is adjudged, for various reasons, not to be entitled to a patent. The question in this case is not whether Griffith is entitled to a patent, but whether Collender shall have the patent for which he prays. Now, it is admitted that Griffith in applying his design must use the construction claimed by Collender, and therefore the grant to the latter of the patent sought would subordinate a design patent of earlier date. Under these circumstances it is perfectly evident that it would be improper to issue a patent to Collender until he proves himself the prior inventor. An interference, therefore, was necessary, and in this instance properly declared.

The decision of the Examiner dissolving the interference is overruled.

CHAS. G. DICKINSON.—*Extension.*

[*In the matter of the application of Charles G. Dickinson for the extension of Letters Patent No. 20,786, for* IMPROVEMENT IN HARVESTERS, *granted February 1, 1859.—Decided January 31, 1873.*]

EXTENSIONS OF REISSUED PATENTS.

Where an assignee of a patent has had it reissued, and the inventor has accepted an assignment of one-half of the reissued patent, he cannot have an extension of the original.

THACHER, *Acting Commissioner:*

The following facts, among others, appear in this case: In 1868 Dickinson assigned to J. R. Parsons all his right in the patent, "and in all extensions and reissues of the same." Although Dickinson was not at that time the owner of the entire interest in the patent, by the terms of the assignment all interest in an extension was transferred to Parsons. In May, 1871, Parsons surrendered and reissued, the new patent being granted to him as assignee.

To enable him to apply for an extension, applicant has obtained from Parsons a re-transfer of one-half his interest in the invention. He petitions for the extension of the original patent, and bases his right to the same on the fact that the reissue was obtained without his knowledge and consent, and that he never has taken an interest therein. If this was the fact the application would be proper, and the prayer of petitioner, the testimony being sufficient, might be granted.

In the re-assignment to Dickinson, however, Parsons transfers to him "one undivided half part of my entire

interest in said invention and letters patent issued therefor." Now, the only patent in which the assignor had an interest at the time of making this instrument was the reissue obtained by him, and it is evident, therefore, from the terms of the assignment, that by the transfer the assignee became invested with a one-half interest in the reissued patent. Judge Blatchford, in *Potter* vs. *Braunsdorf*, 7 Blatchford, 97, where the extension of an old patent which had been reissued was declared valid, bases his decision upon the fact that the original patentee had never assented to the reissue or acquired any title thereunder. This is set forth so distinctly as to authorize the conclusion that the converse must be true—that is, if the inventor by any act of his own has adopted the reissue, or in any way assented thereto, the extension of the original patent would be invalid. The purchase by the original patentee of an interest in the reissued patent stamps the act of surrender and reissue with his approval; an assent in words could not be stronger.

I have come to the conclusion, therefore, that the extension of the original patent in this case would be invalid, and the prayer of the petitioner must consequently be denied.

W. W. LEWIS.—*Extension.*

[*In the matter of the application of W. W. Lewis for extension of reissued patent No. 3,354, for* HORSESHOE-MACHINE, *granted March 30, 1869, original patent granted February 1, 1859.—Decided January 30, 1873.*]

Although a claim was originally allowed by the Appellate Court, yet the patent embracing it will not be extended until it is disclaimed, if the device is found to be an old one on references which were not before the Court.

The extension of a patent embracing a combination claim will not be refused on the ground that the elements specified do not co-operate, if the claim was originally allowed by the Appellate Court.

Testimony tending to sustain the applicant's case in chief will be excluded if taken on the rebuttal, although under a special order enlarging the time, but reserving the question of admissibility, if no reason is shown for its not being taken before.

There is no more reason in extension cases than in others that are contested for relaxing the rules for taking testimony, which are founded on principles of law and practice.

Less than $5,000 held to be an inadequate remuneration for a meritorious invention.

THACHER, *Acting Commissioner:*

The nature and objects of this invention are set forth in the specification as follows:

"Prior to my invention horse and oxshoe iron has been produced by machinery consisting of two rollers mounted or dressed with grooves and creasers, or of four rollers properly dressed for giving configuration to the iron from which the shoes are to be formed; but in these and all prior devices the principle upon which my improvements are founded is overlooked.

"Where iron is rolled in a plain grooved roller, in which the cross-section of the groove is a parallelogram, and a creaser is applied during the process of rolling, it is evident that the iron displaced by the creaser must be fixed against the sides of the groove. To accommodate this expansion, some play is allowed between the iron and the sides of the groove, or, in other words, the iron does not fit tightly in the groove. But it is evident that if any play be allowed, it becomes necessary to guide the iron in some way, so as to form the depression for the nails or crease in a line that is exactly parallel with the side of the shoe, as a variation from this parallelism would destroy the workmanship of the manufactured article.

"For the purpose of obviating this difficulty I place an inclined plane in the bottom of the groove opposite the creaser. The effect of this is to press the iron toward the opposite side of the groove, where the creaser operates, and to keep it against that side, which thus serves as a guide to preserve the parallelism. The effect is also to make the outer edge of the iron, which contains the crease, thicker than the inner edge, which is the natural form of the shoe.

"I also make the bottom of the groove eccentric, so as to make the shoe thicker at the heel than at the toe, and this will be effected, although the bar is of uniform thickness, when fed to the rolls, because the iron displaced by the creasers in the shallower portion being unable to escape, because of the lateral pressure against the sides, must be forced toward the ends where it will occupy the full depth of the groove.

"I place the creasers in the rolls in the form of a ring where the whole roll is used, or of a semi-ring where but half the circumference is employed. In the latter case I cut the roll radially so as to remove and replace one side of the roll opposite the creaser. This enables me to remove the creasers when they become worn or imperfect, or to substitute different sizes, as may be desired."

The claims are as follows:

"1. The combination, in a pair of rolls, of a groove with an inclined bottom and one or more creasers, for the purpose of guiding the iron and producing a thicker edge on the outside of the shoe, substantially as described.

"2. The combination of a pair of grooved rollers with one or more creasers, when the bottom of the groove or rolling surface of either roll is eccentric, so as to make the shoes thicker at the heels than at the point or toe, substantially as set forth.

"3. The combination, with a pair of rolls, of annular adjustable creasers, substantially as described."

A careful examination of the references cited shows that the first and second claims are not anticipated, and that, so far as mere inspection indicates, the combinations they embrace are of substantial utility. It is apparent from the specification that the word "adjustable" in the third claim signifies *removable*. I agree with the Examiner that this claim is fully anticipated. True, it was granted by the Court, but two of the references cited by the remonstrant do not appear to have been before the Court. The references and the testimony as to the use of rolls with creasers by Wheeler, at Fentonville, in 1853, are fatal to this claim. The point is made in behalf of the remonstrant that the parts claimed in the first and second claims do not co-operate in such a sense as to render them, as shown and claimed, a legal combination. In my opinion this point is not well taken. The object of the machine is to produce a horseshoe blank at one operation, so shaped as to be readily finished into a marketable horseshoe. Admitting, as maintained, that each feature claimed will perform its function as well independently of the other or the others, yet by acting in conjunction they co-operate to accomplish the single object of the machine, viz., to form the blank at one operation. There is not an aggregation of parts to accomplish different objects independently, but the parts combine to accomplish a single purpose by one process or operation. If this were not my opinion I should not, in view of the fact that these claims were granted by the Court, feel at liberty to question their legality.

After applicant and remonstrant had closed their testimony, the former made a motion for extension of time for the purpose of taking testimony in rebuttal, and also for the purpose of examining certain witnesses at Portsmouth, Ohio, whose testimony, it was alleged, could not be taken at the time testimony-in-chief was taken. The motion was granted on condition that the question of the admissibility of the testimony should be left open to be determined at the hearing. No objection appears to such of it as is strictly in rebuttal of that of the remonstrant. That which goes to prove applicant's case-in-chief, and to contradict one of h's own witnesses-in-chief, I need hardly say is inadmissible. No sufficient reason was shown why this testimony could not have been taken during the time originally allowed, and the requirements of the rules in other respects were not complied with. In a contested case for extension of a patent there is no more reason for a relaxation of the rules for taking testimony—which are intended to be based on principles of law and practice—than there is in any other contested case.

The testimony-in-chief of the witness Green is not positive to the effect that the Portsmouth machine has not a beveled groove, and there is enough evidence to satisfy my mind, without his subsequent correction, that the machine was constructed with a beveled groove, and substantially as set forth in the specification of the patent. (W. H. Carruthers, Int., 3.) The testimony of experts in behalf of remonstrants, as to the impracticability and inutility of the Lewis machine, is extremely weak in itself, and is wholly overthrown by the rebutting testimony. The diligence of the inventor has been exemplary, and the utility, value, and importance of his invention are rather made apparent by the vigorous interested opposition of the remonstrant than adversely affected. Less than five thousand dollars appears to have been realized by Lewis from his invention, and I regard this as much too small a reward.

I find this application in all respects a meritorious one, so far as the first and second claims are concerned, and with a disclaimer of the third claim the extension will be granted.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

THE LOCOMOTIVE-ENGINE SAFETY-TRUCK COMPANY *vs.* THE ERIE RAILWAY COMPANY.

[*In Equity.—Before Blatchford, Judge.—Decision December 30, 1872.*]

PATENT OF A. F. SMITH, FEBRUARY 11, 1862, FOR TRUCKS FOR LOCOMOTIVES—CLAIM OF PATENT AS AFFECTED BY THE TITLE—DOUBLE USE—JURISDICTION.

Smith's patent, "an improvement in trucks for locomotives," construed to be for the use in and the combination with a locomotive-engine—that is, a structure having at its rear end, not a swiveling truck, but non-swiveling driving-wheels with axles rigidly attached to the body of the engine—of a swiveling pilot or leading truck, provided with pendent links to allow the forward part of the engine to move laterally over the truck when the truck and the driving-wheels are not together in a straight track, whereby the forward part of the engine can move onward in a line tangent to a curve, while the axles of the driving-wheels are parallel, or nearly so, to the radial line of the curve, because the truck is made to swivel around the king-bolt by the action of the rails on the flanges of the truck-wheels.

The prior use of two such trucks *upon a car*, as described in the Kipple & Bullock patent, does not anticipate the use of one such pilot-truck, in combination with the driving-wheels of a locomotive fixed upon axles rigidly secured to the frame.

Smith's combination of truck-wheels with the rigid drivers of a locomotive produces a new mode of operation and new results in the structure as a whole, although the truck, as respects itself, in swiveling and in having a lateral movement, operates in the same way it did in the car which had two of such trucks.

Smith's invention, in which the truck not only admits of a swinging motion across the track of the engine over the truck, or the truck under the engine, but also has a swiveling motion on its axis, is substantially different, in operation and result, from the Bissell locomotive, in which the absence of free swiveling in the truck around its center prevents the action of the rails on the flanges of the truck-wheels from regulating the position of the axles on a curve.

The title of Smith's patent, "an improvement in trucks for locomotives," does not require that the claim should be one to an invention in respect to the truck *per se*.

An allegation of "making and using" is proved, to all intents and purposes, by proof of using alone.

Infringement by *use in the Southern District of New York* having been established, complainants are entitled to a decree for an accounting by the defendants, in respect of all infringements in said district, by making or using or vending, and to an injunction against making in said district, and against using therein, and against vending therein.

The defendants being suable in the Northern District of New York, the complainants, if they desire an accounting and injunction there, must proceed by bill filed in that District.

A suit in equity, brought by the Locomotive-Engine Safety-Truck Company, a corporation in the city of New York, against the Erie Railway Company, for an alleged infringement of the patent of Alba F. Smith, granted February 11, 1872, for an "improvement in trucks for locomotives."

[*Keller & Blake*, for complainant.
C. A. Seward, for defendant.]

BLATCHFORD, *Judge:*

This suit is founded on letters patent granted to Alba F. Smith, February 11, 1862, for an "improvement in trucks for locomotives." The specification describes the invention as an "improvement in trucks for locomotive-engines." It says:

"Several laterally-moving trucks have been made and applied to railroad cars. My invention does not relate broadly to such laterally-moving trucks, but my said invention consists in the employment, in a locomotive-engine, of a truck or pilot wheels, provided with pendent links to allow of a lateral movement, so that the driving-wheels of the locomotive-engine continue to move correctly on a curved track, in consequence of the lateral movement allowed to said pendent links, the forward part of the engine traveling as a tangent to the curve, while the axles of the drivers are parallel, or nearly so, to the radial line of curve. In the drawing I have represented my improved truck itself. The mode of applying the same to any ordinary locomotive-engine will be apparent to any competent mechanic, as my truck can be fitted in the place of those already constructed, or the same may be altered to include my improvement."

The truck has four wheels on two axles, and a frame made in the usual manner of the frame of an ordinary locomotive-truck. It has a center cross bearing plate or platform, made of two thicknesses of iron plate riveted together, and embracing the upper bars of the frame, and a bolster made of a flanged bar, through a hole in the center of which the king-bolt passes. The king-bolt also goes through an elongated opening in the bearing-plate, to allow lateral motion to the truck beneath the bolster. At the same time the king-bolt is a connection to hold the truck to the engine. The bolster takes the weight of the engine in the middle, and is itself suspended at the ends of bars attached to the moving ends of pendent links, which are attached by bolts at their upper ends to brackets on the frame. The distance between the bars, transversely of the truck, is slightly more than that between the bolts, so that the pendent links diverge slightly. The specification says:

"When running upon a straight road the engine preserves great steadiness, because any change of position transversely of the track, in consequence of the engine moving over the truck or the truck beneath the engine, is checked by the weight of the engine hanging upon the links, and, in consequence of their divergence, any side movement causes the links on the side toward which the movement occurs to assume a more inclined position, while the other links come vertical, or nearly so. Hence, the weight of the engine acts with a leverage upon the most inclined links to bring them into the same angle as the others, greatly promoting the steadiness of the engine in running in a straight line. As the pilot or truck-wheels enter a curve, a sidewise movement is given to the truck in consequence of the engine and drivers continuing to travel as a tangent to the curve of track. This movement and

the slight turn of the whole truck on the king-bolt not only causes the truck-wheels to travel correctly on the track, with their axles parallel to the radial line of the curve of track, but also elevates the outer side of the engine, preventing any tendency to run off the track upon the outer side of the curve. Upon entering a straight track the truck again assumes the central position, and, in case of irregularity in the track or any obstruction, the truck moves laterally without disturbing the movement of the engine. I do not claim laterally-moving trucks nor pendent links, separately considered."

The claim is:

"The employment, in a locomotive engine, of a truck or pilot-wheels, fitted with the pendent links *o o* to allow of lateral motion to the engine, as specified, whereby the drivers of said engine are allowed to remain correctly on the track, in consequence of the lateral motion of the truck allowed for by said pendent links, when running on a curve, as set forth."

The proof shows that the defendants have used, in this District, an engine built by them at Dunkirk, in the Northern District of this State, which has four flanged driving-wheels and contains the invention claimed in Smith's patent. The issue is as to the novelty of the invention. In order to determine this question it is necessary to clearly see what invention is claimed in Smith's patent.

He does not claim laterally-moving trucks—that is, trucks with laterally-swinging bolsters. Nor does he claim pendent links, by themselves. Laterally-moving trucks applied to railroad cars which had at each end one of such trucks, free also to swivel around a king-bolt which connected the car to the truck and passed through the center of the swinging bolster, which was the center of the truck, were old. The specification so admits. But Smith's invention, as claimed, is for the use in, and the combination with, a locomotive-engine—that is, a structure having at its rear end, not a swiveling truck, but non-swiveling driving-wheels, with axles rigidly attached to the body of the engine—of a swiveling pilot or leading truck, provided with pendent links to allow the forward part of the engine to move laterally over the truck when the truck and the driving-wheels are not together in a straight track, whereby the forward part of the engine can move onward in a line tangent to a curve, while the axles of the driving-wheels are parallel, or nearly so, to the radial line of the curve, and the axles of the truck-wheels also become parallel to the radial line of the curve, because the truck is made to swivel around the king-bolt by the action of the rails on the flanges of the truck-wheels.

In going around a curve with a locomotive-engine the axles of the two pairs of driving-wheels tend to assume a parallelism to that radius of the curve which is equidistant between the two axles. If the pilot-truck has no lateral swing to its bolster, but merely swivels on the king-bolt, the tendency of the action of the truck-wheels on a curve is to force the king-bolt into a position over the center of the track. That action is resisted by the body of the engine, and to accomplish it the driving-wheels must be twisted out of their proper position, and must slip and grind on the rails. The reason of this is that a line drawn longitudinally through the center of the engine, at right angles to that radius of the curve which is equidistant between the two axles of its driving-wheels, will not strike the king-bolt at the center of the track unless the driving-wheels are so caused to slip. Hence it was customary, with a pilot-truck which only swiveled and had no lateral swing to its bolster, to make the front driving-wheels without flanges, so that they might slide sidewise. But the antagonism is reconciled by allowing the king-bolt and the forward end of the engine to move laterally, so as to keep in a line substantially at right angles to the axles of the driving-wheels and outside of the center of the track, the king-bolt being no longer controlled in its position by the truck, and there being no twisting of the driving-wheels out of position.

Another feature developed in the use of the pendent links is pointed out in the specification, which is, that on entering a curve the outside of the engine, as the truck moves inward laterally under it, is elevated so as to counteract any tendency to run off of the track on the outside by the centrifugal motion, and as the mode of hanging the links causes the link on the outer side to assume a more inclined position, while the other link becomes more nearly vertical, the weight of the elevated engine acts to steady the engine and restore it to a position midway between the rails on returning to a straight track. This feature of the links also acts to keep the engine steady when on a straight track.

The patent granted to Bridges and Davenport, May 4, 1841, for an "improvement in railway carriages," shows a swinging bolster in a truck swiveling on a king-bolt, the body of the car being connected to the truck-frame by pendulous links, from which such body is hung, whereby a lateral motion of the truck is permitted, independently of the body of the car, the sidewise motion being checked by springs in the truck. But the specification of that patent does not suggest the use of such a truck in any other structure than a car having one of such trucks at each end and two king-bolts. Nor did it, or the use of two of such swinging bolsters in a car, suggest, from 1842 to 1862, the combination of such a swinging bolster-truck with a locomotive-engine, for the purpose set forth in Smith's specification.

In the truck described in Smith's specification the side springs of Bridges and Davenport are dispensed with, the divergence of the pendent links being used instead to check the sidewise movement. This precise construction of divergent links is shown in the patent granted to Kipple and Bullock, December 20, 1859, for an "improvement in car-trucks." Their use has the tendency to elevate the outside of the car on a curve, and the tendency to steady the body of the car through its weight on the links that are most inclined, and the tendency to limit the lateral movement without using side springs. But although the mode of operation of a Kipple and Bullock truck, *per se*, in a car having a like truck at its other end, is the same, for all the purposes of the truck itself, that it is in a structure which has driving-wheels at the other end, yet the moment the truck swiveling on the king-bolt is taken out of the other end of the structure, and driving-wheels takes its place, the mode of operation of the structure as a whole becomes different from the mode of operation of the structure with the two swiveling trucks. This is conceded by the expert for the defendants, and is quite manifest. The mode of operation becomes such as is described in Smith's specification, and no such mode of operation exists in the structure with the two trucks. Moreover, the existence of the Kipple and Bullock patent, and the use of cars each with two of their trucks, does not seem to have suggested, before the invention of Smith, the use of one of such trucks as a pilot-truck in a locomotive-engine to obviate the well-known difficulties in using the engine on a curve.

The only other pre-existing invention brought up to affect the novelty of the Smith invention is the patent granted to Levi Bissell, August 4, 1857, for an "improvement in trucks for locomotives." Bissell's truck is shown under the forward part of a locomotive-engine. It has a provision designed to allow a lateral motion to the truck independently of the motion of the body of the engine, and a provision to cause the forward part of the engine to mount up an incline toward the outer side, in a curve, and thus check the sidewise movement, and to descend by its gravity to the normal position on resuming the straight track. The specification of Bissell's patent says that the object of his invention is "to retain the truck with the axles always at right angles to the rail, whether on a straight or curved track, and prevent the truck swinging around on its center pin in case of meeting with any obstruction, and to make the curvature of the rail the means for turning the truck, so that the axles are parallel to the radial line of the given curve, in which position they are retained firmly until the direction of the track again changes." The specification then points out the difficulties in the use of locomotive-engines on curves with the ordinary pilot-truck, resulting in a "constant sidewise sliding motion on the rail," in consequence of the driving-wheels being forced in a line deflected from that of a cylindrical forward rolling motion, and in a constant bearing of the truck to the outer side of the curve, and in the tendency of the engine to go off the track, "particularly in case a broken rail or obstruction occurs, when the truck swivels around on its center-pin." It then proceeds:

"I therefore construct my truck in such a manner that the axles of the driving-wheels shall be on the line of, or parallel to, the radial line of the curve, so as always to have a direct forward propelling motion, and not strain or wear the rail or flanges of the wheels, and so that two or more pairs of drivers can be fitted with flanges. Consequently, the center line of the locomotive, in going around a curve, travels as a tangent to the center of the drivers, and to accommodate the curve I fit the truck or forward wheels in such a manner as to allow of a transverse motion, the said truck swinging laterally upon an axis of motion, *A*, located centrally between the center of the drivers and truck, (or slightly forward of the same,) so as to give a slight tendency to the truck to run to the inner side of the curved track. Thereby the axles of the truck-wheels are parallel (or nearly so) to the radial line of the curved rail, and the engine runs around any given curve without much more strain, either on the wheels or the track, than would occur on a straight railroad; and at the same time there is no chance for the truck to turn on its center-pin by any obstruction coming in contact with the wheels, and the wheels will pass over a broken rail and not be displaced unless all four wheels are simultaneously unsupported, and even then the wheels and truck, being set correctly to the angular position with the drivers and the curvature of the track, will continue to move in the correct direction, and pass over any obstacle or broken rail and attain the uninjured part of the track; and in running on a straight track the truck is held correctly in position, and will run over quite considerable obstruction without being turned aside. In running on either a straight or curved track one of the truck-wheels often breaks off, and the truck swivels around on its center-pin in consequence, and throws the engine off the track; but with my device one wheel, or even the two wheels on the opposite sides diagonally of the truck, might break off, and still the truck would not run off, because its position is set and it has no axis of motion around which it could swing when injured as above stated, or when meeting a broken rail or any obstruction, but is given a direct forward propulsion; and in all cases the axles of my wheels have only a strain and tension due to the difference of length between the outer and inner rails, instead of a strain due to the binding of the flanches of the wheels from the diagonal position of the axles, in addition to the above-named strain. Hence axles so often break when running around a curve. With my engine the friction on the rails in running around curves is avoided, and I am enabled to maintain a nearly uniform speed without any unusual strain or wear on any parts."

The specification of Bissell then describes the construction of his apparatus, with references to drawings. It says that the center-pin (which is the king-bolt in the center of the truck) in his arrangement "changes its character from a center of motion simply to that of a draft block or pin, while the center of motion is thrown back to the point *A*, which is slightly forward of the center between the drivers." There is at the center of the truck a block whose longest direction is across the track, and whose longest sides are parts of circles of which *A* is the center, or, as the specification expresses it, "curved from the center *A*." There is a similar curved slot in the top plate of the truck-frame, which slot is sufficiently long to allow of the lateral movements of the truck when the locomotive is on a curve of the smallest radius that it ever has to travel over. The curved block might, it is stated, be bolted directly to the under side of the engine, and the curved slot would bring the axles of the wheels parallel with the radial line, or nearly so; but to allow an easier motion to the parts, the block may be prevented from turning by radius bars leading to the center *A*. The patentee states, however, that he prefers that the radius bar should be attached to the truck-frame so as to cause the truck to swing on the center *A*, in which case the curved block may be made use of or the center-pin be fitted to move in a curved slot. He then describes the arrangement and use of the inclines before mentioned to check the lateral motion.

It is apparent that the truck in Bissell's locomotive has no swiveling motion around its center-pin or king-bolt—that is, around the center-pin in the center of the truck which connects the truck with the engine. Bissell expressly states that such center-pin loses its character as a center of motion, and becomes simply a draft block or pin, and that the center of motion of the truck—that is, its only center of motion—is thrown back to the point *A* outside of the truck. He further says that, although his truck has a center-pin, it has "no axis of motion around which it could swing." It has only a motion in the arc of a circle, of which the pin *A*, located between the truck and the driving-wheels, is the center, such motion being a swinging motion of the whole truck across the track. It follows, inevitably, that the position of the pin *A* regulates the position of the axles of the truck relatively to the track, and that the absence of free swiveling in the truck around its center prevents the action of the rails on the flanges of the truck-wheels from regulating the position of such axles on a curve. When the pin *A* is equidistant between the center between the axles of the driving-wheels and the center between the axles of the truck-wheels, the axles of the truck-wheels may, on a curve, be in their proper position—that is, parallel to a radius of such curve half-way between such axles. But that is not true in reference to any other position of the pin *A*; and even when the pin *A* is in that position, the axles of the truck-wheels can never be in such proper position when the engine is entering a curve or leaving a curve, or changing from a curve in one direction to a curve in another direction, because the position of such axles depends on the position of the pin *A* with reference to the track, and the driving-wheels control the position of the pin *A*. A geometrical demonstration shows that if the pin *A* be equidistant from the center between the axles of the drivers and the center between the axles of the truck-wheels, the axles of the drivers and the axles of the truck-wheels will, when they are all on the same

curve, be in their proper positions; that if the pin *h* is not thus equidistant, one or the other set or both sets of axles will, on the same curve, be in a wrong position; that when the drivers are on a curve and the truck-wheels are on a straight part of the road, the pin *h* can never be in such a position as to allow the axles of the truck-wheels and the axles of the drivers, all of them, to be in their proper position; and that this holds equally true when the truck-wheels are on a curve and the drivers are on a straight part of the road; and also when the truck-wheels are on one curve and the drivers are on another curve. The action of the drivers, through the pin *h*, is to twist the truck-wheels on the track and control the position of their axles in correspondence with the direction of the longitudinal center line of the engine.

In the engine of Smith the truck-wheels and the drivers can at all times, when the engine is on a curve, and when it is leaving a curve, and when it is passing from a curve in one direction to a curve in another direction, take their proper positions, respectively, without either being controlled or interfered with by the other. The reason for this is that the truck in the Smith engine has a swiveling motion on its king-bolt, and also admits of the swinging motion across the track of the engine over the truck or the truck under the engine. Neither of these motions affects the other. If either motion interfered with the other the same result would follow as in Bissell's engine, and the position of the drivers would at times control the position of the axles of the truck-wheels. But with Smith's arrangement the track alone controls the position of the axles of the truck-wheels, and therefore they assume their correct position on any track, straight or curved, and on any form of curve, and whether the drivers are on a straight track with the truck-wheels, or on the same curve with the truck-wheels, or on a straight track while the truck-wheels are on a curve, or on a curve while the truck-wheels on a straight track, or on one curve while the truck-wheels are on a different curve. This is a result not attained in Bissell's engine, and it results from the fact that the arrangements and modes of operation of the two structures are different. The truck-wheels in Smith's engine are never twisted on the track, and the direction of the longitudinal center line of the engine does not affect the position of their axles.

It results from these considerations that in the engine as a whole the Smith arrangement of truck is not merely an equivalent for the Bissell arrangement of truck, because, when the former is substituted for the latter, the resulting structure has a different mode of operation, and produces results which the other structure cannot produce. The thing to be looked at is the combined and mutual action of the drivers and the truck-wheels, for that was the problem which both Bissell and Smith were trying to solve. Smith's claim is substantially a claim to the combination, with the drivers, of a truck arranged as he describes, allowing of the lateral motion described, and securing the proper position of the drivers on the track on curves. That combination is not found in Bissell's engine.

It needs no argument to show, in view of the foregoing considerations, that there was a patentable novelty in the combination which Smith made in his engine, although the truck which he employed existed before, as the Kipple and Bullock truck. The combination produces a new mode of operation and new results in the structure as a whole, although the truck, as respects itself, in swiveling and in having a lateral movement operates in the same way it did in the car which had two of such trucks. It was not apparent, without experiment, that the use of a swinging-bolster swiveling truck in an engine would relieve all the difficulties attendant on the use of driving-wheels on curves. If it had been, Bissell would have adopted the truck of Bridges and Davenport instead of resorting to the contrivance he made. Hence, what Smith did was not, as is urged, merely to apply an old contrivance in an old way to an analogous use.

It is urged that Smith's patent is void, granted as it is for an "improvement in trucks for locomotives," because, although he may have invented a combination of the truck with a locomotive, yet he invented no improvement in the truck, but used the truck of Kipple and Bullock; that the invention of such combination is the invention of an improvement in locomotives, or of a new locomotive, or of an improved locomotive, or of a combination of truck and locomotive; and that the patent is void as a patent therefor because it is not granted as a patent therefor, but is granted as a patent for an "improvement in trucks for locomotives." In this connection reference is made to the fact that, in his specification, Smith says that figure 1 of his drawing is "a plan of my truck;" and also that "in the drawing I have represented my improved truck itself;" and also that "my truck can be fitted in the place of those already constructed." The body of the specification speaks of the invention as an "improvement in trucks for locomotive-engines." The statute required that the patent should contain a short description or title of the invention, correctly indicating its nature and design. This patent substantially conforms to the statute. As a truck to be used in a locomotive-engine, the truck Smith describes as to be employed is an improvement on Bissell's truck employed in an engine. Smith's invention is an improvement in the use of trucks in locomotive-engines, an improvement in the use, for locomotives, of trucks. It is a new and useful improvement, and the class of inventions to which it belongs, the class which embraces its nature and design, is that of trucks for locomotives, trucks used in locomotives. The claim is to the employment, in a locomotive, of a truck constructed in a certain way and producing a certain result in the action of the drivers on a curve. The title in the patent does not require that the claim should be one to an invention in respect to the truck *per se*. The expression "my truck" in the specification has reference, obviously, when the statement of the nature of the invention and the claim are considered, to the truck which Smith describes as the one he was intending to use in the engine to produce the results specified. The patent, therefore, is not open to the objection thus urged.

The answer sets up that the larger portion of the road of the defendants, and of the operations thereon conducted, is not within the jurisdiction of this Court; that all of the engines built by them which are alleged to infringe the Smith patent were constructed by them at Dunkirk; that the use of said engines is largely confined to the western division of their road; and that such construction and larger use were not, and are not, within the jurisdiction of this Court. It is contended for the defendants that, as the bill avers that they "have constructed and built, and caused to be constructed and built, and are now using trucks for locomotives constructed in accordance with and containing and embodying" the invention patented by Smith, and that the plaintiffs "have reason to believe that they will continue to make and use the same," and that the defendants refuse to pay to the plaintiffs any of the profits which they have realized from "such unlawful making and using," and as the bill prays that the defendants may be decreed to pay to the plaintiffs the profits which they have made "by reason of such unlawful manufacture and use," and may be enjoined "from making, constructing, and using trucks for locomotives constructed substantially in accordance with" the patented invention, the bill is based on the making *and* using in the conjunctive; that its frame is such, therefore, that if the plaintiffs cannot, under it, recover for the making, they cannot for the using; that they cannot, in this suit, recover for the making of the only engine proved to have been made or used by them containing the invention patented, because, although such engine is proved to have been used in this District, it is proved to have been made in the Northern District of this State; that, by the sixth section of the act of April 3, 1818, (3 U. S. Stat. at Large, 415,) the original jurisdiction of this Court is confined to causes arising within this District, and is declared not to extend to causes of action arising within the said Northern District; that the cause of action arising out of the making of such engines is, therefore, not within the jurisdiction of this Court; and that, as the bill is founded on the making *and* using, there can, consequently, be no recovery whatever under it on the evidence as to the one engine.

I do not think these views are sound. They overlook the fact that the bill avers that the defendants refuse "to desist from using" the invention patented; that the grant in the patent is of the right "of making, constructing, using, and vending to others to be used;" that an infringement may be committed by making, or constructing, or using, or vending to others to be used; that an allegation in the bill of making *or* using would be bad pleading; and that an allegation of making and using is proved, to all intents and purposes, by proof of using alone. Indeed, the allegation in the bill that the defendants have "constructed and built, and are now using, trucks for locomotives constructed in accordance with and containing and embodying" the patented invention, is by no means an allegation which necessarily implies that any of the structures which are used by the defendants were built by them, or that any of the structures which were built by them are used by them. It may as properly be read that they have constructed infringing structures, and that they are, also, using infringing structures.

Under this bill, therefore, the plaintiffs, having proved an infringement by the use in this District of the engine referred to, are entitled to a decree for an accounting by the defendants in respect of all infringements committed in this District, by making or using or vending therein, and to an injunction against making in this District, and against using therein, and against vending therein. If the plaintiffs desire to proceed for an account and an injunction in respect of infringements in the Northern District, they must proceed by bill filed there. The defendants are suable in the Circuit Court for that District, their legal existence, under their incorporation by the State of New York, being co-extensive with the territorial limits of that State.

The first section of the act of May 4, 1858, (11 U. S. Stat. at Large, 272,) which provides that "all suits not of a local nature hereafter to be brought in the Circuit and District Courts of the United States, in a District in any State containing more than one District, against a single defendant, shall be brought in the District in which the defendant resides," has no application to this case. Although this suit is one not of a local nature—that is, is what, if it were a suit at law, would be a transitory action—yet the act has no application to a case where the single defendant resides as fully in all the districts in the State as in any one of them. A corporation, if it can be properly said to "reside" at all, resides in all the districts of the State creating it. It is doubtful whether the act applies to corporations.

A decree will be entered in accordance with the foregoing directions, with costs to the plaintiffs.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

ENOCH PIPER *vs.* JAMES BROWN *et al.*

[*In Equity.—Before Shepley, Judge.—Decision January* 21, 1873.]

PATENT OF ENOCH PIPER—PROCESS OF PRESERVING FISH—INFRINGEMENT—DAMAGES—CONFIRMING MASTER'S REPORT—PLEADINGS AND PRACTICE.

Where a large quantity of fish is preserved by a patented process the enhanced price obtained for the fish that are left in consequence of withdrawing the others from the market, is an incident of trade too remote and indirect to be charged against the owner as profits he has made by infringing the patent.

The loss incurred during one season in carrying on the business wherein the infringement consists is not to be deducted from the profits made during another season, if there is no connection between the business of one season and that of the other, and the accounts of each are kept distinct.

No deduction from the profits the respondents have made by infringing a patent are to be allowed on account of their time and services, nor any commission on their sales when they have paid none.

The master having found that the defendants could not preserve fish in their apparatus as constructed without using the complainant's process, they thereupon altered their apparatus in that particular; but on their refusing to permit the master to inspect the chamber where they preserved fish afterward, he found them guilty of then infringing the process, and his report was confirmed.

The master's finding as to the construction of apparatus will not be set aside for error in fact, if it is founded on personal inspection made with the consent of parties, as well as upon the evidence of others, which is not all of it reported.

It is not competent for the master to receive further evidence after the draft of his report upon a hearing has been submitted to the counsel.

Hearing on exceptions to the report of E. F. Hodges, Esq., Master in Chancery, awarding $11,426.76 profits by infringement of the complainant's patent of March 19, 1861, for improved process of freezing and preserving fish, &c.

The following facts appeared in addition to those stated in the opinion of the Court:

After the draft of the master's first report had been submitted the counsel of the parties, the defendants' counsel addressed to him a petition for leave to introduce further evidence, but the master refused such leave, deciding that after such submission of the draft report to counsel it was not competent for him to hear further evidence.

The respondents' infringing business was one occupying but a portion of each year. At the close of each season the accounts were closed, and at no time did the business of one year run into or connect itself with that of another. Under these circumstances the master reported disallowing the claim of the defendants to deduct the amount of a loss alleged to have been suffered in the business of 1869 from the profits made in the other years.

[*Brown & Holmes*, for complainant.
R. B. Curtis and *Avery & Hobbs*, for respondents.]

SHEPLEY, *J.*:

Exceptions were duly taken to the report of the master in this case by both complainant and respondents. Complainant excepts that the master finds as a fact that the respondents, by preserving fish by the patented process and withdrawing them from the market during the season of abundance, have been enabled to demand and have received a large price for their green unpreserved fish remaining in their hands for sale in the market; that they have received for such green fish one and one-half cents per pound more than they would have done had they not withdrawn from the market the preserved salmon; and that the amount of green fish on which such advanced price was received was 413,612½ pounds, making a total profit of $6,204.19, and he claims that the master erred in disallowing the item of $6,204.19 profits resulting from the enhanced price of green fish.

The master finds that the gain and profits to the respondents resulting from said enhanced price of one and one-half cents per pound on the sales of green fish in the said year, is not gain or profit with which respondents are to be here charged, because it is an incident of trade too remote and indirect to be charged in this account.

Where profits are recoverable by the owner of a patented invention against an infringer, they are such profits or gains as result directly or immediately from the wrongful act of the infringer. Remote and contingent profits or gains, depending upon the result of successive schemes or investments, are never allowed. The resultant profits are ordinarily best arrived at by determining the difference between the actual ascertained cost and the actual ascertainable value to the infringer, which value, in case of sales by him, is the price obtained or the market value of the thing sold. Profits contingent upon future bargains or speculations, or future states of the market, are not estimated and are not recoverable. The distinction between such profits as are direct and immediate and those which are remote and contingent is recognized in *Masterton* vs. *Mayor of Brooklyn*, 7 Hill, 61, and *The Philadelphia, W. and B. Railroad* vs. *Howard*, 13 Howard, 307.

The second exception of the complainant is to the finding of a fact by the master.

The master found as a fact that, by the alterations made during the season of 1870 in defendants' apparatus, the atmosphere of the preserving-chamber mingled with the atmosphere of the chamber containing the freezing-mixture, making practically one atmosphere. The whole evidence upon which the master based this finding is not reported. In fact, the report leaves it to inferred that upon this question, in addition to the light afforded by the evidence of experts introduced by the defendants, the master was aided by the evidence of his own examination of the premises at Charlestown, at an inspection of them made by him in the presence and by consent of the parties. Under such circumstances the finding of the master on a question of fact will not be reversed. (*Sparhawk et ux.* vs. *Wells*, 7 Gray, 423; *Boston Iron Company* vs. *King*, 2 Cush., 405; *Adams* vs. *Brown*, 7 Cush., 242.)

Respondents except to the master's report as to his findings in respect to the operations of the year 1870. The respondents having been enjoined by the Court from the use of their Charlestown apparatus as used by them in 1866 and 1867, continued during the years 1868 and 1869 to preserve fish by the plaintiff's process in a similar apparatus situated in Cambridge, and belonging to other parties. Such use of the Cambridge apparatus having been also adjudged an infringement, they returned, in the year 1870, to the use of the building in Charlestown. The master finds that the apparatus at Charlestown was originally so constructed that its use by them for the purpose of freezing and preserving fish was an infringement of the complainant's patent. They attempted to satisfy the master, and did satisfy him, that at some time between the 20th of June and the 3d of December, 1870, they so altered their apparatus that it could be used without infringing complainant's patent. Whether it was so altered before December 3, 1870, they did not prove. The finding of the master that the use of the apparatus so altered would not infringe the complainant's patent was certainly as favorable for the respondents as the evidence would justify. The expert who testified upon the subject did not believe that it made any practical difference in the process whether the openings between the two chambers were large or small. He rejects the whole theory upon which complainant applied for his patent, and utterly ignores any utility in the process of the plaintiff, so far as it is distinguishable from other known processes and patented to him. From his point of view, the communication between the atmosphere of the two chambers being productive of no change whatever, being entirely immaterial, (except during the time of replenishing the chamber containing the freezing-mixture,) the smallest orifice between the two would have been as available to take the apparatus out from the pale of infringement as the largest, and this he frankly states, in substance, in his testimony. Respondents could not reasonably object that a finding was not sufficiently favorable to them based upon this evidence. In coming to this conclusion the master was unquestionably aided, if not governed, by the evidence of his own senses when he made the personal inspection. But at Charlestown he did not witness the process. He only saw a part of the apparatus not in use. Respondents contend that the master having found that the alterations made at some time prior to December 3 were such that the use of the altered apparatus to preserve fish would not infringe the patent, the burden of proof was then upon the complainant to show that the apparatus when used was restored to its former state. The answer to this position is that the master has never found any change in the *process* or in the apparatus in use. Respondents exhibited to the master such portions of the apparatus as were not in use, but neglected, and on request refused, to exhibit the chamber in which the fish of the catch of 1870 was being preserved. The patent is for a process, not for an apparatus. The exhibition of the modified apparatus not in use was of little moment compared to the exhibition of that part of the apparatus in which the process was going on. This apparatus, or this portion of the apparatus in which defendants preserved salmon in Charlestown in 1870, was never shown to the master to have contained the alterations in the summer of 1870, at the time the freezing and preserving were in process.

No commissions were paid by defendants for selling the fish preserved by them. It is not customary in estimating profits from an infringement to allow the infringing parties compensation for their own time and labor. The master's decision rejecting the allowance of commissions is sustained. His report is also sustained upon the other points to which exceptions are taken, for the reasons stated by him in his report.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 12, 1873.

23,097.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 12, 1873.

23,165.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 12, 1873.

23,169.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON R. PETTER, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 29, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,386.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PUTNAM and WILLIAM C. BOOBE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859. Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 19, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMONY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,824, 4,825, and 4,826, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,963, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 3,829, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH R. STANWOOD, April 26, 1859. Hearing April 9, 1873.

22,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MENEMON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,830.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,836.—*Slate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,889.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,979.—*Rivets.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,023.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,093.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

EXTENSIONS GRANTED.

22,869.—*Improvement in Bakers' Ovens*, granted to GEORGE C. JENNISON, February 1, 1859; reissued March 5, 1872, numbered 4,783.

Claim.—1. Arranging the heating-chamber directly under the cooking-chamber and in direct communication with it, in combination with a carrier adapted to change the position in the cooking-chamber of the bread or other material to be cooked.

2. The arrangement of the cooking-chamber with respect to the furnace and its discharge-flues, substantially as herein described, and as represented in the drawing, whereby the advantage of the ascending power of the heat is availed of, while the smoke or principal portion thereof is carried off by the flues.

3. The arrangement of the charging and discharging orifices of the baking-chamber with reference to it and the lower smoke-eduction passage leading into the discharge-flue of the oven.

4. The combination and arrangement of one or more openings, *i i*, and the damper or dampers *k*, or equivalent, with the baking-chamber and its furnace and flues, arranged as specified.

22,885.—*Improvement in Harvesters*, granted to WILLIAM K. MILLER, February 8, 1859; reissued June 5, 1866, numbered 2,266.

Claim.—1. A frame composed essentially of a coupling or drag bar and a brace, which are hinged to the main frame at two points and connected in the line of the hinges, and furnished with lugs by which they may be united to the shoe at two points, substantially as described.

2. In connection with a yielding coupling-arm and brace, an intermediate lug bolted to said arm and projecting therefrom at such points as to make it capable of being united to a lug placed at the heel of the shoe, substantially as described.

22,885.—*Improvement in Harvesters*, granted to WILLIAM K. MILLER, February 8, 1859; reissued June 5, 1866, numbered 2,267.

Claim.—1. The short finger-beam hinged to the coupling-arm or brace, so that said finger-beam may be raised up and folded to the rear in line with the driving-wheels, substantially as and for the purpose described.

2. So constructing and arranging the hinged or pivoted point, on which the finger-beam is thus folded backward, as that the outer or free end of said finger-beam in its folded position may conform to the inequalities of the ground over which it is drawn, and independent of the vertical movement of the machine, substantially as described.

22,885.—*Improvement in Harvesters*, granted to WILLIAM K. MILLER, February 8, 1859; reissued June 5, 1866, numbered 2,268.

Claim.—1. A draw or coupling-bar hinged to the main frame, in combination with an adjustable hinge-piece and one or more setting or tightening bolts, substantially as described.

2. A yielding coupling-arm, made of two or more pieces or parts, in combination with a pivot and tightening-bolts for adapting one part to the other part thereof, substantially as described.

3. Making the hinge-piece adjustable for the purpose of raising or lowering the points of the fingers or guards, substantially as described.

22,885.—*Improvement in Harvesters*, granted to WILLIAM K. MILLER, February 8, 1859; reissued June 5, 1866, numbered 2,269.

Claim.—The combination of a supporting-shoe hinged by its lugs to corresponding lugs on an adjustable hinge-piece, which latter is, in turn, hinged or pivoted to the yielding connection by which the progressive movement of the finger-beam is controlled, substantially as described.

22,885.—*Improvement in Harvesters*, granted to WILLIAM K. MILLER, February 8, 1859; reissued June 5, 1866, numbered 2,270.

Claim.—So constructing and arranging the cutting apparatus of a harvesting-machine and its connections with the main frame, as that it may be converted from a front to a rear cutting-machine by transposing said parts, without taking from or adding to the machine any other parts or pieces than those which constitute the cutting apparatus in either of its positions, substantially as described.

22,890.—*Improved Carpet-Sweeper*, granted to N. B. PRATT, February 8, 1859.

Claim.—The arrangement of the bearings of the friction driving-rollers *e e* in the oblong slots *g g* of the box A, and the rollers *d' d'* in the specified relation to the ends of the revolving broom or brush, substantially as and for the purposes set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 28, 1873.]

6,368.—*Monument.*—WILLIAM T. CROSS, Kewanee, Ill.

6,369.—*Stove.*—CONRAD HARRIS and EDWARD KUMMER, Cincinnati, Ohio, assignors to C. HARRIS & SON, same place.

6,370.—*Stove.*—CONRAD HARRIS and EDWARD KUMMER, Cincinnati, Ohio, assignors to C. HARRIS & SON, same place.

6,371.—*Stove.*—CONRAD HARRIS and EDWARD KUMMER, Cincinnati, Ohio, assignors to C. HARRIS & SON, same place.

6,372.—*Stove.*—CONRAD HARRIS and EDWARD KUMMER, Cincinnati, Ohio, assignors to C. HARRIS & SON, same place.

6,373.—*Iron Fence.*—MARTIN KRUMM, Columbus, Ohio.

6,374.—*Governor-Base.*—W. BARNET LE VAN, Philadelphia, Pa.

6,375.—*Sewing-Machine.*—GEORGE RENFUSS, Philadelphia, Pa., assignor to AMERICAN BUTTON-HOLE AND OVERSEAMING SEWING-MACHINE COMPANY, same place.

6,376.—*Handle of a Kettle-Cover.*—ROBERT B. WARDIN, Philadelphia, Pa.

6,377.—*Cooking-Stove.*—HENRY A. WOOD, Bangor, Me.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date January 28, 1873.]

1,107.—*Writing-Paper.*—ABEL BEACH, Iowa City, Iowa.

1,108.—*Pruning-Shears.*—CHESTY & HUGHES, Clyde, Ohio.

1,109.—*Cigars.*—F. DE BARY & CO., New York, N. Y.

1,110.—*Spoons, Forks, &c.*—HALL, ELTON & CO., Wallingford, Conn.

1,111.—*Cigars.*—S. JACOBY & CO., New York, N. Y.

1,112.—*Bitters.*—WILLIAM H. KNOEPFEL, New York, N. Y.

1,113.—(Suspended.)

1,114.—*Corsets.*—THOMAS, LANGDON & CO., New York, N. Y.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date January 28, 1873.]

ORIGINAL PATENTS.

135,193.—*Car-Starter.*—PETER BATES, Jr., Pittsburg, Pa.

Sliding draft-beams are provided at each end of the car, and to each beam are connected two levers, which are pivoted to levers attached to the farther axle. To these levers are pivoted pawls, which engage with a ratchet which is secured to the axle. By this arrangement the amount of power to be applied in starting a car is diminished.

Claim.—The combination and arrangement of the axles B, ratchet-wheels C, pawls D, levers *g* A, rods *e f*, springs *d*, and draft-beams *m n*, all constructed, arranged, and operating with relation to each other, as hereinbefore described, and for the purpose set forth.

135,194.—*Sewing-Machine.*—ALBERT BINGHAM, Newtonville, assignor to FREDERICK CURTIS, Boston, Mass.

The pressure of the shuttle against the wall is regulated by the latch *f*. The presser being hinged directly opposite the needle, constantly bears on the cloth around the needle, and it adapts itself to seams.

Claim.—1. The combination of the vibrating shuttle-box carrier, the shuttle-box hinged to said carrier, and the spring-latch for holding said carrier with a yielding pressure against the wall I during the vibrations of the carrier, substantially as and for the purposes set forth.

2. The herein-described combination of the vibrator K, shuttle-box *d*, turn-button *f*, shuttle *g*, bobbin *i*, and screw *k*, when constructed and operating as described.

3. In combination with the vibratory shuttle-carrier and shuttle-box and the feeding mechanism arranged on opposite side of the wall I, as shown and described, the divided sewing-plate, the one part covering and surrounding the shuttle and its operating mechanism, the other part covering the feeding mechanism, and both parts hinged separately and independently to the machine, as and for the purpose set forth.

4. The combination of a curved presser-foot hinged to its operating-bar, so that its point of oscillation shall be in a vertical plane passing through the needle at right angles with the line of feed, and a convex-surfaced and vibratory feed having its point of oscillation in the same vertical plane with that of the presser-foot, said parts being constructed and arranged to operate with each other and the needle, as shown and set forth.

5. In combination with the screw *y*, or its equivalent, attached to the frame of the machine and operating to regulate the feed, as described, the feed yoke or frame provided, upon that side with which the feed-cam is in contact when retracting the feed-plate, with a yielding face, which, after the cam has retracted the feed to the extent permitted by the regulating-screw will yield and thus allow the cam to pass it and complete its rotation, substantially as shown and described.

6. The combination, with the vibratory shuttle-box and the shuttle and bobbin, constructed and arranged to operate in connection with the wall I as specified, of the means, substantially as herein shown and described, for clamping said bobbin with a greater or less pressure against the wall in rear of the needle, for the purposes set forth.

135,195.—*Dumping-Wagon.*—PEARCE BODLEY, St. Louis, Mo.

Angular metallic frames connect the bolsters, and the body turns on an axle journaled in this frame. The end-board is held independent of the body by means of braces secured to the connecting-frames.

Claim.—The rear supporting-arms E E', tail-board F, catch G, angle-brace D, connecting-shaft *d*, main supports C C', tilting-shaft C², when arranged to operate in combination with a wagon-bed, A, and wheels B B', as and for the purpose set forth.

135,196.—*Machine for Making Bungs.*—REINHOLD BOEKLEN, Brooklyn, N. Y.

In connection with a series of rotating holders for the material is an oscillating cutter.

Claim.—1. The devices, herein shown and described, for feeding, for shaping, and for cutting off the bungs, when constructed and operated substantially as and for the purpose herein stated.

2. The combination of the sleeve L, with the slides K K, springs M, and arbor B, substantially as herein set forth.

3. The combination of the sleeve Q, the pawls E K with the secondary sleeve S, when operating substantially as and for the purpose herein described.

135,197.—*Revolving Bullet-Mold.*—JOHN BRADFORD, Chicago, Ill., assignor to CHICAGO SHOT-TOWER COMPANY.

Two revolving rings provided with corresponding molds or half-molds on their inner faces, and capable of being warped or sprung apart at the proper point by means of a separator to allow of the balls dropping out.

Claim.—1. The combination of two rings provided with molds and capable of being warped, arranged relatively and operating substantially as described.

2. The combination of two rings capable of being warped and provided with molds, with a clamp and a separator, all substantially as specified.

3. In combination the following parts or elements of a machine—viz., first, two rings provided with molds and capable of being warped; second, a clamp; third, a separator; and, fourth, a crown-plate capable of revolution; all these parts being combined and capable of operating substantially as hereinbefore set forth.

135,198.—*Steam Vacuum Pump.*—WILLIAM BURDON, Brooklyn, N. Y.—Y'.

A vacuum is formed in the vessel and water is forced up into it by atmospheric pressure. Should the water acquire a momentum the vessel will be lifted up to permit the water to escape till the momentum be entirely exhausted. On the filling of the vessel, the steam-valve is shifted to admit steam to it, whereby the vacuum is destroyed and the water discharged.

Claim.—1. The combination of the rising and falling vacuum-vessel A, having an enlarged lower portion, the discharge-box D, constituting the bottom thereof, and the central guide-stem B, forming both a steam-inlet and a condensing device, the whole operating substantially as and for the purpose set forth.

2. The combination, with the vessel A and stem B, of a water-cup, *c*, essentially as and for the purpose specified.

135,199.—*Steam Vacuum-Pump.*—WILLIAM BURDON, Brooklyn, N. Y.—Q'.

The velocity of revolution should be so regulated as to give each chamber just time to fill and discharge.

Claim.—The combination, with the three or more vacuum-chambers, of a valve common to all, and so actuated by a steam-engine or other motor as to give steam to and shut it off from the several chambers in succession, substantially as herein described.

135,200.—*Steam Vacuum-Pump.*—WILLIAM BURDON, Brooklyn, N. Y.—P'.

Claim.—1. The combination, with one or more vacuum-cylinders, A A', of a hollow base or water chest, of larger horizontal area than the said vessel or vessels, having a partition, *a*, and a system of inlet-valves, D D, substantially as herein described.

2. The combination, with one or more vacuum cylinders or vessels, A A', and a hollow base or water-box having larger horizontal area, of discharge-valves E E, arranged around the said cylinders or vessels in the top of said base or chest, substantially as and for the purpose herein specified.

3. The combination, with the hollow base or water-chest, of the side discharge-openings *m m* and valves *n n*, arranged to open at their upper edges, substantially as and for the purpose set forth.

4. The hollow base or water-chest, constructed with upper and lower compartments and with upper and lower valve-seats, in combination with the vacuum-chambers and suction-pipe, substantially as herein described.

5. The combination, with the water-chest and its discharge-valves E and *n*, of the curb G, arranged as herein described and shown, for keeping the upper part of the water-chest covered with the discharge-water and the valves submerged.

135,201.—*Steam Vacuum-Pump.*—WILLIAM BURDON, Brooklyn, N. Y.—Z'.

Claim.—A steam-engine, a steam vacuum-pump, and a water-wheel so combined that the exhaust steam from the engine is used to operate the pump, and the latter is made to supply the water-wheel with water, whereby the exhaust steam is converted into an auxiliary to the engine, substantially as and for the purpose herein set forth.

135,202.—*Steam Vacuum-Pump.*—WILLIAM BURDON, Brooklyn, N. Y.—U'.

Claim.—1. In combination with the vacuum-vessel A of a steam vacuum-pump the removable bottom I, constituting a discharge-valve of an area equal to the entire area of the transverse section of the aforesaid vessel, substantially as and for the purpose set forth.

2. The combination, with the suction-pipe leading to the upper part of the vacuum-vessel, and with the vacuum-vessel itself, of the branch pipe *f*, essentially as and for the purpose set forth.

3. The combination, with the suction-pipe F, of the branch pipe *g*, furnished with an outwardly-opening valve, substantially as and for the purpose herein specified.

135,203.—*Steam Vacuum-Pump Operated by Exhaust Steam.*—WILLIAM BURDON, Brooklyn, N. Y.—N'.

The inlet-valves of the pump-chambers are connected directly with the valve-gear of a steam-engine and operated by the exhaust steam of the engine; or the exhaust steam enters the pump direct by pipes connected thereto and forces the water out. By this arrangement a condenser is made of the pump. Has, also, elevated condensing-vessels, perforated near their bottoms, for retaining water to effect the condensation of the steam in the chambers.

Claim.—1. The combination of an apparatus, such as is herein termed a steam vacuum-pump, with the exhaust-pipe of a steam-engine, whereby the said apparatus is made to serve the additional purpose of a condenser to the steam engine.

2. The combination of the steam-inlet valves of the steam vacuum-pump with the exhaust valve or valves of the steam-engine, substantially as herein described, whereby the said inlet and exhaust valves are worked by the same rod or valve-gear.

3. The condensing-vessel J, supported in the upper part of either chamber for the retention of a portion of the water, and perforated near its bottom for the discharge of said water to effect condensation, substantially as herein described.

4. The arrangement of the exhaust-steam valve or valves of the engine, substantially as herein described, to serve as the steam-inlet valves of the vacuum-pump.

5. The combination of two separate exhaust pipes of the engine with two separate vacuum-chambers, one pipe being connected with one chamber and the other with the other chamber, substantially as herein described.

135,204.—*Article of Food.*—GEORGE G. CAMPBELL, Oswego, N. Y.

Claim.—1. The process herein described of passing rye meal through a sieve of suitable fineness, for the purpose specified, and adding to it an equal quantity of Indian meal, the two being then thoroughly mixed for the purpose set forth.

2. A mixture of Indian meal and rye meal, substantially as described, placed in packages, and constituting a new article of manufacture.

135,205.—*Truck.*—JOHN CHISHOLM and ISAAC C. MAYER, Toronto, Canada.

Three trucks are so arranged as to operate in combination in moving buildings. Chains pass through the corners of the sills in such a manner that power being applied, the sills shall be more firmly bound together.

Claim.—1. The side trucks, composed, each, of the tapering wheels A A, axle B, body C, of a single timber, at right angles to the axle, and the strap-braces *a a*, constructed as described, and arranged, in combination with the front truck, substantially as herein specified.

2. The front truck, composed of the tapering wheels A A, axle B having the chain-hole *b* therein, and the bolster-block G, held upon the axle by the king-bolt *d*, constructed and arranged substantially as herein specified.

3. The brace-chains H I K K, arranged substantially as and for the purpose herein specified.

135,206.—*Waste-Trap for Wash-Basins.*—HUGH H. CRAIGIE, New York, N. Y.

The water passing out of the basin floats a ball-valve, which drops into its seat when the trap only is full. The escape of smell is thus prevented when, by evaporation or otherwise, the trap is empty.

Claim.—The valve *m* within the chamber *n*, in combination with the trap *d* and screw-ferrule *b*, substantially as and for the purposes set forth.

135,207.—*Rotary Engine.*—JAMES C. CULVER, Cleveland, Ohio, assignor of one-fourth of his right to JOSEPH G. PETTIE, same place.

The engine has a sliding abutment provided with a piston-head, a piston-valve for operating the revolving wheel, and piston by which the engine may be reversed or stopped.

Claim.—1. The piston-valve K with ports *k' k''*, in combination with the revolving wheel C and abutment E, arranged substantially as set forth.

2. The valve G with its ports, in combination with cylinder F, abutment E, and disk *f*, as and for the purposes herein described.

3. The double saw-tooth packing or its equivalent on the revolving wheel C, arranged as shown, and for the purpose set forth.

4. The combination of casing A, revolving wheel C, piston-valve K, abutment E, valve G, cylinder F, and disk *f*, all arranged substantially as and for the purpose set forth.

135,208.—*Safety Check for Horses.*—JOSEPH W. DOMETT, Boston, Mass.

The check-rein is constructed with a choke-strap and is secured to the carriage. The whiffletree is constructed so as to allow the horse to move forward a short distance without drawing the carriage. In this condition the horse, when standing, is prevented from starting, or, when running, is stopped.

Claim.—1. The arrangement of the check-rein *h* (with or without the hook *q*) and spring *g*, in combination with the whiffletree *a a* and spring and spindle *d e*, constructed substantially as and for the purposes herein before specified.

2. The combination and arrangement of the rein *h*, loop *k*, spring *g*, and choker *m*, substantially as and for the purposes above set forth.

3. The combination and arrangement of the whiffletree *a a*, rubber springs *c c*, spring *d*, and spindle *e*, as and for the purpose hereinbefore described.

135,209.—*Refrigerator.*—EDWARD S. EARLEY, Philadelphia, Pa.

To increase the cooling surfaces a flanged ice-box, having a winged central tube which extends nearly to the top of the ice-box, is suspended upon ledges within the refrigerator, so as to leave a space between the sides of the ice-box and the refrigerator. The walls forming the dead-air chamber are covered with paper and asphaltum varnish.

Claim.—1. The ice box or chamber having a central cold-air discharge, substantially as set forth.

2. The winged pipe E and opening D, in combination with the ice box or chamber B, substantially as set forth.

3. The combination, with the body A, of the ice-box having a central discharge, D, and a side space or spaces, C, for cold air, substantially as stated.

4. The opposite inner faces of the double walls with linings of paper coated with varnish, substantially as and for the purpose set forth.

135,210.—*Corpse-Cooler.*—EDWARD S. EARLEY, Philadelphia, Pa.

By means of the winged central pipe of the ice box and the manner of its suspension, greater cooling surface is obtained. The walls of the dead-air space are lined and coated to ensure an equable temperature.

Claim.—1. The winged pipe E and opening D, in connection with the ice-box B of a corpse-preserver, substantially in the manner and for the purpose set forth.

2. In combination with the body A, the ice-box with an opening, D, and winged pipe E, and the side spaces C, substantially as and for the purpose set forth.

3. The opposite inner faces of the double walls with linings of paper coated with varnish, substantially as and for the purpose set forth.

135,211.—*Washing-Machine.*—BUTLER EDGAR, Espy, Pa.

Between the lower rolls are introduced perforated slats or divisions secured to the ribs or frame to prevent the clothing from passing between the rolls and to allow the water to pass off. Combined with the frames are springs and cross-bar, the journals of which pass through the ribs, and the shoulders resting against the inside of the frame to hold them in place.

Claim.—1. The slats K K, the saddle bar L, and the frames or ribs H and H', as constructed and for the purpose specified.

2. The main roller C, the small rollers G' G'', as constructed, acting upon each other, as specified, in combination with the slats K K with the saddle-bar L, the concave frames or ribs H H', the metal sliding-boxes E E, the rubber springs E'' E'', the metal staples or stirrups F F, the thumb-screws *f'' f''*, and rubber cushions or springs *h'' h''*, embodying the construction of a machine, whose action shall be uniform and vertical, however the power may be applied, as and for the purpose specified.

135,212.—*Railway-Car Brake.*—JAMES F. ELDER, Blairsville, Pa.

The brake-levers are pivoted to extensible fulcrum-posts, which are pivoted to the outside faces of the bolster. The fulcrum-post is provided with a ratchet and pawl, that the brake-rubber, when worn, may be readjusted.

Claim.—1. The brake levers *d d'* pivoted to the opposite outer faces of the bolster, operating the brake-bars by their lower ends, and being connected at their upper or opposite ends by the brake-chain *h*, substantially as set forth.

2. An extensible fulcrum-post consisting of two parts, one sliding on or in the other, the parts being held in the proper relative position when extended by means of a ratchet and pawl, substantially as and for the purposes set forth.

135,213.—*Alarm and Lubricating Device for Car-Axle Boxes.*—OLIVER EVANS, St. Paul, Minn.

The shaft is secured by fusible plug, thereby raising a rod which closes the oil-reservoir. The chamber contains an explosive cartridge. An arbor carries an indicator or finger on the outside of the box. The heating of the bearing melts the plug, thereby relieving a shaft, which is raised, and the hammer is forced against the tube which contains the cap, and the cartridge is exploded and the indicator turned. A rod is lowered, allowing oil from the reservoir to flow to the journal.

Claim.—In combination with a journal and its box, a fusible pin or plug, so connected with the signal that the fusing of the pin or plug will cause the signal to be seen or heard, substantially as set forth.

135,214.—*Tanning Hides.*—ADOLPH FLEISCHHAUER, Brooklyn, N. Y.

Sulphur, lime, carbonate of ammonia, soda, sulphate of zinc, potash, terra japonica, sumach, muriatic acid, nitric acid, and salt.

Claim.—The process of tanning hides by the formulas numbered first, second, third, fourth, using the chemicals in the combinations, and the combinations in the order of succession, hereinbefore described, substantially as and for the purpose specified.

135,215.—*Door-Button.*—OTTO F. FOGELSTRAND, Kensington, Conn.

The face-plate of the button is provided with a projecting shell, which serves as a guide and support to the button, which has a depression corresponding to its rounded upper end. Around the base of this projection is a small ring which is furnished with four spurs. Upon the under side of the button are four recesses corresponding to the spurs. About the rivet, which secures the button to the plate is a coiled spring which draws the two together and thus secures the button from turning unless force enough is applied to counteract the force of the spring and separate the two sufficiently for the spurs to pass out of the recesses above them. The button can, therefore, be partially secured in four different positions corresponding to the spurs and depressions.

Claim.—The combination of the base-plate A bearing the shell *c*, having the raised points *c²* around its foot, the button C having the shell *c* overlying the shell *c*, with notches at its base corresponding to the points *c²*, the rivet *d*, the flange *e*, and the spring *i*, the whole constructed, arranged, and designed to operate substantially as described, for the purpose set forth.

135,216.—*Wood Sawing Machine.*—SAMUEL FUNCK, Quincy, Ill.

The saw is strained in a reciprocating frame and suspended by cords, the excessive friction being obviated by placing the frame upon rollers.

Claim.—The saw-frame B, consisting of two vertical and one horizontal pieces, provided with the guide-rods H, rollers I, vertical slide-beds G, and pivot K, in combination with the pitman L, wheel N, axle O, and gear-wheels P and R, when arranged and operated substantially as shown and described.

135,217.—*Sash-Lock.*—CHARLES T. GIBSON, Baltimore, Md.

A bell-crank lever is used to convey motion from the lifting-knob to the sliding bolt. The lifting-knob is itself pivoted to the rear of the case at a point back of the bell-crank, so that the shorter arm of the angular lever rests with a sliding contact upon the top of the lifting-lever forward of the fulcrum of said lever, and at the same time the large arm of the pushing-lever passes centrally down through an oblong slot in the bolt and bears with a sliding contact against said bolt with a force directly in line with its movement.

Claim.—The combination of the lever-button or lever-knob *g g'*, the angular pushing-lever C, its short arm *c'*, bearing with a sliding contact upon the lifting-lever forward of the fulcrum thereof, and the spring sliding bolt B *b*, the whole being constructed and applied to the sash-plate A, substantially as and for the purpose described.

135,218.—*Gear-Cutting Machine.*—JOHN JAMES GREENOUGH, Syracuse, N. Y.

The mandrel has an index-wheel keyed to it and a worm-wheel turning loosely upon it, which is operated by a tangent-screw having its bearings in the frame which holds the mandrel. The ends of the frame are bent up at right angles to form bearings for the centers between which it revolves. The axis of the mandrel is at right angles to the axes of the centers. The teeth are formed by turning the index-wheel and fastening it to the worm-wheel. The shape of the tooth is formed by turning the tangent-screw a certain distance while the cutting-tool is being fed up.

Claim.—1. The combination of the index-wheel *c* and mandrel *m* with the forming-wheel *d*, moved by a tangent-screw, *f*, or its equivalent, substantially as and for the purposes herein set forth.

2. The combination of the mandrel *m* with the cutting-tool having a movement on the centers *b*, and governed by an index and forming movement, substantially as and for the purposes specified.

3. The tool-block *w w'* and frame *z*, in combination with mandrel *m*, by which I cut radial teeth on a globular surface, as described.

135,219.—*Steam-Generator.*—THEOPHILE HARANG, Bayou Grove Plantation, Parish of La Fourche, La.

Two conical-shaped flues, larger in diameter at their rear ends, act as sediment collectors, and have the steam-space in a separate vessel connected to the said tapering flues by side-pipes, by which a circulation in the boiler is continually kept up.

Claim.—A steam generator or boiler consisting of the conical vessels A and B, walls D, E, F, and G, and cylinder C, arranged in the form of a saddle, substantially as and for the purpose herein before set forth.

135,220.—*Duplex Safety-Valve.*—THEOPHILE HARANG, Bayou Grove Plantation, Parish of La Fourche, La.

A safety-valve, with two exit-ports, has two valves, each having a spring, one stronger than the other, for the gradual exit of steam from the boiler.

Claim.—The safety-valve B, constructed and arranged to operate substantially as described, and for the purpose herein before set forth.

135,221.—*Sash-Balance.*—BENJAMIN F. HARTMAN, Pickering Post, Charlestown Village, Pa.

A casing, provided with a toothed rack, is attached to the lower sash, into which works a pivoted bar provided with a tooth or detent fitting into the rack. There is also a spool secured upon a shaft, by means of which the available length of the connecting cords or tapes is adjusted.

Claim.—The means employed for adjusting the available length of the connecting cords or tapes, consisting of the casing K provided with the toothed rack O, the spool L secured upon the shaft *l* and provided with the partition-disk *l'*, the loosely-pivoted bar M provided with the tooth or projection *m'*, and knob N, and the spring *z*, when said parts are constructed and combined substantially as specified.

135,222.—*Filter.*—PROSPER HUBERE, San Francisco, Cal.

Two hollow semi-globes are screwed together to form a single hollow sphere, and have short tubes projecting from opposite sides. Inside of the hollow globe is a filtering-stone similar in shape to the globe, and having a hole passing from the center to one of the projecting tubes.

Claim.—The reversible hollow globe or oblong filtering-vessel A A, with its short tubes C C' and cleaning-faucet E, in combination with the round or circular filtering stone B, having a hole passing to its center and communicating with one of the tubes C C', substantially as and for the purpose above described.

135,223.—*Compound Steam-Engine.*—LAFAYETTE HUNTOON, Natick, Mass., assignor to himself and EDWIN C. HUNTOON, same place.

The exhaust steam of the expansion-cylinder is conducted into the rear of the piston of the high-pressure cylinder to equilibrate the pressure therein, while the exhaust steam from said high pressure cylinder is driving the piston of the expansion or low-pressure cylinder. Has only one valve, with a passage for both cylinders.

Claim.—1. In a double cylinder steam-engine operating with a single valve, substantially as specified, the mode herein described of equilibrating the pressure upon the piston of the small or primary cylinder, while the exhaust steam from said cylinder is driving the piston of the larger or second cylinder by bringing at that time that part of the first cylinder in rear of its piston in communication with that part of the said cylinder in front of said piston, and from which the exhaust steam is passing, substantially in the manner and by the means shown and set forth.

2. The valve J provided with a passage, *d*, and a chamber, *k*, substantially as described, in combination with the two cylinders and the ports *c*, *c'*, *f*, *f''*, and *g*, substantially as and for the purposes set forth.

135,224.—*Feed-Roll for Planing-Machines.*—STEPHEN INMAN, Rockford, Ill., assignor of one-half his right to HENRY P. STOCKTON, same place.

A series of elastic segments are secured upon a shaft by serrated washers placed between them, the segments being pressed together until the washers are wholly embedded.

Claim.—1. A flexible-faced feed-roller composed of a longitudinally-grooved shaft, A, toothed washers C, and sections or rings of rubber *b*, constructed, arranged, and secured together in the manner substantially as described.

2. The toothed washer C having the teeth *c* projecting on opposite sides as means of holding two adjacent rings of rubber together in the manner substantially as described.

3. The combination of the washers having tongues *c'*, staples *c''*, and wood plugs *d* with the shaft A of a feed-roller having groove *c''*, in the manner and for the purpose described.

4. The removable journal *a* having the collar A'' and screw-pin *e*, in combination with the tooth-washer C, rubber rings *b*, and shaft A, constructed and operating substantially as and for the purposes described.

135,225.—*Wash-Boiler Attachment.*—ROBERT JEFFERS and DAVID C. BOCKOVEN, South Sodus, N. Y.

A rim to insert in an ordinary wash boiler, has a floor near its upper part, and openings at the sides. Above the floor and through an opening in it is attached a vertical tube, on the upper end of which are two curved pipes with detachable perforated nozzles. Above the rim and floor are hinged perforated lids.

Claim.—The wash-boiler attachment, consisting of the floor A, perforated hinged disk B B with its supports, in combination with the central tube F, curved top E, nozzles D D, and lock *a*, constructed and arranged substantially as herein described and specified.

135,226.—*Apparatus for Making Ozone.*—CHARLES H. JOHNSON, New Brighton, Pa.

Claim.—1. The pan A and the jar B with tube *g*, and tube *e* with stop-cock *i*, and the combination of the boiler D with the atomiser C, (the boiler D containing water, and having heat applied for boiling,) and the combination of both the boiler D and the atomizer C with the jar B and pan A, for the rapid production of ozone from phosphorus placed under jar B, partly in water, by producing a rapid current of air through the jar B and an increase of temperature within the jar, both favoring the rapid production of ozone from the phosphorus.

2. The pan A and the jar B with tube *g*, and tube *e* having stop-cock *i*, and the bottle *j* containing an alkaline solution, and the combination of the boiler D with the atomiser C, (the boiler D containing water and having heat applied for boiling, and being connected with the atomiser C by the tube *l*) and the combination of both the boiler D and the atomiser C with the jar B, and with the bottle *j* containing an alkali in solution, for the purifying of ozone by bringing the alkali in a heated and atomized state into intimate contact with the ozone and acid gases passing upward from the phosphorus under jar B, eliminating the acid-gases by chemical action and leaving the ozone pure, in the manner hereinbefore fully set forth.

3. The jar B with tube *g*, and tube *e* with stop-cock *i*, the combination of the boiler D and atomiser C with each other and with the jar B, (the boiler D containing water and having heat applied for boiling, and being connected with the atomiser C by the tube *l*,) for expelling ozone formed from the phosphorus under jar B by producing a rapid current upward through the jar B, and outward through the tube *g*, by the means and in the manner hereinbefore fully set forth.

4. The construction of the apparatus as a whole, consisting of the pan A with its parallel bars *a a*, zinc plate *h*, curved tube *e* with stop-cock *i*, the jar B with horizontal tube *g*, and the atomiser C, bottle *j*, boiler D with tube *l*, the cross-bar *s* with thumb-screw over the jar B, all combined and arranged in the manner and for the purpose hereinbefore fully set forth.

135,227.—*Hot-Air Furnace.*—HORATIO N. LONGFELLOW, Lawrence, Mass.

An arrangement of flues and dampers to regulate the flow of the products of combustion, and to afford access for cleaning the interior of the furnace.

Claim.—1. The arrangement of the down-draft L, slides P and R, bed-plate A', and cover F, as and for the purposes hereinbefore described.

2. The arrangement of the pipes K, openings H, staves D D' D'', plate N, and down-draft L, as and for the purposes hereinbefore specified.

135,228.—*Security-Hook.*—JOHN K. MACDONALD, Newark, N. J.

A combined hook and pin has a spiral spring about its shank, which is fastened near its lower end and turned back to form a hook for the pin. The spring extends to the point where the hook terminates and is then bent over against it and downward in a line parallel with the shank, and terminates in a ring. The torsion of the spring secures any object to the hook.

Claim.—As a new article of manufacture, the security-pin constructed with the spring *d*, hook *e*, and rod and ring *f* attachment, substantially as and for the purposes specified.

135,229.—*Machine for Burnishing and Trimming the Edges of Boot and Shoe Soles.*—JAMES W. MALOY, Boston, assignor to BENJAMIN F. LARRABEE and SAMUEL H. HODGES, Lynn, Mass.

The jack is attached to an adjustable chuck, which is operated in connection with an eccentric cam, describing in its revolution the different curves of a boot or shoe. A similarly shaped cam (both attached to the same shaft) gives a corresponding movement to the tool-carrying frame.

Claim.—1. The combination of the shaft *l*, slotted arm *a*, eccentric *g*, chuck *e*, provided with cross-bars *p*, plates *e'*, and jack *a'*, all arranged and operating as and for the purpose specified.

2. The slide P having the nave N with a projection thereon and combined with the head I, having a recess to receive said projection, and combined also with the vibratory frame B, rotatory stem D, slotted bar O, and a rotary tool for cutting, trimming, burnishing, &c., all arranged as described.

3. The shaft *l* in combination with the cam *a'*, connecting-rod *y*, stem A, and vibratory frame B, all arranged as set forth.

4. The chuck *e* provided with the cross-bars *p* and combined with the plate *e'* and eccentric *g*, as explained.

5. The head-stock *d* provided with the ends *d' d''* and combined with the shaft *l*, spring *s*, and guide-way *c*, all arranged as and for the purpose specified.

135,230.—*Railroad-Chair.*—EUGENE D. MANN, Elyria, Ohio.

A self-acting clamp for compressing and confining the rail in its seat by the weight of the train.

Claim.—The clamps D E, constructed with the pivots *a* and clamping portions *m*, and forming the broad seat *d* for the rail, and the chair A B C and cushions *c c*, the several parts being combined and arranged substantially as and for the purpose herein set forth.

135,231.—*Tan-Vat.*—CHARLES H. MANNING, Washington, D. C.

The vat is adapted for tanning in vacuums and under pressure successively or separately.

Claim.—1. A tan-vat constructed of two or more thicknesses of wood or equivalent material, with an intermediate thickness of lead or equivalent metal, and one or more thicknesses of waterproof paper, substantially as and for the purpose herein specified.

2. A varnish or coating composed of bees wax and spirits of turpentine applied to the metallic and paper thicknesses of the tan-vat, for the purpose herein specified.

3. The groove or depression *h* in the top of the vat in combination with the cover A and its projecting packing-rim *i*, substantially as and for the purpose herein specified.

4. The packing gasket *l*, when applied to the rim *i* of the cover A, so as to project laterally beyond the edges thereof, for the purpose herein specified.

5. The hard soap or equivalent plastic substance applied in the groove *h* of the vat, in combination with the rim *i* of the vat-cover and the gasket *l* thereon, for the purpose herein specified.

6. The agitators E E connected together and arranged to vibrate vertically across the interior of the vat, in the manner as shown and described, and for the purpose herein specified.

135,232.—*Tan-Vat.*—CHARLES H. MANKINS, Washington, D. C.

Claim.—A tan-vat made of cast-iron lined inside with wood and with a layer or thickness of pitch, tar, asphaltum, or their equivalent between the iron and wood, substantially as and for the purposes herein specified.

135,233.—*Safety Gun-Lock.*—DILLON H. MAPOTHER, Louisville, Ky.

The hammer is securely locked when set in any position, and can only be released by a simultaneous duplex or two-fold action of the operator upon the lever P and the slide N.

Claim.—1. The combination of the bridle I with its key-socket J, key K, and operating-arm L, and the tumbler H, with its notch and lug T T, when arranged, constructed, and operated substantially as and for the purpose set forth.

2. The devices in the former claim, in connection with the thumb-slide N and lever P, with its spring Q, bolt S, and knob R, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

135,234.—*Spittoon.*—EMMETT MATHER, Chicago, Ill., assignor to FRANK STURGES & CO., same place.

The spittoon, in the sides and top is composed of a disk of sheet metal struck up, with a disk of sheet metal for the bottom.

Claim.—A new article of manufacture, consisting of a sheet-metal spittoon, the body and cover of which are made in one continuous piece attached to the bottom.

135,235.—*Back-Chain for Cart-Saddles.*—WILLIAM B. MCCLURE, Alexandria, Va., assignor to himself, H. O. CLAUGHTON, and JOHN C. GRAHAM, same place.

The links of a cart-chain are supplied with rollers and swivels, and adapted to operate over a cart-saddle.

Claim.—1. The link A having the enlargement a^1 with central orifice, the roller a^2, and shaft a^3, as and for the purpose described.

2. The combination of the link A, constructed as described, with the intermediate link B having the curved interior and flat exterior surfaces, as described.

3. The combination of the central portion of the chain, composed of roller-links and connecting-links, constructed as described, with the bar-links C, substantially as and for the purpose set forth.

4. The combination of the central portion of the chain and the bar-links with the swivels at each end, as and for the purpose described.

5. The described chain, consisting of the central portion, bar-links, swivels and links, and traveler, as a new article of manufacture.

135,236.—*Steam-Generator.*—ALEXANDER R. MCDONALD, Chicago, Ill.

The tubes communicate with the water and steam space, and are closed by screw-caps at the other end.

Claim.—Boiler A, in combination with dome D, smoke-stack E, and fines B, the whole arranged to operate substantially in the manner and for the purposes herein set forth.

135,237.—*Clothes-Wringer.*—THOMAS E. MCDONALD, Trenton, N. J.

A wringing-machine constructed with pressure-bars and springs, whose ends rest in contact with springs in which are located the journals of the rolls, which work in grooves in the sides of the frame with flanged projections. The clamping bars are constructed with a projecting bolt, which passes through the two pieces which compose the sides of the frame, and are firmly held by a nut. The roll is formed with a slot through or nearly through its center, and is oval in form. The space or slot is filled with rubber, and the surface covered or wound with cord or wire, and the roll formed by rubber over the whole.

Claim.—1. The presser-bars A'' A^x, springs a'', screw *a*, in combination with journal-boxes *c''* in grooves A^4, substantially as and for the purpose described.

2. The clamping-arm B, when constructed and applied in the manner and for the purpose substantially as described.

3. The wringer-roll C, constructed upon the spindle or shaft E, having the open slot and wound with the cord or wire, in combination with the rubber *f* in the open slot, and the rubber forming the roller surface, substantially as described.

135,238.—*Bridling Loop-Buckle.*—JAMES H. MCGARRAH, Princeton, Ind., assignor to SETH WARD, same place.

The side bars are arched, forming loops, and a depending tongue is attached to the bridge connecting said arches.

Claim.—The breeching-loop, consisting of the frame D E F, with arched bows C C springing from the side bars to form the loops *s s*, and connected by the bridge A having a downward-projecting tongue, B, substantially as and for the purpose described.

135,239.—*Railroad-Car Heater.*—JOSEPH PORTER MICHAELS and LEWIS WALLS BROADWELL, Vienna, Austria, assignors to themselves and PHILIP SIDNEY POST, same place.

The exhaust steam and waste products of combustion from the locomotive are directed through pipes extending to the rear of the train, the heat being utilized to warm the cars. The automatic pipe-couplings are constructed to adapt themselves to the vibrating motion of the cars when under way.

Claim.—1. The combination of the bent escape-steam pipe B, the valve *b*, the smoke-box A, the valve *d*, and the pipe E.

2. The conical hollow buffer-coupling L L, composed of springs *k*, flexible covering *l*, and padded flanges *m*, for automatically making connection between the vehicles, essentially as described.

135,240.—*Traction-Locomotive.*—THOMAS S. MENNIS, Meadville, Pa., assignor of two-thirds his right to EVANS W. SHIPPEN, same place.

The endless track is so constructed that it will not bend inwardly, and extends around traction-wheels, which are arranged within a rocking-frame so that the endless track may better conform to the irregularity of the road-bed. Between the cog-wheels on the outside of the traction-wheel is a cog-wheel on the axle, which allows the traction-wheels to be thrown out of gear by means of a sliding sleeve upon the axle.

Claim.—1. The combination of an endless traversing-track, its supporting-wheels, and a frame rocking on a transverse axis, substantially as set forth, to enable the track to conform to undulations of surface.

2. The combination, with a traction-locomotive, of two endless traversing-tracks, arranged one in front of the other, and each rocking on an independent central transverse axis, substantially in the manner set forth, to allow either end of the machine independent conformity to the surface over which it passes.

3. The combination, in a traction-locomotive, of an endless track, wheels upon which it traverses, and spring-cogs to lock together the wheels and track, substantially as set forth.

4. The combination, in a traction-locomotive, of an endless traversing-track with driving-wheels constructed with both frictional surfaces and cog-gearing, substantially as set forth, to obtain increased driving-power and to prevent undue strain on the wheels by the track.

5. An endless traversing-track for traction-locomotives, constructed, substantially in the manner set forth, of articulated interlocking links *g g'*, flexible outwardly, to traverse the wheels, but rigid against inward thrusts, to secure a broad bearing-surface.

135,241.—*Stem Winding and Setting Watch.*—CHARLES ADOLPHE MONTANDON, Locle, Switzerland.

The setting mechanism is thrown into gear by means of a pin projecting through the center of the rim in such relation to the pendent ring that when the ring is turned down on either side it presses in the pin if the cap on the same side is open. A spring retracts the pin when the ring is turned up.

Claim.—1. The slide *a* projecting out through an opening in the center of the rim A and separate from but in such respect to the stem, as described, as to be operated upon, whichever case is open, by turning of the ring E, as herein shown and set forth.

2. In a stem winding and setting watch, the mode, substantially herein described, of operating the gear of the index-hands by a pin projecting through the center of the rim and actuated by the turning upon it of the pendent bow, whichever cap is open.

135,242.—*Lock-Nut.*—WILLIAM H. NICHOLS, East Hampton, Conn.

A nut is fitted on a square portion of the bolt, immediately below the threads. A second nut is screwed tight against the first, and a pin introduced between the nuts in corresponding grooves, made in the face of each, prevents their loosening.

Claim.—The dummy nut or washer held from turning upon the bolt by means of the shape of the orifice in the washer through which the bolt runs, and the real nut held from turning upon the washer by means of a pin or pins driven into a corresponding groove or grooves in the opposed faces of the nut and washer, the whole combined, constructed, and arranged to operate substantially as described, for the purpose set forth.

135,243.—*Machine for Pressing and Shaping Cigar-Fillers.*—CHARLES H. PALMER, New York, N. Y.

The bottom mold is divided longitudinally and provided with adjustable tip-cutting dies, one of the parts being pivoted. The "lever-knife," which carries the upper pressing and tip-cutting die, has a flattened hub to receive the action of a retaining-spring and a projection for disengaging a catch, which holds together the bottom mold.

Claim.—1. The combination, substantially as herein set forth, of a bottom mold for pressing and shaping cigar-fillers, and a movable or adjustable die or dies for cutting the tips.

2. A bottom mold for pressing and shaping cigar-fillers and cutting their tips, divided into two parts by a vertical plane passing longitudinally through between them.

3. A bottom mold for pressing and shaping cigar-fillers, divided into two parts by a vertical plane passing longitudinally through said mold, one or both parts being pivoted at one end and provided with adjustable tip-cutting dies.

4. A cigar-pressing, shaping, and tip-cutting lever-knife provided with a bearing or stud at one end, on which it may vibrate in the arc of a circle, a hub fitted to receive a retaining-spring and a lever projection to actuate a lever for disengaging the catch of the bottom mold.

5. The combination, substantially as herein set forth, of a bottom cigar-mold divided into two parts by a vertical plane passing longitudinally through said mold, provided with tip-cutting edges, and a lever-knife moving in the arc of a circle for pressing and shaping cigar-fillers, and provided with tip-cutting edges for cutting the tips of the same.

6. The combination, substantially as herein set forth, of a bottom cigar-mold divided into two parts, as hereinbefore described, a pressing, shaping, and tip-cutting lever-knife, a lever for disengaging the catch, and a catch for holding the parts of the mold together.

7. The combination, substantially as herein set forth of a cigar-shaping, pressing, and tip-cutting mold, a lever-knife provided with a bearing or stud, on which it may vibrate in the arc of a circle, a hub flattened to fit a retaining-spring, and a retaining-spring.

135,244.—*Wheel for Vehicles.*—NELSON PALMER, Athens, N. Y., assignor to DAVIS WHEEL AND PALMER FORK COMPANY, New York, N. Y.

Claim.—1. The spokes S S, held in their position at the center of the wheel by means of a single tube, C, on the axle-box and within the shell of the hub, and nut or nuts D, substantially as set forth.

2. A tube, C, passing through the center of a wheel within the shells G and G' on the axle-box, and receiving a clamping-plate, B', and nut D on one end, and a clamping-plate, B, with or without a nut on the other end, substantially as set forth.

3. In a vehicle-wheel, the combination of the axle-box A, tube C having clamping-plates B B', spokes S S, nuts D, E, and F, shells G G', lug L, spiral spring K, and recon-plate or nut N, all constructed and arranged substantially as set forth.

135,245.—*Brewing Beer and Ale.*—LOUIS PASTEUR, Paris, France.

The wort, prepared in the usual manner, while boiling hot is introduced into a closed tank and a current of carbonic-acid gas admitted, which drives out the air, after which water is sprayed over the tank to cool the contents.

Claim.—Subjecting the wort to a process for the expulsion of the air and cooling it off, substantially as and for the purposes set forth.

135,246.—*Metallic Shutter.*—WILLIAM HENRY RODDEN, Toronto, Canada.

The movable slats are operated by a tangent screw and wheel, H, connected with the vertical rod C. This mechanism also serves as an efficient lock to prevent turning the shutter slats from the outside.

Claim.—1. A shutter, composed of an angle iron or steel frame, A, eccentric movable metallic slats B B beat at the ends and pivoted there to the frame A on shouldered rivets, and wired at one edge to connect them with the upright or transverse working rod or bar C, substantially as herein specified.

2. In combination with the movable slats B B and working bar or rod C, the slat lock or fastener, composed of the screw G and worm-wheel H, with its crank-pin *g*, substantially as herein specified, and for the purpose set forth.

135,247.—*Truck.*—MARTIN L. SENDERLING, Jersey City, N. J.

A bent axle is provided, that the truck-frame may be carried lower? The frame has projections on its rear cross-bar, to prevent the cask from sliding, and the truck has chains, to which are attached cant-hooks, so arranged that the same may hold the cask securely.

Claim.—The combination of the cant-hooks H and one or more back-retainers, G, with the bent or cranked axle C, the shafts or runners B B, the main wheels D D, and the frame A, open in the rear of the truck, substantially as specified.

135,248.—*Attaching Hair-Spring to Watch-Balances.*—JACOB SHAW, Shelby, Ohio.

A small flanged sleeve, fitting tightly on the balance-staff, receives the inner end of the hair-spring around it, and the said hair-spring is held in place by a nut screwing down upon its coiled edge. This allows the sleeve and its attached spring to be adjusted upon the balance-staff, being held thereon simply by friction.

Claim.—The plate F and tube, and the nut G in combination with the spring D and the balance-staff E, substantially as shown and described, and for the purpose set forth.

135,249.—*Diamond-Gage.*—WARREN SHUMARD, Richmond, Ind.

The diamond, secured in the end of a graduated and adjustable rod, is operated by a swivel secured in a flexible-seated base.

Claim.—1. The base A having the elastic cushion C attached, substantially as described.

2. The rod H, as described, in combination with the swivel B and cap G and base A, as specified.

135,250.—*Tilting-Machine.*—GEORGE J. SMALE, Chicago, Ill.

The see-saw has seats which can be adjusted at different points on the bar for balancing different weights, and also can be placed so as to enable the person to sit astride the beam or sidewise.

Claim.—The seats C C, constructed substantially as described, and adjustably attached to the balancing-bar B, arranged upon a suitable support, substantially as and for the purposes specified.

135,251.—*Refrigerator.*—APOLOS B. SPENCER, Cleveland, Ohio.

The ice-box slides from side to side on rollers, and the waste water is conducted in a side trough to the waste-pipe.

Claim.—The box A, box B, false bottom E, the ice-box D, the three-part lid K, when the parts are constructed and arranged in relation to each other substantially as shown and described, and for the purpose set forth.

135,252.—*Process for Treating Lamp-Wick.*—ST. CLAIR F. SUTHERLAND, Baltimore, Md.

Claim.—Lamp-wicks prepared by the successive application thereto of asbestus and silicates of soda or potassa, as and for the purpose specified.

135,253.—*Picker for Looms.*—WILLIAM TAYLOR, Maynard, Mass., assignor of one-half his right to WILLIAM MAYNARD, same place.

A layer or layers of sheet metal incorporated with the layers of rawhide to strengthen the latter.

Claim.—1. A rawhide picker having its plug connected to its shank, as above described.

2. A rawhide picker having its spindle-sleeve connected to its shank, as above described.

135,254.—*School-Satchel.*—HENRY WALLS, St. Louis, Mo.

The satchel, constructed to swing on the back, contains a lunch-box above the book-box, and a receptacle for pens, pencils, and ink below.

Claim.—1. The arrangement of a metallic lunch-box, G, with a satchel, as herein shown and described, as and for the purpose set forth.

2. The bottom C of a satchel, hollowed or mortised, as herein shown and described, as and for the purpose set forth.

3. An improved school-satchel, consisting of lunch-box G, shoulder-straps E, outside rubber bands F, pen pencil-case C^1, inkstand C^2, lid H, turn-catches A^3, satchel-parts A, B, B^1, C, and D, all constructed to operate as and for the purpose set forth.

135,255.—*Car-Coupling.*—SAMUEL H. ZINK, Knoxmeater, Mo.

To a crank-shaft, which is attached to the top of the draw-head, is secured a pawl, which holds the link, the latter engaging with the opposite end of the other link when the draw-heads meet. The draw-heads are uncoupled by turning the crank, which raises the link to a level and releases the pawl.

Claim.—The combination of the draw-head A, tongue B with head *d*, shaft *a* with crank *b*, pawl C with crank *f*, and the spring D, all constructed and arranged substantially as and for the purposes herein set forth.

135,256.—*Machine for Sharpening Gin-Saws.*—JASPER M. BAILEY, Meridian, Miss.

Claim.—A file-holder, O, having a turned-up end, which is connected by link N with the crank M of a drive-wheel, as described, so as to give a reciprocating motion in the smallest space and without friction.

135,257.—*Vibrating Propeller for Vessels.*—DAVID BAINBRIDGE, Philadelphia, Pa.

A paddle-blade is directly connected to a bent or crank-shaft, whereby an oscillating and vibrating motion is imparted to the blade.

Claim.—The combination of the blade A and a shaft, D, to the central portion of the crank *b'* of which the blade is attached, as described.

135,258.—*Meat-Chopper.*—ISAAC BATTEY, Manchester, N. J.

By pawls and a shifting device the chopping-box is made to travel back and forth alternately. A double rack, having each set of teeth arranged alternately, causes the blade to strike in intermediate places at each movement of the box. The rectangular box is arranged to be turned horizontally, to give a cross-cut to the meat.

Claim.—1. The combination of the vertically-moving chopping-blade, horizontally-moving chopping box, double reversed ratchet-bar, pawl-slide, pawls, and pawl-shifting plate, the pawl-slide being operated by the crank-shaft, and the pawl-shifter being worked by the ratchet-bar, all substantially as specified.

2. The combination, with the vertically-moving chopping-blade, of a square horizontally-moving chopping box, arranged to turn horizontally to present the meat for cross chopping, substantially as specified.

3. The relative arrangement of the two sets of teeth of the ratchet bar to cause the blade to strike, in one movement of the box, between the cuts made during the reverse movement, substantially as specified.

135,259.—*Method of Burnishing Boot and Shoe Heels by Machinery.*—JOSHUA BRADLEY, Lynn, Mass., assignor to TAPLEY HEEL-BURNISHING-MACHINE ASSOCIATION, same place.

The burnisher either revolves entirely around the heel or the heel entirely around the burnisher.

Claim.—The mode herein specified of burnishing boot and shoe heels by machinery—that is to say, giving the burnishing-tool or the heel to be burnished, or both, such a vibratory movement that at each vibration of either or both the tool shall be caused to pass around the whole or nearly the whole curved portion of the heel while maintained in yielding-pressure contact therewith, substantially as described.

135,260.—*Molasses Jug or Pitcher.*—MARK J. BENNETT, Braddocks, Pa.

A molasses jug or pitcher has an extended or raised top within the cap, through which the syrup passes when in use. The drip from the top is covered by the cap, and by the shoulders in the extended top is conducted to the body of the pitcher.

Claim.—The formation of the glass or earthenware body of the jug or pitcher with a spout or mouth, a shoulder, and a notch or its equivalent, substantially as and for the purposes described.

135,261.—*Washing-Machine.*—SAMUEL BERRY, New York, N. Y.

A washing-machine constructed with its rubber on its under surface covered with brushes of bristles and the bottom of the tub with corrugations. To the rubber is attached an upright shaft, and on its upper end a double or cross handle by which motion is given to the rubber.

Claim.—The corrugated bottom B, combined with a circular brush, C, operated in a close box, A C, as and for the purpose described.

135,262.—*Car-Coupling Attachment.*—WILLIAM G. BROWN and JAMES W. JENKINS, Monmouth, Me.

Means for guiding the link. A bell has downwardly-projecting arms, which receive the link of the approaching car. The

ball itself guides the link of the draw-head to which it is attached, operated by means of a spring-shaft extending to each side of the car, through suitable connecting-arms.

Claim.—The combination of the ball E, provided with downwardly-inclined arms M, the side arms F, connecting-bars G, levers H, shafts I, arms J, springs K, and levers L with each other to adapt them to be connected with a car-coupling, substantially as herein shown and described, and for the purpose set forth.

135,263.—*Mechanical Movement.*—CHARLES W. CARR, Paola, Kans.

Reciprocating motion is imparted to the branched connecting-rod by means of the cam provided with tappets which strike the rod in their revolutions.

Claim.—The combination of a cam-wheel, B, with three, five, or more tappets or leaves, with a branched connecting-rod having two toes, E F, the tappets and toes being relatively arranged, substantially as specified.

135,264.—*Cultivator.*—AMOS B. COLVER and JOHN PRIEST, Albany, Oregon.

The cultivator-frame is raised both front and rear at the same time by means of lever L, link O, and lever D. The frame is held in its elevated position by the latches R.

Claim.—1. The combination, with the cultivator, the truck, and the caster, of the housings, the levers D L, standards F K N, the connecting-link O, the pins P, and the adjustable collar Q, substantially as specified.

2. The combination of the hooks R, rods T, and lever S with the truck and cultivator, substantially as specified.

135,265.—*Device for Feeding Stoves.*—BERNARD CONNELLY, Williamsburg, N. Y.

The cylindrical part of the scuttle is inserted in the hole in the top of the stove, and the locking-pin is withdrawn from the chain, which allows the hinged part of the bottom to drop into position.

Claim.—An improved coal-scuttle, formed of the body A made conical in its upper part, cylindrical in its lower part, and provided with an outwardly-projecting flange, *a'*, the cover B made in two parts, one stationary and the other hinged; the bottom C made in two parts, one stationary and inclined and the other hinged; and the chain D, said parts being constructed and operating in connection with each other, substantially as herein shown and described.

135,266.—*Leather-Cutting Machine.*—RICHARD CROCKER, Marshalltown, Iowa.

An adjustable frame, which may be detached from the knives and so supported that a portion of a wide piece of leather may project while the remainder is being cut.

Claim.—1. In a strap-cutting machine, the annular cutters C having their surfaces centrally serrated to prevent their turning on the shaft D, substantially as specified.

2. The yoke G secured to the standard E^1, and constructed with the depending plate E^2 supporting one end of the cutter-shaft D and the combs I, substantially as specified.

3. The grooved guiding-roller L, in combination with the adjustable frame N, the frame A, and the parallel rotating knives, substantially as specified.

135,267.—*Bottle-Stopper.*—DAVID M. CUMINGS, Newburyport, Mass.

The metallic center-pin of the stopper is provided with a flange, through holes in which the bent portion of a hinged yoke passes and is secured by the bent arm of a hinged lever, which is swung up and crowded over it. An elastic covering surrounds the entire stopper on all sides except the bottom.

Claim.—The combination, with an elastic stopper, of a flanged pin, C, a yoke, E, passing through the part *c* of said pin, a fastening-lever, H *e*, and rings F G, as shown and described.

135,268.—*Animal-Trap.*—FRANK FLORA, Pierce, Ohio.

Rabbeted jaws instead of the usual plain or toothed jaws; and a single two-piece on the treadle catching in the rabbet.

Claim.—1. The jaws B, made with a rabbet or flange upon their inner sides, substantially as herein shown and described.

2. The toe *d'* formed upon the shank of the bait-pan D to catch upon the jaw B in setting the trap, substantially as herein shown and described.

135,269.—*Pump-Handle.*—ISAAC N. FRAZER, Elmer, N. J.

The lever or handle is made of two pieces joined together. To one of the parts a fulcrum-piece is attached for connecting the handle to the bracket of a pump. The outer end of the other piece is designed for connection to the piston-rod. This construction, gives a drawing motion to the handle and is a substitute for a rigid lever.

Claim.—A bifurcated pump-handle, or lever, composed of the parts A B C, substantially in the manner and for the purpose set forth.

135,270.—*Lock for Sewing-Machines.*—EDWARD L. GAYLORD, Bridgeport, Conn.

A fixed bar, beveled at its lower end, projects through the case of the lock, and has combined with it a pivoted hook-bolt operated by a spring. With this construction there is no need of a second hole in the striker-plate to receive a steady-pin to prevent the case from sliding upon the table.

Claim.—The fixed plate or bar B beveled at its lower end, which projects through the case A of the lock, in combination with the hook-bolt C pivoted at *c'*, and the spring D, all arranged to operate as specified.

135,271.—*Flower-Pot.*—MARCUS B. GOULD, Buffalo, N. Y., assignor to himself and SAMUEL D. OAKE, same place.

A flower-pot has a base water-reservoir, and is provided at the top with a cap, and a tube which extends downward and into the reservoir. Between the cap and the reservoir is interposed a piece upon which the cap and tube are supported. The bottom portion of the tube is provided with holes, through which the water passes into the tube, and thus the plants are watered by capillary attraction.

Claim.—The combination, with the base water-reservoir A and cap and bearing B B', of the flower-pot C provided with conducting-tube C', which extends downward into the reservoir, substantially as herein before set forth.

135,272.—*Card-Rack.*—JEFFERSON J. GRAY, Boston, Mass.

The vertical ribs of a frame have saw-slits curved so as to bend the card when inserted therein and enable its spring to hold it in place.

Claim.—The combination of the curved grooves *s s s* or *s s s s*, with the upright pieces B B' or C C' provided with suitable end pieces A A', substantially in the manner described, as and for the purposes set forth.

135,273.—*Cooking-Stove.*—WILLIAM A. GREENE, Medford, Mass.

The flues for the products of combustion are arranged to encompass the auxiliary oven. The space occupied by the outer end of the flue is taken out of one or both ovens. The wire sifter has a firm frame and is supported under the grate upon a central bar, on which it may be vibrated.

Claim.—1. The flue K, consisting of the portions 8, 9, 10, 11, and 12, constructed and arranged substantially in the manner and for the purpose described.

2. A horizontal flue, formed at and occupying a portion of the back of an oven, substantially as and for the purpose described.

3. The sifter T, composed of wire-netting, and provided with a handle, A, and metallic bands *s*, in combination with the bar U and side plates R R', substantially as described.

135,274.—*Extension Table.*—MATHIAS HOFMAN, Darlington, Wis.

The table-top is made adjustable vertically, and connected by toggle-levers with the two extension frames. Over the end of each frame are rigidly attached leaves, and to these leaves, on each side of the table, double leaves are hinged. When the table is extended, the top rests on the frame between the two rigidly-attached leaves; and when not extended it rests on said leaves.

Claim.—1. The vertically-adjustable table-top A connected by toggle-levers B B with the extension frames C C, and combined with the extension and supporting plates F F, as specified.

2. The combination of the table-top A, jointed toggles B B, the plates F F, and the jointed leaves G G having extensions *d d*, as and for the purpose described.

135,275.—*Paper-Bag Machine.*—TRUMAN HOTCHKISS, Stratford, Conn.

The paper is fed by rolls from under the delivery-table over the recess of the folding-table, where it is held on one side by a spring and on the other by a gravitating bar, when a bag-length is cut by the shears. A right-angular bar, rocked in and out of a vat, applies paste to one edge and part of the rear end. The rectangular former descending, carries the blank into the forming-box, causing its sides to stand vertically, that which dragged from under the bar being longest to form the overlap or seam. The folding-plate moves forward to lay one lap, followed by the opposite combined plate and roller, which lays the other flap and completes a square tube. These folding devices are so connected by levers that one shall move in advance of the other, and the last folder plays under the pasting-table. The side-end folders are reciprocated successively to lay the side folds of the bag end, the pasted one first, over which partially-completed end a paste-roll, vibrated out of a paste-vat, lays a line of paste on the inside surfaces of the top and bottom end folds, the latter being protected by a supporting-lip. The side folders retreating, the upper end folder descends and lays its fold, and, retreating, is followed by the lower-end folder, which completes the bottom. The former now rises, and, as a new feed is accomplished, its interior piston ejects the bag from the former onto a table, from which it is fed by an apron against the upper of a pair of rolls, where a vibrating bar breaks down its upper edge and forces the lower corner of the bottom into the bite of said rolls, which press and deliver it flat.

Claim.—1. The combination, with the recessed table, paper-holding bar, and spring, of the pasting-bars U V, substantially as and for the purpose set forth.

2. The combination with former, recessed table, and end-folders, of the pasting-roller *h'*, substantially as and for the purpose specified.

3. The combination, with the former and with folders g^1 g^1 that do not come quite together, of the pasting-roll *h'*, arranged as described on a spring-bar, *j*, which is rotated by a crank, *l'*, so as to lift said roll to its maximum height, and then thrust it forward between the ends of said folders, as and for the purpose set forth.

4. The combination of pasting device *h' j'* operated by crank *l'*, of the lip g^3 arranged on the plate *r'*, as described, to hold the lower part g^1 of bag, so as to receive the paste from said roll on its downward movement.

5. The combination of plates N *y*, roller *g*, connecting-bar *x*, and levers *w*, arranged as and for the purpose specified.

6. The folding-roller carrying-plate *y*, arranged under the pasting-plate C, substantially as and for the purpose described.

7. The discharger having toothed bar *v* combined with pinions *w' x'*, and toothed bar *v'*, arranged substantially as and for the purpose set forth.

135,276.—*Combined Horse Rake and Tedder.*—GEORGE L. IVES, Rome, N. Y.

A tedder-shaft, by means of swiveled bearings and rearwardly-projecting arms, is attached to the axle of a sulky-rake centrally and at each end, and operated by beveled pinions.

Claim.—1. The combination, with a tedder-shaft and with bars S' S' for connecting the same with the truck or an intermediate frame, of the swiveled bearings W, substantially as shown and described.

2. The combination, with the hay-rake truck, of the attaching devices for the tedder, consisting of the slotted bearing-boxes T for the shaft U, and the crank-arms P, wrists Q, and binding-nuts R, substantially as specified.

135,277.—*Street-Car.*—WILLIAM T. JENKS, Toledo, Ohio.

The lever is connected with the chain-shaft by loose rod or bar. To allow this rod to pass, the wheel of the body is cut away a sufficient space to allow the body to be reversed without disarranging the bar or interfering with the proper working of the brake-lever.

Claim.—A spring-lever, H, having foot-piece I on platform and stop-pin J at the back end, combined with a car pivoted to its truck, as described, to enable driver to lock or unlock the said car and truck, and then turn the former on the latter by means of his horses, as set forth.

135,278.—*Base-Burning Fire-Place Heater.*—WILLIAM MAGILL, Port Deposit, Md.

An induction-draft flue is arranged to cover the top or hood of the magazine, whence the draft-air descends through a flue to the space beneath the grate. An annular smoke-flue is arranged around the magazine, with a ring-damper and direct-draft damper.

Claim.—1. In a base-burning stove, an induction flue or space, D, covering and surrounding the top or hood C of the magazine and inclosed between said hood and the top of the stove-case E, and a diving-flue to carry air from said space D to the bottom of the stove beneath the grate, for the purpose set forth.

2. Combined with the cold-air flue or space D, as described, the annular smoke-flue H, above the fire-chamber and around the front of the stove, as set forth.

3. The combination and arrangement of the ring-damper G in the annular flue H and the angle-damper valve J, substantially as set forth.

4. In combination with the ring-damper G and the flues *d* and H, arranged as set forth, the angle-damper, arranged to close the flue *d* when the orifice is opened, as set forth.

135,279.—*Bedstead-Fastening.*—JOSEPH F. MANCHA, Ridgely, Md.

A casting to be attached to the post, open at the side and top, has a slot in its lower end, and shoulders upon the sides of its open upper end. A casting with shoulders upon its side edges, and a casting having a downwardly-projecting flange, are attached to the rail, which engages with the shoulder and slot on the casting attached to the post.

Claim.—An improved bedstead-fastening, formed of the casting C having a slot, c^3, formed in its closed lower end, and shoulders c^2 formed upon the upper ends of the sides of its open upper end, and whether made in one or two pieces, the casting D having shoulders d^2 formed upon its side edges, and the casting F having a downwardly-projecting flange, *e'*, formed upon its forward edge, said parts being constructed substantially as shown herein and described, to adapt them to operate as set forth.

135,280.—*Fire-Kindler.*—JOHN Y. MARKS, Rochester, Pa.

Pulverized cannel coal, melted resin, sawdust, alcohol.

Claim.—A fire-kindler composed of the ingredients substantially herein described.

135,281.—*Rotary Churn.*—WILSON MCCLURE, Sinking Spring, Ohio.

The legs of the churn are secured to its sides by rods, with nuts thereon, passing through the end pieces, and which may be tightened or relaxed, the legs reaching the top and tending outwardly. The upper bolt passes through a slot in the leg, which admits of vertical adaptation when the sides of the churn move by swelling or shrinkage.

Claim.—1. The spring posts or legs B and rods C, constructed and arranged in connection with the churn-box A, substantially as herein shown and described, and for the purposes set forth.

2. The dasher formed by the combination of the shaft D, radial arms E, and weighted round bars F G with each other, substantially as herein shown and described, and for the purposes set forth.

135,282.—*Rocking-Chair Fan.*—ALOIS NISSLE and JOSEF SCHÖBERL, New York, N. Y.

An auxiliary rocker is pivoted to one of the chair-rockers, and its rear portion heavily weighted. The forward end connects with an endless cord, revolving a friction-roller upon chair-rocker and the pulley upon the fan-shaft.

Claim.—The combination of the weighted lever B, endless cord C, and rotary fan D, friction-rollers *b*, and pulley *d*, with a rocking-chair, for operation substantially in manner herein shown and described.

135,283.—*Angling-Reel.*—CHARLES L. NOE, Bergen Point, N. J.

A fan-wheel connects with the reel gearing to prevent the line overrunning on long casts.

Claim.—The combination, with a fishing-reel, of a fan-regulator, T, and actuating devices connecting it with the reel-actuating gear, substantially as specified.

135,284.—*Milk-Cooler.*—FRANK S. OAKES, Cattaraugus, N. Y.

The bottom of the milk-cooler is elevated so as to form a chamber, which is provided with two water-conducting pipes arranged within the same in different horizontal planes, so that the coldest water and the warmest stratum of milk and the warmest water and coldest stratum of milk are brought into local relation, respectively.

Claim.—1. The arrangement, in a milk-receiving vessel or cooler, A, of two or more water-conducting pipes or their equivalents in different horizontal planes, as herein described, whereby the coolest water and the warmest stratum of milk and the warmest water and coolest stratum of milk are respectively brought into the local relation specified.

2. The pipe *i* and conduit arranged within the partition *h* of the vessel A, as and for the purpose set forth.

135,285.—*Hose-Bridge.*—GILBERT J. ORR and CHARLES E. GUILDERSLEVE, New York, N. Y.

The bridge is furnished beneath its central portion with a screw-clamp, by which means it is securely attached to the surface of the street-rail, and displacement by the passing car is thus prevented, while the hose is protected from injury.

Claim.—The rigid arm *C c'*, hinged arm D *d'*, pivoted open link or U-bar E, and clamping-screw F, in combination with the bridge B, substantially as herein shown and described, and for the purpose set forth.

135,286.—*Furniture-Caster.*—JOHN PARRY, Manchester, Great Britain.

The pivoted bracket of an ordinary furniture-caster, which may be of divers forms, is provided with a grooved wheel or roller journaled in a fork or upward projection of the bracket, and arranged to bear usually at an angle against the under side of a disk or plate on the socket, and forming a part of the caster. An annular rib on this socket, projecting downward, engages with the grooved wheel, thereby relieving the central pivot from lateral strain and strengthening the device.

Claim.—The combination, in a caster, of a grooved wheel on the bracket and an annular rib on the socket, adapted to the wheel as set forth.

135,287.—*Carriages.*—THOMAS B. PATTEN, West Amesbury, Mass.

The standards are constructed with branches on their upper and lower ends, which are firmly secured to braces in the top and bottom of the carriage.

Claim.—1. The means described for holding the rear standards A A of a buggy to its top and body, consisting of a branch and plate connected by suitable fastenings, as described.

2. The means described for holding the front standard of a buggy to its top and body, consisting of one plate bolted to a branch at top, and another plate bolted to a foot extending through frame C at bottom, as described.

135,288.—*Mechanical Movement for Converting Oscillating into Rotary Motion.*—JEFFERSON PEABODY, Bangor, Me.

Both ends of the oscillating beam are connected with the wheel by means of belts which pass over the same side of said wheel, so that whichever end of the beam is depressed it will revolve the wheel in the same direction.

Claim.—The combination of the lever A and string, belt, or chain C with the wheel B and roller *g*, when the parts are so arranged that the ends of the lever connect, by parts of said spring, with the same side of the wheel B, to operate as set forth.

135,289.—*Plow.*—JOSEPH W. REED, Careyville, Mo.

Claim.—The perpendicular standard E attached at one end to beam A, and at the other to land-side F, combined with a mold-board, J, and twisted bar K, all arranged and applied as and for the purpose described.

135,290.—*Cotton-Planter.*—WILLIAM E. RHODES, Darlington Court-House, S. C.

A hopper, on a pair of running-wheels, has one outlet at the bottom, and another at the rear. The former having a dropping-wheel operating in it, the latter permitting a flow, regulated only by a sliding panel, into a guiding-spout.

Claim.—A hopper having aperture *p'*, adjustable slide T, and spout U at the rear thereof, and provided with revolving fingers S on the inside, as described, and for the purpose set forth.

135,291.—*Hay and Cotton Press.*—PETER A. SHEARER, Morristown, Tenn.

Claim.—1. The combination of the plate *p p*, levers D D, combined rollers E E, pulleys E' E', groove *y*, double track F, ropes G G, shaft I, and the false head-block B, all arranged and operating substantially as shown and described.

2. The false head-block B, arranged and operating substantially as described.

3. The roller-pulleys E, in combination with the guide-pulleys E', arranged and operating as and for the purposes described.

4. The combination of the iron plates *p p* with the levers D D, substantially as described.

5. The combination of iron plates *p p*, levers D D, roller-pulleys E E, guide-pulleys E' E', double track F, and groove *y*, substantially as shown and described.

6. The ropes G G attached to staples K on the shaft I, and passing over pulleys E E and between guide-pulleys E' E' in grooves *y* toward and secured to staples H, substantially as shown and described.

135,292.—*Glass-Press.*—ALBERT M. SMITH, Brooklyn, N. Y.

The material in a plastic state is laid across the die, and the necessary quantity for the button, center stone, &c., is first cut off

by the slotted ring, thus finishing the article on the edges. It is then completed by the descent of the plunger.

Claim.—The combination of the plunger A, spring D, and slotted ring C with the die B for first cutting off the required amount of glass, and then pressing it into the die, by which the article is formed and finished on the edge at one operation, substantially as herein set forth.

135,293.—*Device for Transmitting Motive Power.*—ROSWELL T. SMITH, Nashua N. H., assignor to himself, J. G. BLUNT, J. K. PALMER, and WILLIAM EARL, same place.

A device for transmitting motive power in any desired direction and to any position by means of a system of shafts and gearing in which stirrups are so adjusted as to allow vertical and horizontal play.

Claim.—1. The shaft *k* and spur-wheel *b'*, supported by a standard, A, as means for transmitting rotary motion to a spur-wheel, *c*, on a shaft, *d*, which latter has its bearings in a horizontally-articulating stirrup, D', and has pivoted to it the stirrup D of a vertically-vibrating arm, G, substantially as described.

2. The revolving balanced shaft G', applied to articulate or swing on a standard, A, the shaft K, and their intermediate gear-wheels, combined substantially as and for the purpose described.

3. The combination of the vertical shaft A, the horizontally and vertically movable shaft G', the pendent swinging rod K, and gear-wheels universally connecting the same, substantially as described.

135,294.—*Hand-Planter.*—SIDNEY S. STULTS, Cedar Bluffs, Neb.

A strip of wood, reaching from the hand to the ground, has a handle at the top, a hopper at the back, with a curved seed-slide reciprocating therein and below it, a spout in front, and one of a pair of jaws at the bottom. The other jaw is at the bottom of a short stem to which the slide is attached. This stem is pivoted to the piece described, the jaws being held closed by a curved spring at the back of the stem. In front of the latter is an arm curving forward to the ground with a foot-piece at the bottom. The implement, used like a walking-stick, having been thrust into the ground, and its top pressed forward, pressure on the foot-piece opens the jaws at the time they are being withdrawn.

Claim.—The combination of the foot G, lever J', spring H, and staff A, with the jaws A' B' pivoted together at K, as shown and described.

135,295.—*Bearing for Spindles.*—JOSEPH TAYLOR, Jr., and JAMES PEART, Sheffield, England.

Claim.—1. The combination, with an ordinary solid bored or bushed bearing, of an adjustable bush of hard metal, made conical at one end, for maintaining in position a revolving shaft or spindle, substantially as hereinbefore described, and illustrated by our drawing.

2. The combination of the oil chamber, oil-cup, and aperture *h*, with the said adjustable conical bush, as and for the purpose hereinbefore described, and illustrated by our drawing.

135,296.—*Inkstand.*—JAMES B. THURSTON and FRANK M. WEST, New York, N. Y.

The bottles are suspended in a disk which is spring-seated, and revolves on a central post in frictional contact with the cover, being locked in position coincident with the opening in the cover by a simple detent.

Claim.—1. The ink-receptacles E, suspended by their upper edges from the perforated disk C, which is mounted on the post B so as to rotate in frictional contact with or directly beneath the cover D, as described.

2. The spring *a* and the locking projection *d* arranged in combination with the swiveled disk C of the multiple inkstand, as set forth.

135,297.—*Clutch Mechanism for Treadles for Sewing-Machines.*—JOSIAH TISDALE, Norwood, Mass., assignor to himself and JOHN PUTNAM, same place.

Rotating the fly-wheel by means of clutches connected to the reciprocating levers of the treadle.

Claim.—1. The gripers D E, the springs *l l*, and the jointed arm parts A f A f, constructed, arranged, and combined together and applied to a shaft-flanged disk and treadle, in manner and by means substantially as described.

2. The stationary shouldered arbor, the band-wheel, the flanged disk, the jointed arms F G, the gripers D E, and springs *l l*, arranged, constructed, and combined substantially in manner and to operate as shown and described.

135,298.—*Furnace for Burning Coal-Dust, Small Fuel, &c.*—JEAN TISSOT, Paris, France.

Claim.—1. The combination, with the bridge of a furnace, of an air-chamber, and openings arranged to permit the air to pass out at the rear side of the bridge, as set forth.

2. The combination of the air-passage with its register R, the ash-pit C, grate G, bridge-walls A and A', hot air chamber F with its perforations, and the register R', all substantially as described.

3. The combination, substantially as described, of the chamber D, with a furnace into which air is forced for the support of combustion.

135,299.—*Tug-Fastening.*—JONATHAN TURLEY, Mitchell, Ind.

A suitable hook is secured to the inside of a trace near its rear, and is attached to a socket-loop on the end of the whiffletree. The trace is thus made to extend beyond and cover the end of the whiffletree.

Claim.—The combination of hook on inside and near rear end of trace with loop-sleeve F G arranged on end of whiffletree, as and for the purpose described.

135,300.—*Railroad Track.*—DANIEL S. TUTHILL, Newburg, N. Y.

A wheel with an independent tread is provided to co-operate with the short piece of rail at the joint to relieve the pounding at the joint by temporarily transferring the weight to said short rail at that point.

Claim.—The combination, with the main rails A, of the short rails C at the joints, and car-wheels with treads adapted to work on said short rails, substantially in the manner described.

135,301.—*Corn-Coverer.*—JOHN TWEEDY, Vernon, Ind.

A clod mover of a triangular or V shape, loosely attached to the rear part of a cultivator-plow so as to adjust itself to the shape of the ridge and removes clods or other obstructions that might prevent corn from coming up.

Claim.—1. The clod-mover I, in combination with the semi-circular or arched mold-board H and plows G, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the long staples J, rod K, and guide or keeper L, with the clod-mover I, semicircular or arched mold-board H, and beam A, substantially as herein shown and described, and for the purposes set forth.

135,302.—*Lumber-Chute.*—WILLIAM VAN HAME and JAMES A. WAKEFIELD, Chippewa Falls, Wis.

Water is admitted beneath the hinged pieces through the passage from the flume. By this means the dam is elevated to the required height, the apron and finger-bars forming, with the bed-piece, a chute continuous with the slope of the dam, and merging into the bed of the stream. An outlet is provided for the lowering of the dam.

Claim.—1. The combination and arrangement of the bed A, piers B, dam C, gate D E, chamber H, dome K, passage I L, and gates therefor, all substantially as specified.

2. The apron M hinged to the bed-piece, and the bar P hinged to the apron, substantially as specified.

135,303.—*Ironing-Table.*—ABRAHAM WECHSLER, New York, N. Y.

An ironing board or table arranged at or near its center, with an adjustable or movable board, which is temporarily attached to it by tenons and staples, to be removed at pleasure, and the space occupied by a cover formed to hold and give shape to a shirt, &c., which is supported at its end by a frame passing under it and attached to a lever working under the table, by which it is moved in and out, and is provided on its outer end with uprights for holding the article to be ironed. The table is also provided with a hinged bar attached near its center, which can be passed over and firmly hold the shirt while being ironed, all of which can be removed and the table restored to an ordinary form for common use.

Claim.—1. An ironing-table provided with the movable top C, ironing-board D, and slide F, substantially as described.

2. The bar E, applied in conjunction with the subject-matter of the foregoing clause, as and for the purposes described.

3. The lever G, combined with the sliding frame F and uprights *g* to operate the same, as specified.

135,304.—*Turn-Table.*—WILLIAM WHARTON, Jr., Philadelphia, Pa.

The car is reversed by a semi-revolution of the table and run out upon a different track, leaving the table in position for future use without readjustment.

Claim.—The turn-table with two tracks, the rails of which are arranged side by side, in combination with the tracks of a permanent way, all substantially as described.

135,305.—*Tobacco-Topper.*—JOHN S. ACKLEY and DAVID S. RANNEY, Modus, Conn.

The cot is provided with an opening on the upper side for the knuckle of the thumb, and its interior is provided with a suitable lining.

Claim.—The combination of the elastic cot or stall A and the knife-blade B, constructed and arranged substantially as and for the purposes herein set forth.

135,306.—*Corn-Sheller.*—AUGUSTUS ADAMS, Sandwich, Ill.

The grate or screen is inclined from the side of the box toward the picker-wheel, causing the cobs to press against the same sufficiently to be carried forward and thrown out of the discharge-opening, the shelled corn falling through the grate into a suitable receptacle.

Claim.—1. The inclined grate or screen D placed between the picker-wheel and side of the corn-sheller, substantially as described, for the purpose specified.

2. The inclined grate or screen D in combination with the picker and feed wheels of a corn-sheller, substantially as described, for the purpose specified.

3. The guide block or plate G in combination with the inclined grate or screen to permit the discharge of the cobs from the machine, substantially as described.

4. The discharge-opening E A, the inclined grate or screen D, and the guide block or plate G in combination with an ordinary picker-wheel corn-sheller, substantially as described, for the purposes specified.

135,307.—*Potato-Digger.*—HANSON G. BARROWS, Benton, Me.

A potato-digger constructed of the ordinary shovel, with a series of parallel fingers projecting backward from the side of the sole or base of the standard in an oblique horizontal direction for depositing the potatoes free from the earth.

Claim.—The combination, with the standard E and shovel or excavating plow H, of a series of parallel fingers or tines, I, extending horizontally in an oblique direction from the sides of the standard, as and for the purpose specified.

135,308.—*Shoemaker's Edge-Plane.*—FREDERICK F. BAUMANN, Cambridge, Mass.

The adjustable gage admits of the use of the same tool in trimming and burnishing soles of varying thicknesses.

Claim.—The movable and adjustable lip or gage *n o*, substantially as described, in combination with the fixed lip or gage *m*, and the cutting or burnishing edge or face over which the adjustable gage moves.

135,309.—*Barrel-Truck.*—VERNON BELL, Minneapolis, Minn.

In letting down or taking up out of a cellar, or moving up or down any other steep grade, the truck is manipulated by means of the rope, and when this rope is drawn tightly, the guide through which said rope passes prevents the truck from tipping and causes it to run in line with the rope.

Claim.—1. In combination with a barrel-truck, the levers E E pivoted to the truck-frame, and having hooks *a a* formed upon their outer ends, and operated by means of the springs *d d*, substantially as and for the purposes herein set forth.

2. The combination of the frame C D D', axle A, wheels B B, swinging or pivoted levers E E, with hooks *a a*, springs *d d*, stationary hooks G, and swinging hook H, all constructed and arranged to operate substantially as and for the purposes herein set forth.

3. In combination with the barrel-truck herein described, the arrangement of the rope *n* and guide *f*, substantially as and for the purposes herein set forth.

4. The combination of the wheels B B with toothed flanges *s s*, axle A, arms *f f*, pawls A A, rod *i*, and spring *h*, all substantially as and for the purposes herein set forth.

5. In combination with the pawls A A and rod *i*, the cord *m* and lever I, substantially as and for the purposes herein set forth.

135,310.—*Leather-Dressing Compound.*—FREDERICK G. BELL, New York, assignor to SAMUEL E. COX, Haverstraw, N. Y.

Castile soap, twenty pounds; common soda, sixteen pounds; bayberry tallow, one-half pound; carbonate of ammonia, one-half pound; borax, one-half pound; gum-tragacanth, one-half pound; lamp-black, two pounds; neatsfoot-oil, two gallons; water, eighteen gallons.

Claim.—The process of preparing dressing for leather, substantially as described.

135,311.—*Rotary Steam-Engine.*—JOSEPH B. BENNETT, Brooklyn, N. Y.

Circular springs are arranged in the recessed ends of the revolving cylinder to force out the pistons. These are provided with a small hole, which is covered by springs and constitutes a trap for steam to assist the circular springs in forcing out the pistons. Packing is arranged in the inner face of the hub of the covers to prevent the oil being blown from the shaft. The steam is admitted simultaneously behind two pistons on opposite ends of the abutments.

Claim.—1. The combination of the casing A having ports *b b'* with the inner revolving cylinder B provided with pistons D and circular springs E, constructed and arranged substantially as set forth.

2. The pistons D provided with springs *d* and holes *d'*, in combination with cylinder B, arranged as and for the purpose set forth.

3. The combination of the cover having hub provided with packing *e* with the cylinder B and casing A, constructed and arranged as and for the purpose described.

4. The combination of the casing A, steam-chest F, and valve G with the revolving cylinder B, pistons D D', and springs E, all constructed and arranged as shown, and for the purpose set forth.

5. The circular springs E arranged to operate the pistons D, in the manner and for the purpose set forth.

135,312.—*Nail-Separating Machine.*—BENJAMIN REVELANDER, Boston, Mass.

The nails are thrown into a hopper, where a vertically-reciprocating lifter with an inclined end carries them upward singly, when they fall into a second hopper, from which they are raised in like manner and fed separately to an inclined chute, down which they slide against a gage, where they are struck by a slide and made to turn onto their flat sides in order to pass under the gage. From this gage they slide down and rest against a bar, where a starter strikes their heads, sending them from the machine head foremost.

Claim.—1. In combination with the box or hopper *b*, the vertical lifter *d*, having the inclined top for lifting and discharging the blanks, and the agitator *l* operated by it, substantially as shown and described.

2. In combination with the box or hopper *b* and lifter *d*, the chamber *k* and lifter *n*, substantially as shown and described.

3. In combination with a chamber for entering and a lifter for raising the blanks one by one and discharging them, the inclined chute and the bar *u*, against which it next strikes.

4. In combination with the chute *o* and bar *u*, the starter-bar *x*, operating substantially as described.

5. In combination with the chute *o*, the gage-plate *o'* and slide *f'*, operating substantially as shown and described.

6. The combination of a blank-containing box or receptacle, mechanism for lifting, agitating, and for discharging blanks therefrom one by one, and mechanism for insuring the delivery of the blanks one by one, right face up, and head first, all substantially as shown and described.

135,313.—*Drilling-Machine.*—PARMITT BLAISDELL, Worcester, Mass.

The drill-shaft revolves in a movable bearing or sleeve, which is connected by a chain to a weight that balances their weight. The drill is raised and lowered by a pinion acting on a rack on the drill-shaft bearing. The worm-wheel on the shaft, with the pinion, is turned by a screw in a sliding bearing, which is thrown in or out of gear by a cam.

Claim.—1. The combination, with the spindle and its movable bearing in an upright drill, of a balancing device or mechanism, whereby, when the drill and its bearing and the drill-head are raised and lowered, the balance of the drill will remain the same, for the purposes stated.

2. The combination, with the frame A, spindle and spindle-bearing D C, of the balance-weight B and cord or chain *a*, substantially as and for the purposes set forth.

3. The combination, with drill-head F and drill bearing-piece C, of shafts *f* and *m* and gears *e*, *g*, and *n*, substantially as and for the purposes set forth.

4. The combination, with shaft *m*, worm *n*, and their frame, of handle S and cam *t*, as and for the purposes set forth.

135,314.—*Die-Plate.*—FRANCIS D. BLISS, New Bedford, Mass., assignor to himself and DARIUS P. GARDNER, same place.

These dies are constructed with flat faces on their peripheries so that two of the cutting-corners can be ground upon an ordinary grindstone at one time. The carriers that hold the dies are connected by means of screws, which can be made to adjust the carriers out of parallelism to each other for throwing the cutting-corners alternately nearer together on each side as they in turn out forward and backward upon the screw.

Claim.—1. The combination of the two die-plates with the two independent carriers, connected by the screw-bolts *f*, and arranged to be adjustable with relation to each other, substantially as and for the purposes specified.

2. The polygonal die-plates A and B, constructed substantially as described, with flat faces intervening between the tapped recesses, as and for the purposes specified.

135,315.—*Transparent-Slate Frame.*—WILLIAM F. BOUCHER, Philadelphia, Pa.

The back board is made longer than the inner length of the frame, and is held in place by springs.

Claim.—1. In a transparent slate, the combination, with the frame, of one or more springs operating to hold the writing glass and back board in the frame, substantially as set forth.

2. The frame B with grooves F, the lengthened glass C, back board E, and one or more springs, G, combined and operating substantially as set forth.

135,316.—*Car-Coupling.*—DAVID BRADFORD, Hamilton, Canada.

The cars are brought together and the buffers, coming in contact, are pushed inward until the hooked spring is thrown from engagement with the projection on the coupling-bar of one car, when the coupling-bar is revolved a quarter-turn by the spring at its rear, the bar having entered between the vertical bars on the other car, the corresponding coupling-bar on the other side having performed the same operation. Uncoupling is effected by means of levers.

Claim.—1. The revolving coupling bars D D with projections F F, notched disks G arranged in combination with vertical bars C C, and operated substantially in the manner and for the purpose shown.

2. The arrangement of the lateral spring-catch E, operating in combination with the coupling bar D.

3. The arrangement of the notched disk G on the coupling-bar D, the pin H, and spring J, all combined to operate the coupling-bar and prevent its entire revolution.

4. The arrangement of the series of levers K, K, and L, as shown, in combination with the coupler D for uncoupling from either side of the car-platform or top of box-car, all arranged substantially as and for the purpose set forth.

135,317.—*Apparatus for Expressing Liquid from Spent Tan-Bark.*—LAURENT BREVAL, Paris, France.

Within the space which is formed between the delivery and the main compressing rollers is arranged a perforated strainer, to convey the bark from one set of the rollers to the other, and it is so constructed that the liquid which is expressed from the bark may pass off through it to the sewer.

Claim.—The combination of the rollers or cylinders A B C and the perforated bar D, arranged as set forth, the rollers B C being provided with mechanism for revolving them, as specified, and the upper of said rollers B C being movable vertically and furnished with pressure devices, essentially as described, and the system of rollers A B C and perforated bar D being provided with a hopper, T, a liquid-receiver, G, and an inclined discharger or plane, J, or one or more of each, as occasion may require, the whole being substantially as and for the purpose as explained.

135,318.—*Washing-Machine.*—WILLARD P. BROOKS, Lawrence, Kan.

A tub with radial ribs in the bottom and radial grooves in a follower attached to a hinged cap and oscillated by horizontal and oblique levers.

Claim.—1. The combination of the oblique hand-lever G with the horizontal hand-lever F, connected to each other and to the hinged cap C, as described, with an oscillating follower, D, of a washing-machine, essentially as and for the purpose described.

2. In a washing-machine, the combination of the grooved oscillating follower D, hinged cap C, oblique and horizontal levers F G, beveled opening, and the tub constructed with ribs *n n'*, as described, the several parts being constructed and arranged for operation substantially as described.

135,319.—*Shutter-Fastener.*—NICHOLAS H. BYERLEY, Philadelphia, Pa.

A single piece of wire is bent and coiled to form a spiral or coil spring, the two ends or arms crossing each other and terminat-

ing in loops or hooks, to engage with the rings of the window-shutter. There is also a tightening and adjusting ring, which passes over the arms of the spring and serves to contract or adjust it, and thus fasten or bow the shutter at varying distances.

Claim.—The spiral spring A, with its arms B and loops or hooks C, in combination with the tightening-ring D, substantially for the purpose shown and described.

135,320.—*Vent.*—ORRIN S. CAMP, Grand Rapids, Mich.

A flattened flexible rubber tube attached at one end to a perforated stopper.

Claim.—The automatic vent herein described, constructed of the flattened tube C and perforated plug A, arranged as specified.

135,321.—*Manufacture of Runners and Top-Notches for Umbrellas.*—THOMAS COX and WILLIAM HOLLAND, Birmingham, England.

The runner or barrel is formed of sheet-metal and is flanged at the bottom, where a bead, formed of a cupped piece of metal with the center cut away, is pressed onto it. A shoulder on the runner near the top prevents the notch-ring from slipping down, and the runner being riveted over the ring, holds it on. The whole is then soldered together.

Claim.—The improvements in the manufacture of runners and top-notches for umbrellas and parasols herein before described and illustrated in the accompanying drawing—that is to say, temporarily fitting the notch-ring and bead of the runner in their places on the runner tube or barrel and the notch-ring on the top-notch tube, substantially in the manner described and illustrated, and soldering or firmly connecting the parts together by immersing or partly immersing the combined article or partly-made runner or top-notch in a bath of melted zinc, or of the other metals or alloys herein before enumerated.

135,322.—*Music-Leaf Turner.*—GEORGE DOMINY, Weymouth, England, assignor of one-half his right to JAMES RUSSELL, same place.

Claim.—1. The case I^4 containing the series of spring-impelled drums I^1, in combination with the radial arms I constructed to work in the same horizontal plane and provided with the fingers or clamps I^2, all arranged to operate substantially as described.

2. In combination with the arms I, the flexible helical fingers I^3 and vacuum-checks I^5 or their equivalents, substantially as shown and described.

3. The releasing-catch J, constructed of a series of compound levers, J^1 J^2 J^3, and catches J^4 and J^5 or their equivalents, arranged and operating substantially in the manner and for the purpose set forth.

4. The combination of the stave E^1 and center pin H^2, adjustable in relation to each other by means of the spring H^3 or its equivalent, and arm C G with its attachments, substantially as and for the purposes herein specified.

5. In a music-leaf turner, the catch K pivoted to the slotted plate and acted upon by a spring, as described, for the purpose of holding the leaves, substantially in the manner set forth.

135,323.—*Butter-Printing Machine.*—DAVID E. DUTROW, Washington, D. C.

The printing is accomplished within a vertical transparent hopper or cylinder, that the operation may be observed in its progress.

Claim.—1. In a machine for printing butter, the hopper in which the plunger operates, when said hopper is made of glass or other transparent material, substantially for the purposes herein set forth.

2. The combination of a hopper, a follower for pressing the butter down, and a movable print for receiving the butter and throwing it up after it is printed, substantially as herein set forth.

135,324.—*Apparatus for Treating Oil.*—ALFRED EDWARDS, New Haven, Conn., assignor to ALFRED R. EDWARDS, Chicago, Ill.

Air is forced into the air-chamber, which partially surrounds the cylinder, so as to prevent the direct contact of the fire and to heat the air which is afterward admitted into the cylinder to facilitate the rendering.

Claim.—1. The cylinder A, provided with the shaft B carrying suitable agitators, combined with the air-chamber H beneath the cylinder and the furnaces D, more or less in number, the fires in which set directly upon the casing G of the said chamber H, and pipes W opening communication from the said chamber directly into the cylinder to allow the passage of heated air directly from the said chamber into the said cylinder, substantially as set forth.

2. In combination with the rendering-cylinder A and an agitating device working within, the escape-pipe a and condenser-chamber b, the receiving-chamber h, outlet n, and with the water-supply m, substantially as set forth.

135,325.—*Cooking-Stove.*—MICHEL G. FAGAN, Troy, N. Y., assignor to himself and ALBERT C. COMER, same place.

Improvement on his patent 94,193 of 1869. The rear chamber or pit, similar to the front fuel-chamber, is adapted to receive either a fire-box or a water-reservoir; said chamber may extend partly or wholly beyond the rear end of the stove. The water-reservoir may be placed partly or wholly below the top-plate.

Claim.—1. A cooking-stove provided at its rear end with a chamber or pit similar in general form to the fuel-chamber situated at its front, when said pit or chamber is situated wholly or in part beyond the rear end of said stove, substantially as and for the purpose specified.

2. A cooking-stove provided at and within its rear end and upper side with a second and supplemental fuel-chamber, when said chamber is situated wholly or in part beyond the rear end of said stove, substantially as and for the purpose shown.

3. In combination with the pit or chamber K, situated at the rear end and upper side of the stove, and extending wholly or in part beyond said end, a water-reservoir, S, placed wholly or in part below the top plate E, substantially as and for the purpose set forth.

4. The combination and relative arrangement of the top flue Q, rear flues L and M, exit-flue R, chamber or pit K, and damper P, substantially as and for the purpose shown and described.

135,326.—*Machine for Cutting Food for Animals.*—REINHOLD FANSLAU, New Haven, Conn.

The cutters are protruding lips on the face of a cylinder with a semicircular cut below or in front of each lip.

Claim.—The sheet-iron cylinder C provided with the projecting cutters *d o d o*, formed by first cutting half-circle perforations in the sheet metal and then stamping upward the curved portions *d d* of the cutters, so as to form an arch, diminishing as it recedes from the punctures *o*, in arrangement with the frame A and box B, when constructed and operated in the manner and for the purpose set forth.

135,327.—*Securing Carriage-Wheels to their Axles.*—HERMANN S. FISCHER, Xenia, Ohio, and DATLEF BRUHN, Eckernforde, in Schleswig, Prussia.

The wheel is secured upon the axle by providing the latter with a circumferential groove, and the wheel with a transverse key bearing in said groove.

Claim.—In combination with the grooved axle A and the axle-box B, the transverse key C provided with an enlargement on its forward end, and with a nut or its equivalent on the rear end, as shown and described.

135,328.—*Sad-Iron.*—WILLIAM A. FREEMAN, Jr., Newark, N. J.

A tongue projecting on the front of the detachable handle engages with a loop on the top of the detachable heater so that the heater can be lifted out of the polishing-shoe.

Claim.—The tongue A on the detachable handle D, in combination with the loop *b* on the detachable heater A, substantially as shown and described.

135,329.—*Machine for Separating and Delivering Tacks.*—CHARLES W. GLIDDEN, Lynn, Mass.

Above a tack-containing hopper is a rotary cylinder having a soft surface. The hopper is raised intermittently to bring the tacks into contact with the cylinder; their points stick into the latter and they are carried around with it until stripped off, by means of a comb-like plate, into the spaces of which the shanks of the tacks slide. As these spaces converge into one main passage the tacks all slide down and form in a single column and drop into a tube, through which they pass to be driven.

Claim.—1. The tack receiving, separating, and delivering plate *r* having the points or teeth *t*, converging slots *s*, and main slot *u*, substantially as shown and described.

2. In combination with the tack receiver and separator, the tack-presenting cylinder *c*, operating substantially as shown and described.

3. In combination with the tack-receiver and separator, the finger g^2 for removing the tack singly, substantially as described.

4. In combination with the tack receiver and separator, the guiding-tube p^3, substantially as described.

5. The combination, with a tack-presenting mechanism, of the tack receiving and guiding mechanism, substantially as described, that delivers the tacks one by one, point downward.

135,330.—*Horse Hay-Rake.*—CHARLES NATHANIEL GOSS, Claremont, N. H.

Stub-axles, cast with the attaching-plate, are attached on the outside of the frame, which frame has a common pivoting-rod, for independently-pivoted teeth, in front of the axial line of the supporting-wheels, between which an unobstructed space is left for the movement of the teeth.

Claim.—1. A horse hay-rake having in combination the following elements, namely: side beams with stub or short axles affixed to the outsides of the same and a system of teeth independently pivoted forward of a line passing through the axes of the supporting-wheels, leaving the space to the rear of the pivotal line occupied only by the teeth, the devices for lifting the same, and the clearer-bars H, or their equivalents.

2. For use in a horse-rake, the plate G, constructed as shown and described—that is, angular in cross-section on its inner face, and on its outer faces provided with the strengthening ribs and protecting-flange and with a journal.

3. In combination with the sleeved tooth-head, provided with the flaring tooth-steadying flanges or walls 6 6 and a bolt-hole, a tooth having an eye therein whereby the head and tooth are secured firmly together.

4. The lifting-bar or treadle combined with the guide-yoke 7 and its friction-pulley, the rear end of the lever playing freely through the yoke, all substantially as shown and described.

135,331.—*Horse-Power.*—ANDREW G. HAGERSTRÖM, Red Wing, Minn.

Claim.—1. The draft-bars O and O', constructed as set forth and combined with each other by means of the bands P and pivoted tongues Q, substantially as and for the purpose shown.

2. The device as a whole, when its several parts are constructed and combined substantially as and for the purpose set forth.

135,332.—*Machine for Sawing and Splitting Wood.*—ANDREW G. HAGERSTRÖM, Red Wing, Minn.

The wood falls from the saw upon block W and is split by a

revolving knife, after which it is removed from the block by a holder which is actuated by a cam on the driving-wheel.

Claim.—1. The splitting blade or ax Y and block W, when constructed as shown, and combined with the frame of the machine and with the operating mechanism, substantially as and for the purpose set forth.

2. The means employed for sustaining the block while being split, and for afterward dumping the same, consisting of the holder X, the rock-shaft A' provided with the arms B' and C', the connecting-rods D' and E', the wooden bar F', and the metal bars G', when constructed as shown, and combined with each other, with the frame of the machine, and with the driving-wheel, substantially as described.

3. The means employed for furnishing a rolling support to the machine, consisting of the ground-wheels I', the forked pivoted bars K', the hooked rods M', the staples *m'*, the caster N', the roller O', the brace Q', and the draft-rod R', when constructed and combined with the frame of the machine, substantially as specified.

135,333.—*Artist's Scraper.*—HENRY J. HAIGHT, New York, N. Y.

A conveniently-arranged tool to remove paint by a graduated line from the edges of canvas, and clean pallets, &c.

Claim.—The sharpened edges *p p p* and *m*, as above described, and also the serrated and sharpened edges *e e e e*, with the movable oval-shaped metallic index-plate, Fig. 1, J, in combination with the graduated scale *m*, Fig. 1, as above described, and shown in the drawing.

135,334.—*Telegraph-Insulator.*—NATHAN HENDRICKS, Jersey City, N. J.

The head of the bar to which the wire is attached is inserted between two blocks of glass, which are confined by means of a base-plate and removable supporting-pins within a flanged box of suitable shape.

Claim.—The blocks D and E, constructed as described, and having confined between them, in a flanged box, A, the head of a suspension-bar, G, substantially as and for the purposes set forth.

135,335.—*Smoothing and Fluting Iron and Holder.*—JOHN HEWITT, Albany, N. Y.

A sad-iron plate and a corrugated faced handle-plate detachably connected, so that the handle-plate can be used with the corrugated face of the iron-holder. The two center ribs on the handle-plate extend its entire length, for use in ironing a single flute.

Claim.—1. The handle-plate B, corrugated so that its center ribs extend throughout its entire length to permit of the toe of said plate being used to iron a single flute.

2. An iron consisting of the sad-iron plate A and corrugated-faced handle-plate B, when said plates are so connected as to allow of their ready detachment to permit of the corrugated handle-plate being used in connection with the corrugated face *d* of the iron-holder D for ironing fluting, substantially as described.

135,336.—*Counting-Register.*—RUSSEL P. HINDS, Chicago, Ill.

The lock-wheels of a counting-register formed of a series of concave curves, adapted to the cylindrical portion of each preceding wheel, are provided with an impulse pin or tooth situated beneath the said concave serrated wheels and at about the middle point of the concave.

Claim.—As a means for transmitting rotary motion from a smooth wheel to a wheel having a series of peripheral concaves, the arm *h* upon the former arranged to strike lateral pins upon the latter at a point directly in line with the center of the two wheels and midway between the points *i* of the concave wheel, substantially as described, for the purpose specified.

135,337.—*Mortising-Machine.*—LEVI HOUSTON, Smithville, N. J.

The chisel is reversed by positive mechanism controlled by a lever and operated by a treadle. The bearing for the chisel is in conical opening, which can be tightened by a nut and screw as the same continues to wear away.

Claim.—1. In combination with the reciprocating chisel-spindle of a mortising-machine, a disk, D, with its pins *a* and *b*, the slide F, or its equivalent, and pawls E and E'.

2. The combination of the above with the pins *a a* and stop *f*.

3. The combination of the reversing device forming the subject-matter of the first claim with the treadle H for controlling the work-table and the intervening mechanism, whereby the table and reversing mechanism are caused to work in unison, as set forth.

4. The combination, substantially as described, with the reciprocating chisel-spindle A, of the adjustable conical split bearing B.

135,338.—*Machine for Twisting Oakum.*—LEWIS HOWARD and CHARLES HOWARD, Watkins, N. Y.

The spring-fingers, carried by the inner tube, bear upon the oakum and cause it to be twisted as the tubes revolve, and the guides condense and give it the desired shape and size.

Claim.—The rotary tube D, tube E having spring fingers F, guides I I, and drawing-rolls H H, combined and arranged as described, to form an improved machine for roping oakum.

135,339.—*Metal-Coating Tacks, Nails, &c.*—CYRUS D. HUNT, Fairhaven, Mass.

The articles are cleaned by acid mixed with a flux of resin and sal-ammoniac and a sufficient quantity of the metal with which the article is to be coated. They are then put in a closed cylinder, which can be run into a furnace, where it is kept in motion until the metal is melted and the articles coated. The articles are then washed in water and dried in sawdust.

Claim.—The within-described method of coating tacks, nails, screws, and other articles with tin, lead, or zinc in a cylinder, as herein set forth.

135,340.—*Screw-Driver.*—FRANKLIN B. HUNT, Richmond, Ind., assignor to EDWARD R. MATTHEWS and WILLIAM N. MATTHEWS, same place.

Headless screws are driven into or removed from the wood.

Claim.—The combination of the barrel A, jaws C, plunger B, and spring-band I, when operating in the manner and for the purpose substantially as described.

135,341.—*Plane for Scraping.*—JOSEPH JONES, Newark, N. J., assignor to WILLIAM A. FREEMAN, same place.

Claim.—The combination, with the holder D having lugs *g*, of the slotted supports F pivoted to the stock A and the tightening-bolt G, the whole arranged and operating substantially as and for the purpose herein set forth.

135,342.—*Carpenter's Bench.*—JOSEPH JONES, Newark, N. J., assignor to WILLIAM A. FREEMAN, same place.

The back hook is made adjustable in a slot and held by a pawl in the rack-plates. A coiled spring holds the hook to its place. A dog releases the pawl when the hook is to be moved backward.

Claim.—1. The combination, with the forward bench-hook B, of the back bench-hook C, the slide D, the lever E, and one or more springs, F, substantially as specified.

2. The independently adjustable back bench-hook C, in combination with the slotted slide D, the lever E, and spring or springs F, essentially as described.

3. The racks H H of the slotted slide D, in combination with the back bench-hook C and spring pawl or catch *f*, substantially as specified.

4. The springs *d d*, in combination with the stationary pieces *c c* and legs *b b* of the bench-hook B, essentially as and for the purpose herein set forth.

135,343.—*Car-Axle Box.*—JACOB KIEZER, Pittsburg, Pa.

The lid is provided with recesses and projections, which prevent the nut and bolt from turning or becoming loose. The addition of lugs and spring makes the lid complete in itself.

Claim.—1. In an independent hinged lid for journal-boxes, a wrought-iron bar, G, so curved and arranged as to serve the triple purpose of connecting the lugs I I, forming a bearing for the spring F, and supports for the hinges H H of the lid, all as shown and described.

2. A lid for journal-boxes with projecting arms C C and recessed openings C' C', operating, when the lid is closed, as a lock device to prevent the turning of the bolts and nuts, substantially as set forth.

3. The combined arrangement of the lid B having arms C C and recesses C' C', the spring F, the bent rod G, the lugs I I, forming an independent hinged lid for journal-boxes, substantially as shown and described.

135,344.—*Snap-Hook.*—WILLIAM W. KITCH, Crestline, Ohio.

At the end of the rein to be buckled are cut or punched apertures. The end of the band is pushed through the opening or slot between the bars *c* and *h*, and drawn around the bar *a* and pulled out under the bar *a*, one of its apertures resting over the pin *h'*, and in which position it is readily held.

Claim.—The plate A having a slot, C, which terminates in recessed heads *c c*, so as to afford within said slot suitable bearings for the free and undetached ends of the plate-spring C', in combination with tongue D having shoulders *d d*, the whole being so constructed, secured, and arranged as to operate in the manner described, as and for the purpose specified.

135,345.—*Machine for Selecting and Delivering Nails.*—ALDEN KNOWLTON, Boston, Mass., assignor to JAMES W. BROOKS, trustee, same place.

The nails are fed in a mass through a box into a deep groove in a reciprocating block. The groove is just large enough to receive a nail, and the latter rests while in the groove upon a long slide, which reciprocates intermittently and carries the nail to one side of the machine. When the slide stops at the limit of its movement the nail is dislodged and simultaneously therewith the opposite end of the slide is under the box receiving another nail, which is carried to the opposite side of the machine as before and dislodged there.

Claim.—The combination of the nail-containing box *b*, the block *c* with its groove *d*, and the nail carrier plate *e* with its nail-lodging edge or edges *h*, and devices for effecting dislodgment of the nails therefrom, all substantially as shown and described.

135,346.—*Door-Check.*—JONATHAN KOLB and ALBERT KOLB, Oxford, Ind.

The ordinary rubber-head door-bumper secured to the wainscot is provided with a ribbon-spring, bent to form a bulge in the middle, and fastened by its two ends to the side of the bumper. There is also a loop-spring, made of heavy wire, forming a rectangular loop with spiral arms, and this device is attached to the door in such manner that when it is swung back the bulge or angle of the ribbon-spring engages with the loop-spring and holds the door open, while the elasticity of both enables very slight pressure to release the hold and swing back the door.

Claim.—The combination, with the stop C and cushion D, of the bent ribbon-spring E and the loop-spring F, substantially as specified.

135,347.—*Exercising-Machine.*—CHRISTIAN KOLLE, New York, N. Y.

A seat suspended by rods is made to move over a tripping-block by means of revolving arms.

Claim.—The movable detainer *r* applied to and combined with the seats, suspended by the rods *l* and eyes from the arms A of the revolving frame, as and for the purposes specified.

135,348.—*Spring for Watch-Case.*—JACQUES LAURENT, New York, and JULES MENEGAY, Brooklyn, N. Y.

The projecting pointer finger of the spring for throwing open the case is arranged upon the middle part of the hoop-spring instead of being placed at its end.

Claim.—1. The spring for opening the cover of a watch case, composed of an arc or bow, or greater or less portion of a hoop of steel with the lip or tongue *c*, at or near the middle of its length, substantially as herein described.

2. The combination, with the band or hoop-spring having the lip or tongue *c* at or near the middle of its length, of the catch *a* formed at one end of the said spring, substantially as and for the purpose herein described.

135,349.—*Wash-Boiler.*—RALPH LAWYER, Pittsburg, Pa.

A wash-boiler constructed with a flange or projecting ring upon its bottom, (inside,) and with a detachable bottom with a flange or ring projecting downward of sufficient size to inclose the ring located upon its bottom, which projection or ring is perforated. On the upper side of the detachable bottom, at or near its center, is an upright pipe or conductor with a cap to govern the distribution of the water upon the clothing. The water, after passing through the clothing, is returned to be reheated, and again forced by the steam to be again passed through the clothing. On the top of the boiler is a hinged outlet or cover for the escape of steam, and a light of glass is introduced into the frame that the operation of the boiler may be seen through it.

Claim.—1. A wash-boiler constructed with a rim, *a*, on its bottom, as and for the purpose described.

2. The combination of the false bottom B, perforated flange *b*, and ribs C, as described.

3. The combination of the boiler A, rim *a*, false bottom B, flange *b*, and pipe D, as described.

4. In combination with the hinged-lid safety-valve of a wash-boiler cover a window placed in the lid, substantially as and for the purpose described.

135,350.—*Machine for Graining, Pebbling, and Softening Skins and Leather.*—NORMAN O. LOUNSBERRY, Wilmington, Del.

The surface of the leather is brought to the action of the roller B means of a concave apron suspended beneath and attached to crank-wheels, which give to the apron an eccentric motion, causing it to press the leather up to each side of the roller alternately. Motion is imparted to the crank-wheels from the roller-shaft by intermediate gearing.

Claim.—1. In a machine for softening, pebbling, or graining leather, the laterally-moving concave apron D, in combination with the roller B, substantially as specified.

2. The combination of the roller B, gearing C F E, cranks *e*, and concave apron D, substantially as described.

135,351.—*Flow for Unloading Cars.*—JOSEPH MCMULLIN, Casey, Iowa.

Upon the sides of flat cars are secured rails, which project beyond the ends of the cars, forming an endless track for the train; a sliding frame having convex shoes which slide upon the track; and upon the forward beam of the frame is a sliding box, which is attached to the forward part of the plow, that the point of the same may be so adjusted that the plow will throw the load to either side of the track. A sheave, laterally adjusted, is provided at the end of the car so that the power may be applied in a nearly direct line.

Claim.—1. A plow for unloading cars, combined with a guide-frame by which the plow is laterally adjusted, substantially as described.

2. A guide-frame combined with a plow for unloading cars when the plow is laterally adjustable in the same as to its point, so as to throw a greater or less part of the load to either side, substantially as described.

3. The plow D, combined with the sliding frame C and adjustable sheave H, substantially as described.

4. A car constructed with side rails B, projecting at its sides so as to form a continuous track, in combination with the frame C and convex shoes *s s*, substantially as described.

135,352.—*Combined Stop and Check Valve.*—OSCAR E. MCMURRAY, Lansingburg, N. Y.

A stop-cock having a tapering chamber in its plug, said chamber having in it a check-valve and seat, the plug having a screw-cap, whereby the valve may be easily reached. It may be used for a stop-cock or check-valve, as may be desired.

Claim.—The combination, with the case A with inlet and outlet pipes B C, of the plug D with valve seat *a* and the check-valve E, constructed and arranged to rest on said seat, all substantially as set forth.

135,353.—*Brick-Machine.*—JOHN W. METZ, Stout's Post Office, Ohio.

The driving-shaft, situated below the machine, operates the vertical plunger by means of cranks, on each end thereof, connected to pitmen attached to a cross-head, and moves the racked mold-bed by segment-wheels *v v'*, also thereon.

Claim.—The combination in a brick-machine of the low horizontal driving shaft B *b b'*, segment-wheels V V', pitmen G G', and cross-head E, with the hopper M *m'*, vertical plunger L I, traversing-molds T *t* U *u u'*, and mold-guides S *s* S' *s'* above the driving-shaft, all constructed, arranged, and operating substantially as herein described and set forth.

135,354.—*Fire-Escape.*—ENOCH R. MORRISON, Washington, D. C., assignor to himself and JOHN S. STILES, same place.

Claim.—In a fire-escape, the combination of the flat band wound helically upon an arbor, the gear-wheel C, and the worm-wheel D, carrying the radially-expanding friction-governor E E, all arranged within the portable and compact case, substantially as described, said case being adjusted to be attached either to the person or to the building, as specified.

135,355.—*Revolving Sieve.*—ADDIS E. NEAT, New Albany, Ind.

A revolving sieve in which a compound may be pulverized, separated, and sifted.

Claim.—The combination of an exterior and an interior cylindrical sieve, both placed upon a single shaft and revolving with the same, and each provided with one or more interior loose rollers, substantially as herein set forth.

135,356.—*Heating and Cooking Range.*—HENRY L. PALMER, New York, N. Y.—Division A.

By means of the two-way damper C' the smoke-flue A or A' can be used, and thus the products of combustion will be forced up and around the elevated oven, or used to heat the hot-air flue A''.

Claim.—1. A second and alternative draft-flue, A', in an elevated oven-range placed back of the oven and front flue, and arranged to conduct the draft into the chimney independently or without passing around the oven.

2. A center front-flue, A, for leading the draft into the oven-chamber, in combination with a back flue, A', for conducting the draft back of the oven when alternately opened and closed by a two way damper.

3. The double damper C' having its two parts placed at right angles to each other, and operating as described.

4. A front center draft-flue, A, a back draft flue, A', and an air-heating flue, A'', in combination.

5. A back draft-flue, A', provided with a door or opening, *d'*, for access in cleaning the same.

6. A back draft-flue, A', arranged to conduct the draft back of and away from the oven in an elevated oven-range, in combination with a back heating flue or chamber.

7. The combination and arrangement of front center flue A, back draft-flue A', air-heating flue A'', and damper C' with an elevated oven, O, as herein shown.

135,357.—*Gang-Plow.*—SAMUEL E. PARE, Smithville, Ill.

The frame is so constructed that a gang of plows or a stalk-cutter can be attached at pleasure, and to this end the tongue and one clevis are adjustable.

Claim.—The bent axle B, having slot *c*, in combination with the frame A *a' b' c'*, vertical post *d*, adjustable tongue *s'*, and joint C, constructed and arranged so that the beams of a gang-plow or stalk-cutter can be readily attached, substantially in the manner as herein shown and set forth.

135,358.—*Sash-Holder.*—CHARLES PANTELLO, Watertown, N. Y.

The fastening-stud and the thumb-lever for operating it are cast in a single piece, with an offset at right angles to the common plane of them both, and furnished also with securing-pins. The flat steel spring is secured by one end to the offset or space between the stud and the thumb-lever. A small groove around the base of the stud may serve to retain firmly the end of the steel-spring, or an additional rivet may be used for this purpose. This method of securing the spring and the other parts together is to avoid the working loose of the spring and fastening stud, which often happens with springs of the ordinary construction.

Claim.—The sash-fastening consisting of the operating-lever A, locking-pin B, and intermediate plate *t*, cast or formed in one piece, with one or more pins, *g*, and combined with the spring D, substantially in the manner described, for the purpose specified.

135,359.—*Buffer for Sewing-Machines.*—THOMAS G. PERKINS, Chicago, Ill.

The adjustable elbow and plate provide for the lateral and vertical adjustment of the lever that actuates the feed-frame.

Claim.—1. The lever E D F, constructed as described, and combined with the adjustable elbow T, for the purpose of adjusting the lever to the pin *r* to regulate the length of stroke of the feed frame.

2. The lever E D F, constructed as described, combined with the elbow T and adjustable plate W, for setting the lever to the pin *r*, as and for the purpose specified.

135,360.—*Plow-Coupling.*—JAMES K. PITTS, McLean, Ill.

Two half-boxes encircle the horizontal arm of the axle-tree to permit vertical movement, and a pivot permits lateral movement, so that the plow-beams may have both a vertical and lateral movement.

Claim.—The plow coupling shown, consisting of the plates A and A' provided at their forward ends with the cylindrical opening C, and at their rear ends with the semi-spherical bosses *a a* and recess or slot D, connected together by the bolt B, and combined with the tongued bar E and E' by means of the bolt F, substantially as and for the purpose specified.

135,361.—*Saw-Swaging Machine.*—GUSTAVUS A. PRESCOTT, Sandy Hill, N. Y.

A die, on which the saw-tooth rests, and a cam, adjusted in an eccentric thimble, are situated in a movable head to allow its being adjusted to different positions. A follower and screw hold the saw against the swage while being operated upon by the cam.

Claim.—1. A rotating head or other suitable device for holding the dies, so that they can be adjusted to any desired position, as set forth.

2. In a saw-swaging device, the eccentric thimble *j* for adjusting the distance between the dies, as specified.

3. The rotary head F provided with the dies and the thimble *j*, in combination with the frame A and follower B, substantially as set forth.

135,362.—*Corn-Sheller.*—JOHN RANKIN, Binghamton, N. Y.

A yielding sectional concave is supported in an adjustable case. Each section of the rows of sections bears down its succeeding one, as it is depressed by the overlapping or interlocking ends. The sections are held apart by deflectors, so that the corn can pass through and prevent wedging of the cobs and deflect any ears of corn that may enter end first. The peculiar arrangement of the teeth on the cylinder and concave facilitates the egress of the grain separated from the cob.

Claim.—1. A machine constructed with a concave and cylinder, provided with suitable means for separating the grain from the cob, and having combined with the yielding sections of the concave deflectors and retainers *m* for holding apart the sections of the concave and preventing the wedging in of any cob.

2. In combination with the main frame and cylinder, the sectional concave mounted in a case, R, which is adjustable so that it may be set and held with the concave at different distances from the cylinder, as and for the purposes as described.

3. A concave composed of semicircular rows of sections J provided with teeth *f*, and each section of each row overlapping the end of the next section, while all rest on sustaining-springs, substantially as and for the purposes described.

4. The peculiar combined arrangement of the shelling-teeth on the cylinder and concave, as hereinbefore described.

135,363.—*Plow.*—EDWIN REESE, Eutaw, Ala., assignor to CHARLOTTE M. REESE, same place.

The landside is hinged at its point of union with the share, so that its heel can have an angular vertical adjustment. This adjustment is affected by an adjusting-brace pivoted to the heel of the land-side, and secured to the porterior portion of the standard.

Claim.—A bottom-concaved land-side, having the rear section D jointed to a fixed section, E, for the purpose of giving angular adjustment to the rear section of land-side as the bottom of share wears, and thus preserve the cutting-edge of said share always at or about the true angle.

135,364.—*Machine for Breaking Metal Bars.*—WILLIAM RICHTER, Eintrachtshuette, Germany.

The bar is clamped upon the table with the point at which it is to be broken set at the end of the clamp. The projecting end rests upon a block on the end of a crank, which block rises and turns said end to a vertical position. By means of an automatic belt shifting and stopping device the block is returned and the end brought back to a horizontal position, which breaks it, when the machine becomes stopped. The operation can be repeated if necessary, or the rod can be fed along and another break effected at any part desired.

Claim.—1. In a machine for breaking bar-iron, the combination of a hinged breaking-block, F', a bed-plate, G, and the pivoted adjustable block H with its arm I and screw K, these parts operating relatively to each other and to the iron bar essentially as described.

2. The combination of a hinged block, F', a bed-plate, G, a clamp, L, with a cross-bar, *g*, or its equivalent, for holding and breaking off a bar of metal, as set forth.

3. In combination with the breaking-block F', the worm W on shaft U, the segment M with its pins *b b'*, weighted and slotted lever N, lever Q, slide T with its arms S' S', the pulleys V V' V' with one cross and one straight belt, to give the reciprocating rotary motion to the block F', and as an automatic shifting device, essentially as described.

4. In combination with the next above, the lever *v*, catch *z*, shaft *u*, lever *w*, pin *w'*, and arm *y* of the slide T, as an automatic device for arresting the motion of the machine, essentially as described.

5. A machine for breaking bar-iron, the several parts of which are constructed, arranged, and operating essentially as herein described and shown.

135,365.—*Dust-Guard for Car-Windows.*—OBED C. RIFE, North Manchester, Ind., assignor of one-half his right to JOHNSON M. BURDGE, same place.

Dust-guards are attached to stationary plates on either side of a car-window, the guard engaging in notched lugs upon a projecting flange formed on the lower end of the stationary plates; a spring is used to keep the dust-guards down upon said lugs.

Claim.—The combination, with the journal-box D, and spring *d'*, and the base-plate C having the notched lugs *d*, of the dust-excluding wing E having its upper journal passing through the spring-box and attached to spring *d'*, as specified.

135,366.—*Insect-Trap.*—MARK RICKLI, Newton, Ala.

A trap, formed with windows or lights projecting from its sides, constructed to be removed for cleaning. Between these are uprights or divisions with polished surfaces to attract insects, and an enlarged bottom with an upright flange for holding water to receive the insect after death.

Claim.—1. A lantern for insect traps provided with a series of windows arranged therearound, as shown and described, and for the purpose set forth.

2. The vertical plates D, combined with dishes and windows of the lantern, as and for the purpose set forth.

3. The detachable window B, made round or oblong and entirely of glass, as and for the purpose specified.

135,367.—*Turbine Water-Wheel.*—THEODORE H. RISDON and WILLIAM W. TYLER, Mount Holly, N. J.

The buckets of this wheel have their upper edge radial, or nearly so, at the end next the hub, but curved forward outwardly so as to be at the outer end almost a tangent to the periphery of the wheel, the lower edge of said buckets being curved downward outwardly, and the lower portion of the buckets inclosed by an outwardly-flaring band. The water is enabled to enter and issue from the wheel without retarding its velocity whether the gate be fully opened or partly closed.

Claim.—A vertical-discharge wheel, the lower portion of whose buckets is inclosed by an outwardly-flaring band, and in which the lower edge of said buckets is curved downward outwardly, and the upper edge thereof is radial, or nearly so, at its inner end, but curved forward into nearly a tangent to the periphery of the wheel, substantially as shown and described.

135,368.—*Fastening for Rush-Ropes.*—LESTER RUSSELL, Otsego, Mich.

A piece of wire is bent in the center to form nearly a complete ring for clamping around the knotted end of the cord. Before fully completing the ring the ends are bent under forming jaws, while the arms or free ends extend straight upward; the device is then inserted in a recess in the sash, the ring on the inside acting as a spring to force the jaws together, and the arms are driven or otherwise forced up into the sash, thus securely fastening the sash-rope in position.

Claim.—The device or fastening C, made of wire, bent so as to form the ring *d*, jaws *e e*, and arms *h h*, to be inserted in a recess and driven or otherwise forced up into the sash, substantially in the manner and for the purposes herein set forth.

135,369.—*Buffer-Spring for Railroad Cars.*—CYRUS W. SALADEE, St. Catharine's, Canada.

A torsional spring passes through the arm which receives the thrust or the draft of the draw-head and communicates it to the spring.

Claim.—A buffer or coupling for railway cars provided with a torsional spring, substantially as and for the purpose set forth.

135,370.—*Cider-Mill.*—JULES EDOUARD SAUOT, Washington, D. C.

Claim.—1. The combination of a series of circular saws arranged spirally upon the rotating crasher and feeder F and bladed adjustable hopper side H C, substantially as and for the purpose set forth.

2. The described combination of hopper A having the inclined adjustable and channelled side C e I, armed with knives H, and stationary side B, armed with clearers L, which knives and clearers intervene between the consecutive circular saws F separated by washers G, the whole being arranged and operating substantially as and for the purpose set forth.

135,371.—*Ship's Lantern.*—HERBERT SAUNDERS, South Kingston, R. I.

A perforated and vertically-adjustable cap regulates the discharge of the heated air and smoke.

Claim.—1. The vertically-adjustable perforated cap D, in combination with its socket and means for securing it in place, substantially as described.

2. The combination of the cylinders B B', diaphragm C, cap D, and pin E, in a ship's lantern, as described, for the purpose set forth.

135,372.—*Combined Inhaler and Nasal Douche.*—EDWIN SCHOFIELD, Worcester, Mass.

The main receptacle is formed with a flat bottom for resting upon the table. The inlet-tube joins the main receptacle near the bottom; is entirely without it, and is furnished with a bulb for containing a medicament, over which the air is to pass during its ingress. The receptacle and inlet-tube are both formed from one and the same piece of glass. The upper part of the receptacle is fitted with a cork and a draft-tube, which latter is furnished with a nasal-plug. The inhaler may be inverted and serve for a nasal douche.

Claim.—A combined medical inhaler and nasal douche, consisting of the main receptacle A, standard A', inlet-tube C situated entirely without the main receptacle and furnished with a siphon-bulb, E, and the draft-tube B, all as described, and for the purposes set forth.

135,373.—*Purifying and Deodorizing Tallow Obtained in Rendering Offal.*—BENJAMIN F. SHAW, Cambridge, Mass.

To three thousand pounds of scrap on its removal from the digester, three thousand pounds of soup, and all the tallow expelled from the same, add fifteen hundred pounds acid phosphate of lime, nine hundred pounds of water, (preferably mixed with carbon and sulphate of lime;) reduce to gravity of 5° Baumé, mix thoroughly, close the tank, or keep in a room at 100° Fahrenheit. Boil the mass until the tissues are desolved, then allow it to rest, keeping at 140° to 200° Fahrenheit. Remove supernatant fat.

Claim.—1. The use of acid phosphate of lime, alone or in combination with carbon or sulphuric acid, or their salts, or with any other mixture, in the isolation, purification, and deodorization of tallow, fats, oils, or grease, substantially as described.

2. In combination with the use of acid phosphate of lime, alone or in combination with carbon or sulphuric acid, or their salts, or with any other mixture, in the isolation, purification, and deodorization of tallow, fats, oils, or grease, the use of covers to the tallow-isolating or superphosphate tank, for the purpose specified, the maintaining of the fluidity of the surface fat by means of a high temperature, and the maintaining in the gelatine or watery

mass the light gravity or thinness required, all substantially as described.

135,374.—*Wash-Boiler.*—ANTHONY SLUTHOUR, New Philadelphia, Ohio.

An ordinary wash-boiler has a tube connected with the cover, a drip-pipe and cup, detachable inner sides, a movable bottom with a dividing-rib and steam-trap.

Claim.—1. In combination with the boiler A and cover F, provided with the opening *f* and tube *f'*, the pipe H and cup I, substantially as and for the purpose shown.

2. The detachable inner sides or walls B, when constructed separate, as shown, and combined with the boiler A by means of the wings B' and flanges *b'*, substantially as and for the purpose set forth.

3. The false or movable bottom D, constructed in the form seen, and combined with the boiler A and false sides B, substantially as and for the purpose shown and described.

4. The combined dividing-rib and steam-trap E, constructed as shown, and combined with the false bottom D, substantially as and for the purpose specified.

5. The hereinbefore-described device as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose set forth.

135,375.—*Glass Button.*—ALBERT M. SMITH, Brooklyn, N. Y.

A glass button, while the glass is in a plastic state, is pressed into a backing of wire-cloth. The shank is secured between the wire and glass, and extends nearly to the periphery of the button on both sides.

Claim.—As an improved article of manufacture, a glass button having a back of wire-cloth, perforated or corrugated metal, and a flat shank, both embedded in it by pressure when in a hot plastic condition, thus strengthening the glass and supporting the shank.

135,376.—*Duster.*—GAWN M. SMITH, Louisville, Ky.

A duster composed of a body of fine fiber, with a stiffening of feathers or other material.

Claim.—The new article of manufacture of a duster, composed of a body of fine fiber, A, with stiffening B, and provided with a handle, D, substantially as and for the purpose herein specified.

135,377.—*Revolving Fire-Arm.*—OTIS A. SMITH, Middlefield, Conn..—Case A.

The head or finger-piece is forced into a notch by a spring-stud so as to secure the same in place, and be readily removable for detaching the cylinder; also, the combination of a lifting-arm or pawl with the hammer, a loose pin and the spring-cylinder stop, for raising said stop before the cylinder begins its rotary movement.

Claim.—1. In a revolving fire-arm, the center-pin, provided with the finger-piece F working between the arm E and the barrel, the said arm E formed with a notch, *a*, and having a spring-stud, *d*, to force and hold the said finger-piece into the said notch, substantially as described.

2. In combination with the cylinder C, stop G, and hammer D of a revolving fire-arm, the latch *n* and the slide *f*, constructed and arranged to operate substantially as set forth.

135,378.—*Revolving Fire-Arm.*—OTIS A. SMITH, Middlefield, Conn.—B.

A central spindle and an auxiliary spindle are arranged within the hollow extractor-arm so that the central spindle may readily be withdrawn as desired, and in combination with the above a spring-catch for securing the parts in place.

Claim.—1. In combination with the barrel A, cylinder B, and arm C, the spindles *a* and E, the said spindle *a* arranged axially within the said arm C, and so as to engage the spindle E, substantially as and for the purpose described.

2. In combination with the subject-matter of the first clause of claim, the notch *f* in the arm C, the projection *d*, and the spring *n*, substantially as and for the purpose described.

135,379.—*Bustle.*—TIMOTHY S. STRRAT, New York, N. Y.

The stays of the bustle are each formed of one continuous piece of wire. At the stem portion, which rests upon the body of the wearer, the wire is double, and at the waistband it is coiled into a spring and then radiates in a curve from the waistband, holding the bows of the bustle in eyelets formed by a single coil at different points on its length.

Claim.—1. In a lady's bustle or skirt, the combination therewith of a web-support having an extension-stay, D, a holding-stem or stems, F, and a coil-spring brace, E, essentially as and for the purpose set forth.

2. A bustle-spring having its web-stay or stays D, holding-stem or stems F, and coiled-spring brace or braces E of a single strand of spring-wire, as described.

3. The web stays or supports having a series of eyes, *c*, formed as described, and for the purpose set forth.

4. In a bustle spring, constructed as described, the coil-spring brace E, located and arranged as described, to serve as a spring-hinge for the web, as described.

5. The clamp I for the holding stem pockets H, arranged contiguous to the coil-spring hinge E to resist the recoiling-force of the latter, as described.

135,380.—*Mode of Adjusting the Length of Pitmen.*—NORMAN C. STILES, Middletown, Conn., assignor to THE STILES & PARKER PRESS COMPANY, same place.

Claim.—The herein-described mechanical adjustment for pitmen or connecting-rods, consisting of the eccentric B, toothed upon its periphery, arranged in one end of the pitman and combined with the pinion D, the axis of which pinion is parallel with the axis of the eccentric and provided with set-screws E, or other suitable clamping device acting directly upon the eccentric independent of the pinion, substantially as set forth.

135,381.—*Binder for Sewing-Machines.*—MARSHALL J. STOLL, Middletown, Conn.

The outer end of the folding device is secured to the outer end of the spring in order that the folder may readily adapt itself to any thickness of material, and the projecting forward end of the folder is steadied between the foot and spring and forms a guide for the folded material quite up to the needle.

Claim.—The folding device D attached at or near its receiving end to the spring C, and provided with a lip, F, extending forward between the presser-foot and the spring C, all constructed and operating as described.

135,382.—*Self-Waiting Table.*—MELVIN STONE, Vermillion, Ohio.

A central shaft, on which revolve two tables that are separated from each other by conoidal hubs. The tables are provided with cruet-stands and with knobs for revolving the tables.

Claim.—The improved dining-table stand, consisting of the shaft A, revolving tables B B', having the conoidal hubs E E,' and provided, respectively, with the cruet-stands G and knobs F, substantially as specified.

135,383.—*Treating Offal and Manufacturing Fertilizers.*—JACOB J. S. ORER, Boston, Mass.

The offal is placed in a revolving cylinder and the flame passed directly over it.

Claim.—1. The process and apparatus, substantially as and for the purpose described.

2. The drying of offal, blood, or other animal matter in a cylinder, for the purpose of preparing it for a fertilizer, by passing flame and products of combustion through the cylinder only, not around or outside of it, directly over or in contact with said material, substantially as and for the purposes described.

3. In combination with the cylinder and fire-place, with or without the use of pulverized fuel, the gas and flame mingling and combustion chamber and the concave bottom of said chamber, substantially as and for the purposes described.

4. The production of a fertilizer from offal, blood, and other animal matter by drying it, and from tank-water by evaporating it, by the direct contact or radiation of flame or the products of combustion of solid or pulverized fuel, gases, or steam, substantially as described.

5. The drying of offal, blood, or other animal matter in a cylinder, for the purpose of preparing it for a fertilizer, by passing the flame of pulverized fuel and other products of combustion through the cylinder directly over or in contact with said material, substantially as and for the purposes described.

135,384.—*Printer's Lead-Casting Machine.*—JOHN I. STURGIS, Milwaukee, Wis.

The parts of the mold are supported by a hinged frame clamped together by a screw. A lever is provided to "jerk" the mold and settle the metal in casting thin leads, and a lamp is provided to heat the lower extremity of the mold and prevent too sudden cooling.

Claim.—1. Molds D and arms C, in combination with lever E, substantially as and for the purpose described.

2. Molds D, hung as specified, in combination with lamp F, substantially as and for the purpose set forth.

135,385.—*Rudder for Vessels.*—OLIVER P. THARP, Cincinnati, Ohio.

The stern-post of the vessel has a metallic frame-work securely fastened to its upper end, and the weight of the rudder is adjustably supported on this framing by a set-screw and nut. The rudder is confined below to the rudder-post by the ordinary bolts and gudgeons or hinges, which allow it to have its usual lateral play.

Claim.—The supporting-arm F, clip H, and screw or pin *h'*, in combination with a bolt-shipped rudder, substantially as specified.

135,386.—*Car-Axle Lubricator.*—THEODORE R. TIMBY, Tarrytown, N. Y.

Claim.—The bottomless crib, constructed as herein described, adapting it to be applied to an axle-box of common form and to hold a body of capillary material in contact with the journal, as explained.

135,387.—*Car-Coupling.*—WILLIAM TODD, Portland, Me.

The coupling-hook is recessed just back of its beak and a plate extends across the draw-head, which plate partly fills this recess. When the forward end of the link falls the rear end is received against the plate instead of the hook. The bumper and draw-head are so arranged in relation to each other that the concussion occasioned by the meeting of the cars is equally distributed between the draw-head and the bumper.

Claim.—1. The plate *f*, when used in a car-coupling having a horizontal hook, in the manner and for the purposes as set forth.

2. The combination of the draw-head having the recesses *m m*, the straps K K, collar *j*, block *i*, and buffers *q' q'*, as set forth.

135,388.—*Casting Centers on Cast-Iron Screws.*—THEODORE M. TUCKER, Newark, N. J.

Conical centers are cast on the ends of the screw-blank or other article to be turned, which centers are received into corresponding recessed centers in a lathe in which it is to be turned.

Claim.—The male centers B B cast on a chair-screw or other cast article requiring to be turned between lathe-centers, substantially as and for the purpose herein set forth.

135,389.—*Frame for Pillow-Spreads.*—PETER W. VAN EST, Rochester, N. Y.

An oblong frame covered with soft flexible pads on each corner and provided with buttons or knobs to attach the spread to.

Claim.—The frame B, provided with the pads *a a* and buttons *b b*, or their equivalents, and used either with or without the cross-rod B², constructed substantially in the manner and for the purpose specified.

135,390.—*Furnace-Grate.*—THEODOR VON BOLZANO, Schlan, Kingdom of Bohemia, Austria.

A feed-box has a grate with two inclined tiers, and one horizontal with levers whereby the alternate bars of the inclined tiers are shaken, the coal being transferred from one tier to the other by the shaking of the bars, and is more particularly designed for burning fine coal. The box is hung and swings on trunnions, thereby feeding the furnace without admitting cold air.

Claim.—1. The feed-box D swinging on gudgeons *m*, and abutting against the plates E F, in combination with a grate, A B C, constructed and operating substantially in the manner herein set forth.

2. The arrangement of transverse rods *g*, which are actuated by a hand-lever, and engage with the alternate grate-bars, substantially in the manner described.

3. The grates A B C, each constructed and arranged in respect to each other, as herein shown and described, in combination with the openings *o' o²*, and levers *i* and *j*, and transverse rods *k* and *g*, substantially as set forth.

135,391.—*Funnel.*—CHARLES G. WAY, Boston, Mass.

A funnel composed of flexible material and having an exteriorly and interiorly corrugated spout.

Claim.—The new article of manufacture herein described and shown, the same consisting of a flexible funnel having a corrugated spout, and made of India rubber in any of its elastic compounds.

135,392.—*Sewing-Machine Table Top.*—WILLIAM WILSON, Madison, Ind.

A supplementary table-top extending on all sides outside of the permanent top, and supported solely by a projecting molding formed on the outer edge of the permanent table-top.

Claim.—A removable supplementary top for sewing-machine tables, when the said top B is supported solely by a projecting molding on the outer edge of the permanent table-top A, substantially as shown and described, and for the purpose set forth.

135,393.—*Device for Adjusting Millstones.*—ALEXANDER W. WINALL, Cincinnati, Ohio.

The bridge-tree is suspended and rendered simultaneously adjustable at each end, insuring true parallelism of the runner.

Claim.—1. In a grinding-mill, a bridge-tree suspended at or by its ends, and the same made simultaneously adjustable toward or from the millstones, substantially as and for the purpose specified.

2. In combination with the bridge-tree K, the threaded rods M, nuts N, bevel-pinions O and O', and the shaft P, substantially as and for the purpose shown.

135,394.—*Harvester.*—CHARLES M. YOUNG, Meadville, Pa.

The main frame is adapted to receive two coupling-frames, by means of which the cutting apparatus may be arranged in front, at the center, or in rear of the main frame.

Claim.—1. The main frame provided with its points of attachment A^2 *a a'* for the reversible coupling and brace-arms D G, in combination with the extension-axle B' as a point of attachment for the coupling-arm D', and the interchangeable tongue-sockets F F', as described, whereby the machine is adapted to be used with a front cut in mowing, and with either a center or rear cut for reaping, as described.

2. The combination of the rock-shaft E with the removable coupling-arm D', for adapting the sickle to be operated in a center cut by the same gearing and connecting-rod or pitman by which it is operated in a front or rear cut, as described.

3. The combination of the swiveled leading-wheel H with the forward extended end of the pivoted brace G, substantially as described.

4. The combination of the two bevel-pinions J^1 J^2 of different diameters on the crank-shaft with a bevel driving-wheel, the face of which is set obliquely to the line of said crank-shaft crossing the same, substantially as and for the purpose set forth.

5. The double or reversible V-shaped pawls L and adjusting-block M and springs, in combination with the recessed hubs of the driving-wheels and the reversible tongue for reversing the direction of rotation of the driving-wheels, as described.

6. The lifting segment and lever provided with the sliding yielding bolt and spring, and connected with the coupling-arm, substantially as described, for relieving the drag of the cutting apparatus on the ground when the lifting-lever is locked.

REISSUE PATENTS.

5,255.—*Ore-Washing Apparatus for Hydraulic Mining.*—JOSEPH M. ALLENWOOD, Timbuctoo, Cal., assignor to RANDOLPH R. CRAIG and JOSEPH CRAIG.—Patent No. 43,468, dated July 12, 1864.

Claim.—1. The combination of a discharge-pipe provided with guides or diaphragms, and the elbow C, connected by a working-joint with the supply-pipe A, substantially as and for the purpose above specified.

2. The combination of two elbows, C A, with the swiveling-joint D, substantially as and for the purposes above described.

3. The combination of the two working joints or couplings, D and E, with the discharge-pipe N and supply-pipe A, by means of which both the horizontal and vertical motions are obtained, substantially as and for the purposes specified.

4. The combination of the parts set forth in the accompanying specification, constituting a new and improved machine for the uses and purposes above described.

5,256.—*Cheese-Press.*—GEORGE B. BOOMER, Syracuse, N. Y., THOMAS G. MORSE, Erie, Pa, and RUFUS E. BOSCHERT, Syracuse, N. Y.; said MORSE assignor to said BOOMER.—Patent No. 108,753, dated November 1, 1870.

Claim.—In combination with the sliding standards, supported laterally and guided in the frame of the press, the double screw-shaft supported in or against the sliding standards, substantially as and for the purpose described.

5,257.—*Dies for Forming Sheet-Metal Ware.*—MELLEN BRAY Newton, Mass.—Patent No. 133,919, dated December 17, 1872.

Claim.—1. The combination of a cylindrical male-forming die, a female-forming die, having a cylindrical bore and a plane-holding surface, as described, and a holding-die which surrounds the male die, and has its holding-surface parallel to the holding-surface of the female die, and is suitably held to the same so as to gripe the metal plate between them, as described, all constructed and operated substantially as described.

2. The combination, with the said male and female forming-dies and the holding-surfaces of the spring-fingers, or their equivalent, for removing the article formed from the male die, substantially as described.

5,258.—*Governor for Steam-Engines.*—GEORGE W. CLARK, Council Bluffs, Iowa.—Patent No. 120,856, dated November 14, 1871.

Claim.—1. The combination of a governor-lever, M, a piston, D, and devices connecting the same, the piston being subject to the action of the live steam, and the said connecting devices arranged to operate the lever M as the steam-pressure varies and the piston rises or falls, substantially as and for the purposes herein set forth.

2. The combination of the steam-chest B, flexible cover C, piston D, lever E, spring S, link R, and lever M, all substantially as and for the purposes herein set forth.

3. The combination of a shifting re-enforcing weight, P, a piston, D, and connecting devices therefor, with a governor-lever, M, the piston being subject to the action of the live steam, and the said connecting devices being arranged to cause the weight to shift along the said lever as the steam-pressure varies and the piston rises or falls, all substantially as specified.

4. The combination and arrangement of the piston D, lever E, elbow-lever H, notched bar L, weight P, governor-lever M, and springs S, all substantially as specified.

5,259.—*Lady's Collar and Cuff.*—WILLIAM E. LOCKWOOD, Philadelphia, Pa.—Patent No. 33,771, dated April 26, 1862; reissue No. 1,960, dated June 6, 1865.

A compound fabric of paper and muslin has its paper face embossed in imitation of the figure and fiber of a woven fabric.

Claim.—A collar having a paper surface imitative of the textile face and fiber of a dressed linen collar, as set forth.

5,260.—*Sewing-Machine.*—GEORGE RENFUSS, Philadelphia, Pa., assignor to AMERICAN BUTTON-HOLE, OVERSEAMING, AND SEWING MACHINE COMPANY.—Patent No. 51,066, dated November 21, 1865; antedated November 11, 1865.

For working button-holes the adjustable plate which supports the lever that carries needle *s* is moved into operative position, and the thread carried by this needle beyond the edge of the fabric, is caught by the hook on the rotary-reciprocating sleeve, and laid in loop-form under the vertically-reciprocating needle. For plain sewing with needle and shuttle, the lever is turned aside, and the cam-wheel on the driving-shaft is moved forward and receives within its groove the pin projecting from the arm connected with the shuttle-carrier, which has been turned up in operative position. When the lock-stitch is being made a plate, which is pivoted to the head of the machine and which enters the annular groove in the sleeve, is disengaged from such sleeve, and the latter is connected to and reciprocates with the needle-bar, but does not turn as when button-holes are being worked.

Claim.—1. The lever K and its needle *s* carrying a loop of thread across the edge of the fabric, when the said lever is so connected to a permanent part of the machine as to be adjustable, substantially in the manner and for the purpose specified.

2. The combination of the shuttle-carrier O, the cam-wheel S', and arm Q', the whole being constructed and arranged for adjustment, substantially as and for the purpose herein set forth.

3. The sleeve E, adapted to the needle-bar and to the stationary arm B in the manner described, in combination with the devices herein set forth, or their equivalents, whereby the said sleeve may be put in or out of action, as desired.

4. The take-up mechanism, consisting of the adjustable pin *i* on the needle-arm D, the lever G and its arm *k*, and tension device 3, the whole being arranged and operating substantially as and for the purpose herein set forth.

5,261.—*Clothes-Wringer.*—AUGUST ALBRECHT, Philadelphia, Pa., assignor, by mesne assignments, to AMERICAN MACHINE COMPANY.—Patent No. 112,669, dated March 14, 1871.

A clothes-wringer with its frame constructed with a standard and curved top holding the journals of the upper roll, and forming the projecting legs for attaching it to the tub, and on which rests the rubber springs, and with a standard on its opposite side, with journals, from which the lever holding the lower roll is held,

which rests on the springs and is connected with the journals of the standard by hooks, which regulate the tension of the rolls. The standards are constructed with projections to give them tenacity.

Claim.—1. A clothes-wringer in which are combined, substantially in the manner described, levers D carrying the roller G, and a spring, E, situated between the fulcrum of each lever and the said roller.

2. The combination described, of the projections *m* of the frames and their bearings for the upper roller, with the levers D carrying the lower roller.

3. The combination of the frame A and its fulcrum *f* with the lever D, having a hooked end, *h*, all substantially as specified.

5,262.—*Clamping Movable Seat for Carriages.*—SYLVESTER W. BEACH, Ypsilanti, Mich., assignor to BEACH PATENT SHIFTING CARRIAGE-SEAT MANUFACTURING COMPANY.—Patent No. 109,103, dated November 8, 1870.

The seat is seat is secured to ways which are attached to the inner sides of the body by means of clamping-guides, these being moved vertically by means of a cam which has its bearing upon the bottom of the seat.

Claim.—1. The clamping-guides *g'*, operated by the cam *h*, substantially for the purposes set forth.

2. In connection with the clamping-guides *g'* and plate *d*, the cam *h*, for the purposes specified.

3. In connection with the clamping-guides *g'* and plate *d* and cam *h* the bale *m*, substantially as described, and for the purposes described.

4. The combination of the bale *m*, the clamping-guides *g'*, the ways *c*, the guides *g*, and the wheels *s*, when constructed and arranged substantially as and for the purposes set forth.

5,263.—*Lifting-Jack.*—JOHN D. OTSTOT, Springfield, Ohio.—Patent No. 133,949, dated December 17, 1872.

Claim.—1. The combination of the lifting-lever G and its lifting-pawl D, when said lever is pivoted by trunnions thereon working in open bearings upon the stock A, as and for the purpose described and represented.

2. In combination with the lifting-pawl D, the lateral projections *i* upon its head and the recessed ways *j* in the flanges of the stock, as and for the purpose described.

3. In combination with the lifting-lever G and the holding-pawl E, the projection *r* upon the latter, so that it may be struck by said lever to throw said pawl out of action with the lifting-bar, as and for the purpose described.

4. The combination and arrangement of the stock, lifting-bar and its cap, and lifting-lever and its lifting-pawl, whereby the bar cannot be removed without first removing the cap, and the lifting-lever and its pawl cannot be removed without first removing the lifting-bar, as and for the purpose described and represented.

5. In combination with the lifting-lever G and lifting-pawl D, the guides or ways *v*, by which, when the lever is thrown up to release the holding-pawl, the lifting-pawl will be drawn out of action also, as described and represented.

5,264.—*Wheel for Vehicles.*—ALBERT L. BLACKMAN, Cross Plains, Tenn., assignor of part interest to SAMUEL K. SCHWENK and JOHN E. SAUNDERS.—Patent No. 127,300, dated May 28, 1872.

The wheel can be made straight without any dish, the spokes can be replaced without injury to the hub or rim, and the tire can be tightened without cutting.

Claim.—1. The combination of cast cylinder A having the concave-shaped flanged B on its inner end, and axle-bearings *a a'*, the adjustable concave flange C in their respective forms, or mechanical equivalents, the whole constructed and arranged substantially as and for purposes set forth.

2. Cast cylinder A with its mortised or recessed concave flange D, mortised or recessed concave flange or disk E, confining-screw F, in combination with the spokes, bread based or dovetailed one way and wedge-shaped the other, in their respective forms, or mechanical equivalents, the whole constructed and arranged substantially as and for purposes set forth.

3. The combination of the cast cylinder A having the concave recessed flange D, the adjustable concave recessed flange E, the flange-nut or confining-screw F, in their respective forms, or mechanical equivalents, with or without the removable axle-bearings *a a'*, the whole constructed and arranged substantially as and for the purposes set forth.

4. The vehicle-wheel hub complete, having either form of flange, spokes G in their trapezoidal or wedge-shaped form one way, and dovetailed form the other, with or without removable axle-bearings *a a'*, thimble-screw tenon *e*, and the mitered or obliquely-cut and matched felly-joint *f*, the whole constructed and arranged substantially as described, and for the purposes set forth.

INDEX OF INVENTIONS PATENTED JANUARY 28, 1873.

[The numbers in parentheses denote the classification of patents.]

Animals, machine for cutting food for, (39,) R. Fanslau ... 135,326
Artist's scraper, (54,) H. J. Haight ... 135,333
Bedstead fastening, (92,) J. F. Mancha ... 135,279
Bench, carpenter's, (39,) J. Jones ... 135,342
Boiler, wash, (136,) R. Lawyer ... 135,349
Boiler, wash, (136,) A. Slutbour ... 135,374
Boiler attachment, wash, (134,) Jeffers and Bockoven ... 135,225
Boot and shoe heels, machine for burnishing, (16,) J. Beasley ... 135,259
Boot and shoe soles, machine for burnishing and trimming the edges of, (16,) J. W. Maloy ... 135,229
Bottle stopper, (1,) D. M. Cumings ... 135,267
Brewing beer and ale, (19,) L. Pasteur ... 135,345
Brick machine, (30,) J. W. Metz ... 135,353
Buckle, breeching loop, (23,) J. H. McGarrah ... 135,336
Bullet mold, revolving, (33,) J. Bradford ... 135,197
Bunga, machine for making, (175,) R. Boeklen ... 135,378
Bustle, (30,) T. S. Sperry ... 135,379
Butter printing machine, (45,) D. E. Dutrow ... 135,323
Button, glass, (23,) A. M. Smith ... 135,375
Car coupling, (122,) D. Bradford ... 135,316
Car coupling, (122,) W. Todd ... 135,387
Car coupling, (122,) S. H. Zink ... 135,255
Car coupling attachment, (122,) Brown and Jedkins ... 135,269
Car starter, (122,) P. Bates, Jr ... 135,193
Car, street, (121,) W. T. Jenks ... 135,277
Car brake, railway, (122,) J. F. Elder ... 135,212
Car axle box, (87,) J. Kinzer ... 135,343
Car axle boxes, alarm and lubricating device for, (122,) O. Evans ... 135,213
Car axle lubricator, (122,) T. R. Timby ... 135,386
Car windows, dust gear for, (122,) O. C. Rife ... 135,365
Cars, plow for unloading, (121,) J. McMullin ... 135,351
Cars, buffer spring for railroad, (122,) C. W. Saladee ... 135,369
Card rack, (146,) J. J. Gray ... 135,272
Carriage, (31,) T. B. Patten ... 135,267
Carriage wheels to their axles, securing, (31,) Fischer and Bruhn ... 135,327
Carriages, clamping movable seat for, (31,) S. W. Beach, (reissue) ... 5,262
Cart saddles, back chain for, (72,) W. B. McClure ... 135,235
Caster, furniture, (24,) J. Parry ... 135,286
Chair fan, rocking, (165,) Nissle and Schöberl ... 135,282
Churn, rotary, (45,) W. McClure ... 135,281
Cigar fillers, machine for pressing and shaping, (100,) C. H. Palmer ... 135,343
Clothes wringer, (91,) A. Albrecht, (reissue) ... 5,261
Clothes wringer, (91,) T. E. McDonald ... 135,237
Collar and cuff, ladies', (109,) W. E. Lockwood, (reissue) ... 5,259
Corn coverer, (43,) J. Tweedy ... 135,301
Corn sheller, (58,) A. Adams ... 135,306
Corn sheller, (58,) J. Rankin ... 135,362
Cooler, milk, (45,) F. S. Oakes ... 135,284
Corpse cooler, (39,) E. S. Earley ... 135,210
Cultivator, (43,) Colver and Priest ... 135,364
Die plate, (14,) F. D. Bliss ... 135,314
Digger, potato, (114,) H. G. Barrows ... 135,307
Door button, (24,) O. F. Fogelstrand ... 135,215
Door check, (24,) J. and A. Kolb ... 135,346
Drilling machine, (100,) P. Blaisdell ... 135,313
Duster, (92,) G. M. Smith ... 135,376
Engine, rotary, (150,) J. C. Culver ... 135,307
Engine, rotary steam, (150,) J. B. Bennett ... 135,311
Engine, compound steam, (150,) L. Huntoon ... 135,223
Engines, governor for steam, (69,) G. W. Clark, (reissue) ... 5,258
Exercising machine, (143,) C. Kolle ... 135,347
Filter, (167,) P. Huerne ... 135,222
Fire escape, (30,) E. R. Morrison ... 135,354
Fire kindler, (154,) J. Y. Marks ... 135,280
Fire arm, revolving, (132,) O. A. Smith ... 135,377, 135,378
Flower pot, (63,) M. B. Gould ... 135,271
Food, article of, (58,) G. G. Campbell ... 135,304
Funnel, (167,) C. G. Way ... 135,391
Furnace grate, (154,) T. Von Bolsano ... 135,390
Furnace, hot air, (154,) H. N. Longfellow ... 135,227
Furnace for burning coal dust, small fuel, &c., (154,) J. Tissot ... 135,298
Gage, diamond, (68,) W. Shapard ... 135,249
Gear cutting machine, (100,) J. J. Greenough ... 135,318
Generator, steam, (150,) T. Harang ... 135,219
Generator, steam, (150,) A. R. McDonald ... 135,236
Gun lock, safety, (53,) D. H. Mapother ... 135,233
Harvester, (74,) C. M. Young ... 135,394
Heater, railroad car, (121,) Michaels and Broadwell ... 135,239
Heater, base burning fire place, (154,) W. Magill ... 135,278
Hook, security, (53,) J. K. Macdonald ... 135,228
Hook, snap, (23,) W. W. Kitch ... 135,344
Horse power, (159,) A. G. Hagerstrom ... 135,331
Horses, safety check for, (72,) J. W. Domett ... 135,208
Hose bridge, (120,) Orr and Gildersleeve ... 135,285
Inhaler and nasal douche, combined, (156,) E. Schofield ... 135,372
Inkstand, (146,) Thurston and West ... 135,296
Iron and bolder, smoothing and fluting, (38,) J. Hewitt ... 135,335
Jack, lifting, (79,) J. D. Otstot, (reissue) ... 5,263
Jug or pitcher, molasses, (88,) M. J. Bennett ... 135,260
Lamp wicks, treating, (90,) St. C. F. Sutherland ... 135,252
Lantern, ship's, (90,) H. Saunders ... 135,371
Leather cutting machine, (92,) R. Crocker ... 135,266
Leather dressing compound, (69,) F. G. Bell ... 135,310
Lock nut, (14,) W. H. Nichols ... 135,242
Lock, sash, (24,) C. T. Gibson ... 135,217
Locomotive, traction, (94,) T. S. Minnias ... 135,240
Loom picker, (95,) W. Taylor ... 135,253
Lumber chute, (92,) Van Name and Wakefield ... 135,302
Meat chopper, (25,) J. Battey ... 135,258
Metal bars, machine for breaking, (119,) W. Richter ... 135,364
Mill, cider, (19,) J. E. Sauné ... 135,370
Mill stones, adjusting, (57,) A. W. Winall ... 135,393
Mortising machine, (173,) L. Houston ... 135,337
Movement, mechanical, (67,) C. W. Carr ... 135,263
Movement for converting oscillating into rotary motion, mechanical, (67,) J. Peabody ... 135,288
Music leaf turner, (103,) G. Dominy ... 135,322
Nail separating machine, (103,) B. Beveiander ... 135,312
Nails, machine for selecting and delivering, (103,) A. Knowlton ... 135,345

Oakum, machine for twisting, (127,) L. and C. Howard ... 135,336
Offal, apparatus for treating, (99,) A. Edwards ... 135,294
Offal and manufacturing fertilizers, treating, (94,) J. J. Storer ... 135,383
Ore washing apparatus for hydraulic mining, (3,) J. M. Allenwood, (reissue) ... 5,255
Ozone, apparatus for making, (66,) C. H. Johnson ... 135,226
Paper bag machine, (100,) T. Hotchkiss ... 135,275
Pillow spreads, frame for, (38,) P. W. Van Est ... 135,389
Pitmen, adjusting the length of, (67,) N. C. Stiles ... 135,360
Plane for scraping, (39,) J. Jones ... 135,341
Plane, shoemaker's edge, (16,) F. F. Baumann ... 135,308
Planing machines, feed roll for, (130,) S. Laman ... 135,224
Planter, cotton, (133,) W. E. Rhodes ... 135,290
Planter, hand, (133,) S. S. Stults ... 135,294
Plow, (114,) J. W. Reed ... 135,289
Plow, (114,) R. Reese ... 135,363
Plow coupling, (114,) J. K. Pitts ... 135,360
Plow gang, (114,) S. E. Parr ... 135,357
Power, transmitting motive, (67,) R. T. Smith ... 135,293
Press, cheese, (45,) Broomer, Morse and Boschert, (reissue) ... 5,256
Press, glass, (68,) A. M. Smith ... 135,292
Press, hay and cotton, (7,) P. A. Shearer ... 135,291
Printer's lead casting machine, (164,) J. S. Sturgis ... 135,384
Propeller for vessels, vibrating, (130,) D. Bainbridge ... 135,257
Pump handle, (118,) I. N. Fraser ... 135,309
Pump, steam vacuum, (118,) W. Burdon ... 135,198
Pump, steam vacuum, (118,) W. Burdon ... 135,199
Pump, steam vacuum, (118,) W. Burdon ... 135,300
Pump, steam vacuum, (118,) W. Burdon ... 135,301
Pump, steam vacuum, (118,) W. Burdon ... 135,303
Pump operated by exhaust steam, steam vacuum, (118,) W. Burdon ... 135,303
Railroad chair, (120,) E. D. Mann ... 135,230
Railroad track, (120,) D. S. Tuthill ... 135,300
Rake, horse hay, (77,) C. N. Goss ... 135,330
Rake and tedder, horse, (77,) G. L. Ives ... 135,276
Range, heating and cooking, (154,) H. L. Palmer ... 135,356
Reel, angling, (143,) C. L. Noe ... 135,283
Register, counting, (67,) R. P. Hinds ... 135,336
Refrigerator, (58,) E. S. Earley ... 135,209
Refrigerator, (58,) A. B. Spencer ... 135,251
Rudder for vessels, (137,) O. P. Tharp ... 135,385
Sad iron, (91,) W. A. Freeman, Jr ... 135,328
Sash balance, (24,) B. F. Hartman ... 135,221
Sash holder, (24,) C. Partello ... 135,358
Sash rope fastening, (24,) L. Russell ... 135,368
Satchel, school, (162,) H. Wallis ... 135,254
Saw swaging machine, (131,) G. A. Prescott ... 135,361
Saw sharpening machine, gin, (131,) J. M. Bailey ... 135,256
Sawing machine, wood, (130,) S. Funck ... 135,216
Sawing and splitting wood, machine for, (130,) A. G. Hagerstrom ... 135,332
Screw driver, (29,) F. B. Hunt ... 135,340
Screws, casting centers on cast iron, (33,) T. M. Tucker ... 135,388
Sewing machine, (134,) A. Bingham ... 135,194
Sewing machine, (134,) G. Rehfuss, (reissue) ... 5,260
Sewing machine binder, (134,) M. J. Stoll ... 135,381
Sewing machine lock, (134,) E. L. Gaylord ... 135,270
Sewing machine ruffler, (134,) T. G. Perkins ... 135,359
Sewing machine table top, (134,) W. Wilson ... 135,392
Sewing machines, clutch mechanism for treadles for, (67,) J. Tisdale ... 135,297
Sheet metal ware, die for forming, (136,) M. Bray, (reissue) ... 5,257
Shutter fastener, (24,) N. H. Byerley ... 135,319
Shutter, metallic, (29,) W. H. Rodden ... 135,246
Sleve, revolving, (170,) A. E. Neat ... 135,355
Skins and leather, machine for graining, pebbling, and softening, (92,) N. O. Lounsberry ... 135,350
Slate frame, transparent, (146,) W. F. Boucher ... 135,315
Spindles, bearings for, (67,) Taylor and Prest ... 135,295
Spittoon, (63,) E. Mather ... 135,234
Stove, cooking, (154,) M. G. Fagan ... 135,325
Stove, cooking, (154,) W. A. Greene ... 135,273
Stoves, device for feeding, (154,) B. Connelly ... 135,265
Table, extension, (62,) M. Hofman ... 135,274
Table, ironing, (91,) A. Wechaler ... 135,303
Table, self-waiting, (62,) M. Stone ... 135,382
Tacks, machine for separating and delivering, (103,) C. W. Glidden ... 135,339
Tacks, nails, &c., metal coating, (113,) C. D. Hunt ... 135,339
Tallow obtained in rendering offal, purifying and deodorizing, (26,) B. F. Shaw ... 135,373
Tan bark, apparatus for expressing liquid from spent, (35,) L. Breval ... 135,317
Tanning hides, (92,) A. Fleischhauer ... 135,214
Telegraph insulator, (50,) N. Hendricks ... 135,334
Tilting machine, (143,) G. J. Smale ... 135,250
Tobacco topper, (44,) Ackley and Ranney ... 135,305
Trap, animal, (143,) F. Flora ... 135,268
Trap, insect, (63,) M. Rigell ... 135,288
Truck, (31,) Chisholm and Mayer ... 135,305
Truck, (31,) M. L. Senderling ... 135,247
Truck, barrel, (31,) V. Bell ... 135,309
Tug fastening, (23,) J. Turley ... 135,299
Turn table, (120,) W. Wharton, Jr ... 135,304
Umbrellas, manufacture of runners and top notches for, (165,) Cox and Holland ... 135,321
Valve, duplex safety, (152,) T. Harang ... 135,220
Valve, combined stop and check, (152,) O. E. McMurray ... 135,232
Vat, tan, (92,) C. H. Manning ... 135,231, 135,233
Vehicle wheel, (31,) A. L. Blackman, (reissue) ... 5,264
Vehicle wheel, (31,) N. Palmer ... 135,244
Vent, (40,) O. S. Camp ... 135,330
Wagon, dumping, (31,) P. Bodley ... 135,195
Wash basins, waste trap for, (91,) H. H. Craigie ... 135,206
Washing machine, (91,) S. Berry ... 135,261
Washing machine, (91,) W. P. Brooks ... 135,316
Washing machine, (91,) B. Edgar ... 135,211
Watch, stem winding and setting, (36,) C. A. Montandon ... 135,241
Watch case spring, (36,) Laurent and Menegay ... 135,348
Watch balances, attaching hair springs to, (36,) J. Shaw ... 135,248
Water wheel, turbine, (168,) Risdon and Tyler ... 135,367

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 28, 1873.

Ackley, J. S., and D. S. Ranney, Tobacco topper ... 135,305
Adams, A., Corn sheller ... 135,306
Albrecht, A., Clothes wringer, (reissue) ... 5,261
Allenwood, J. M., Ore washing apparatus for hydraulic mining, (reissue) ... 5,255
American Button Hole, Overseaming and Sewing Machine Company, assignee, (reissue) ... 5,260
American Machine Company, assignee, (reissue) ... 5,261
Bailey, J. M., Machine for sharpening gin saws ... 135,256
Bainbridge, D., Vibrating propeller for vessels ... 135,257
Barrows, H. G., Potato digger ... 135,307
Bates, P., Jr., Car starter ... 135,193
Battey, J., Meat chopper ... 135,258
Baumann, F. F., Shoemaker's edge plane ... 135,308
Beach, S. W., Clamping movable seats for carriages, (reissue) ... 5,262
Beach Patent Shifting Carriage Seat Manufacturing Company, assignee, (reissue) ... 5,262
Beasley, J., Burnishing boot and shoe heels by machinery ... 135,259
Bell, F. G., Leather dressing compound ... 135,310
Bell, V., Barrel truck ... 135,309
Bennett, J. B., Rotary steam engine ... 135,311
Bennett, M. J., Molasses jug or pitcher ... 135,260
Berry, S., Washing machine ... 135,261
Bevelander, B., Nail separating machine ... 135,311
Bingham, A., Sewing machine ... 135,194
Blackman, A. L., Vehicle wheel, (reissue) ... 5,264
Blaisdell, P., Drilling machine ... 135,313
Bliss, F. D., Die plate ... 135,314
Blunt, J. G., assignee ... 135,293
Bockoven and Jeffers ... 135,225
Bodley, P., Dumping wagon ... 135,195
Boeklen, R., Machine for making bunga ... 135,196
Boomer G. B., T. G. Morse and R. E. Boschert, Cheese press, (reissue) ... 5,256
Boschert, Boomer and Morse, (reissue) ... 5,256
Boucher, W. F., Transparent slate frame ... 135,315
Bradford, D., Car coupling ... 135,316
Bradford, J., Revolving bullet mold ... 135,195
Bray, M., Die for forming sheet metal ware, (reissue) ... 5,257
Breval, L., apparatus for expressing liquid from spent tan bark ... 135,317
Broadwell and Michaels ... 135,239
Brooks, J. W., trustee, assignee ... 135,345
Brooks, W. P., Washing machine ... 135,318
Brown, W. G., and J. W. Jedkins, Car coupling attachment ... 135,269
Bruhn and Fischer ... 135,327
Burdge, J. M., assignee ... 135,365
Burdon, W., Steam vacuum pump ... 135,198
Burdon, W., Steam vacuum pump ... 135,199
Burdon, W., Steam vacuum pump ... 135,300
Burdon, W., Steam vacuum pump ... 135,301
Burdon, W., Steam vacuum pump ... 135,304
Burdon, W., Steam vacuum pump operated by exhaust steam ... 135,303
Byerley, N. H., Shutter fastener ... 135,319
Camp, O. S., Vent ... 135,330
Campbell, G. C., Article of food ... 135,304
Carr, C. W., Mechanical movement ... 135,263
Chicago Shot Tower Company, assignee ... 135,197
Chisholm, J., and I. C. Mayer, Truck ... 135,305
Clark, G. W., Governor for steam engines, (reissue) ... 5,258
Claughton, H. O., assignee ... 135,235
Colver, A. B., and J. Priest, Cultivator ... 135,264
Connelly, B., Device for feeding stoves ... 135,265
Corse, A. C., assignee ... 135,285
Cox, S. E., assignee ... 135,310
Cox, T., and W. Holland, Manufacture of runners and top notches for umbrellas ... 135,321
Craig, R. R. and J., assignees, (reissue) ... 5,255
Craigie, H. H., Waste trap for wash basins ... 135,206
Crocker, R., Leather cutting machine ... 135,266
Culver, J. C., Rotary engine ... 135,307
Cumings, D. M., Bottle stopper ... 135,267
Curtis, F., assignee ... 135,194
Davis Wheel and Palmer Fork Company, assignee ... 135,244
Domett, J. W., Safety check for horses ... 135,208
Dominy, G., Music leaf turner ... 135,322
Dutrow, D. E., Butter printing machine ... 135,323
Earl, W., assignee ... 135,293
Earley, E. S., Refrigerator ... 135,209
Earley, E. S., Corpse cooler ... 135,210
Edgar, B., Washing machine ... 135,211
Edwards, A., Apparatus for treating offal ... 135,294
Elder, J. F., Railway car brake ... 135,212
Evans, O., Alarm and lubricating device for car axle boxes ... 135,213
Fagan, M. G., Cooking stove ... 135,325

Fanslau, R., Machine for cutting food for animals 135,326
Fischer, H. S., and D. Bruhn, Securing carriage wheels to their axles 135,327
Fleischhauer, A., Tanning hides 135,214
Flora, F., Animal trap 135,328
Fogelstrand, O. F., Door button 135,215
Fraser, L. N., Pump handle 135,267
Freeman, W. A., Jr., Sled iron 135,328
Freeman, W. A., assignee 135,341, 135,342
Funck, S., Wood sawing machine 135,216
Gardner, D. P., assignee 135,314
Gaylord, E. L., Sewing machine lock 135,270
Gibson, C. T., Sash lock 135,317
Gildersleeve and Orr 135,265
Glidden, C. W., Machine for separating and delivering tacks 135,329
Goss, C. N., Horse hay rake 135,330
Gould, M. B., Flower pot 135,271
Graham, J. C., assignee 135,235
Gray, J. J., Card rack 135,272
Greene, W. A., Cooking stove 135,273
Greenough, J. J., Gear cutting machine 135,218
Hagerstrom, A. G., Horse power 135,331
Hagerstrom, A. G., Machine for sawing and splitting wood 135,332
Haight, H. J., Artist's scraper 135,333
Harang, T., Steam generator 135,219
Harang, T., Duplex safety valve 135,220
Hartman, B. F., Sash balance 135,221
Hendricks, N., Telegraph insulator 135,334
Hewitt, J., Smoothing and fluting iron and holder 135,335
Hinds, R. P., Counting register 135,336
Hodges, S. H., assignee 135,229
Hofman, M., Extension table 135,274
Holland and Cox 135,321
Hotchkiss, T., Paper bag machine 135,275
Houston, L., Mortising machine 135,337
Howard, L. and C., Machine for twisting oakum 135,338
Huerne, P., Filter 135,222
Hunt, C. D., Metal coating tacks, nails, &c 135,339
Hunt, F. B., Screw driver 135,340
Huntoon, L., Compound steam engine 135,223
Inman, S., Feed roll for planing machines 135,224
Ives, G. L., Combined horse rake and tedder 135,276
Jedkins and Brown 135,262
Jeffers, R., and D. C. Bookoven, Wash boiler attachment. 135,225
Jenks, W. T., Street car 135,277
Johnson, C. H., Apparatus for making ozone 135,226

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COMMISSIONER'S DECISIONS.

C. W. JENKINS *vs.* BARNEY & BERRY.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of C. W. Jenkins and the patent of Barney & Berry, No. 77,862, for an* IMPROVEMENT IN SKATES.—*Decided February 1, 1873.*]

ABANDONMENT AND INTERFERENCE—DISTINCTION—APPEALS—PRACTICE.

The question whether an invention has been forfeited should be kept entirely distinct from the question whether it has been abandoned.

If one party to an interference is adjudged the prior inventor by the Examiner of Interferences, but is refused a patent on the ground that he has abandoned the invention in consequence of its having been in public use or on sale for two years before he filed his application, an appeal by him brings up the question of abandonment only, and not that of priority of invention.

He may appeal from the decision of the Commissioner on question of abandonment to the Supreme Court of the District of Columbia.

If the adverse party desires to have the decision of the Examiner of Interferences on the question of priority revised, he must appeal from it.

If the Examiner of Interferences decides that the party who first conceived of the invention has, by his negligence in prosecuting it, forfeited his right to it in favor of another who reduced it to practice before him, an appeal by him brings up both questions.

No appeal can be allowed in such a case from the decision of the Commissioner.

Where the decision of the Examiner of Interferences left it in doubt whether he held that the party whom he found was the prior inventor had abandoned the invention or had forfeited it by his negligence in favor of his competitor, the case was remanded in order that his decision should be made explicit on that point.

LEGGETT, *Commissioner:*

The real question at issue is not very evident in this case. The Examiner of Interferences says:

"The first question which naturally arises from these facts is whether Jenkins's right to a patent has been affected by the doctrine of equitable estoppel. But before this question can be considered it must be shown that Barney & Berry, the patentees, were original and independent inventors. They are accused by Jenkins of having pirated the invention from him, and if this accusation be true, Jenkins is entitled to judgment, provided it does not appear that he has abandoned the invention to the public."

Again he says: "It remains only to be considered if the delay upon the part of Jenkins has been sufficient under the circumstances to work a forfeiture of his right to a patent." Further on he discusses and cites authorities, without discrimination, upon the question of diligence, as affecting the question of priority of invention, and the question of abandonment. The closing paragraph of his decision is as follows: "Priority of invention is awarded to Jenkins, but his right to a patent is denied for the reasons given above."

Thus the questions of diligence and abandonment, which are quite distinct, are so blended that it is not clear which of them is actually involved in the decision. There is much to indicate that priority of invention, in legal contemplation, may have been intended to be awarded to the patentee, on the ground of failure by the applicant through want of diligence, under authority of *Ransom* vs. *Mayor of New York*, and other kindred decisions. On the other hand, there is about as much to indicate that the Examiner has found the applicant to be the first inventor, and at the same time to have abandoned his invention to the public. The contestants, prompted by their opposite interests, have respectively adopted these opposite constructions of the decision. Assuming that the question of priority of invention was settled in his favor, the applicant appealed to the Board on the single question of abandonment. He now stoutly maintains that that question only is before the Commissioner—that the question of priority has been adjudicated in his favor and not appealed from by the pat-

entee. The patentee says: "If he" (the applicant) "had desired to avoid a forfeiture of his rights as inventor he should have made some little effort to secure those rights." The Board seem to have considered only the question of abandonment, yet it is by no means clear that that question was properly before them. It is quite important that all decisions, and the grounds for them, in interference cases, be particularly clear and unambiguous, that the rights of the parties under the law may be properly guarded. If priority of invention be awarded to one party because of lack of reasonable diligence of the other party, then the decision of the Commissioner is final. But if priority be awarded to a party, and at the same time it is adjudged upon the proof that he has abandoned his invention to the public, then, unless the question of priority be further contested, the question of abandonment becomes an *ex parte* question, and appeal may be taken to the Supreme Court of the District of Columbia. It is doubtful whether forfeiture and abandonment can be adjudged against the same party at the same time. The two findings are not in harmony. If a party has forfeited his right to a patent by want of diligence, then he is not, in the eye of the law, the prior inventor, and cannot, therefore, have abandoned his invention to the public. Priority in such a case is always adjudged to be with the opposing party who, though subsequent to devise, has been first to reduce the invention to practice and confer it upon the public. The necessity for appeal, too, is changed according to the construction which is placed upon the facts in proof. The party against whom judgment of priority is pronounced must appeal from that judgment if he wishes it to be reviewed, no matter whether it is accompanied or followed by judgment of abandonment or not, because the questions of abandonment and priority of invention are entirely distinct and separate questions.

This case is therefore returned to the Examiner of Interferences, who will review his decision and free it from uncertainty as to his intentions in the matter above indicated.

C. E. RICHARDSON *et al.*—*Appeal.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of Charles E. Richardson et al. for the registration of a Trade-Mark.—Decided February* 7, 1873.]

TRADE-MARKS—THE WORD "PATENT" IN TRADE-MARKS.

The name under which a patented article has been sold during the lifetime of the patent becomes public property when the patent expires, as well as the article, and cannot be appropriated as a trade-mark.

After a patent has expired, to include the word "Patent" in a trade-mark for the article is calculated to mislead the public, and the registration of it will not be allowed.

The words "A. Richardson's Patent Union Leather-Splitting Machine," under which the article protected has been sold during the lifetime of the patent, cannot be appropriated as a trade-mark for it after the patent has expired, neither can they be though the word "Patent" is omitted.

The word "Union," having been attached to a patented article during the life-time of the patent, has acquired a distinctive meaning, has lost its character as an arbitrary symbol, and is not registrable as a trade-mark.

LEGGETT, *Commissioner:*

Applicant petitions for the registration of the words "A. Richardson's Patent Union Leather-Splitting Machine." It appears that the leather-splitting machine he proposes to manufacture and place this alleged trade-mark upon has been patented, manufactured, and put upon the market under the above caption during the past twenty years, and that the patent has expired. The Examiner has therefore held that the word "Patent" cannot properly be sanctioned as part of this trade-mark, because it would tend to deceive the public and perhaps induce a violation of section 39 of the patent act. Applicant then proposes to drop this word, and asks that the words "A. Richardson's Union Leather-Splitting Machine" be registered, if, in the opinion of the Commissioner, the words as originally submitted must be rejected. This does not relieve the case of another objection. The words presented have become the generic name of these machines by which the public now know them. They have been before the country under this caption as patented devices. The right to make them has now fallen into the hands of the public, and why should the public not have the right to use the name by which they are known and which they have acquired by virtue of the patent? When a device becomes public property its name must also. If the word "Union" were now adopted for the first time, it would no doubt in this connection be an arbitrary symbol and render the words presented registrable. But it has become a part of the name of the device to which it is proposed to be applied, and therefore registration must be refused.

STERNBERGER *vs.* THALHEIMER & HIRSCH.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the application of Leopold Sternberger, for registration of a certain Trade-Mark, and a certificate of registration granted Thalheimer & Hirsch.—Decided February* 8, 1873.]

ADOPTION OF TRADE-MARK—ADMISSIBILITY OF EVIDENCE.

Parties who employ a word in an experimental way in five or six instances, and take no further steps with it for three months, do not thereby gain a title to it as a trade-mark as against one who has in the meanwhile adopted it and put it into general use.

Neither will the latter lose his right to it because the others procure it to be registered.

Upon an interference between an application for the registry of a trade-mark and a trade-mark already registered, evidence was adduced tending to show that the applicant had admitted in conversation that he had not previously made use of the trade-mark: *Held*, that it was competent for him to prove, although upon the rebuttal, that he had been in the use of it prior to the conversation.

THACHER, *Acting Commissioner:*

The subject-matter of this controversy is the word "Centennial" to be used as a trade-mark for certain articles of clothing.

The question for determination is somewhat different from that which arises in interferences between applications for patents. It is not priority of invention or priority of production even, but priority of adoption by actual use. This circumstance will be of some assistance in deciding a preliminary question as to admissibility of certain testimony. Under an extension of time Sternberger proceeded to take rebutting testimony, to most of which objection is taken by respondents on the ground that, as it goes to prove the date and extent of use of the mark by Sternberger, it is direct and not responsive evidence on their part. In the testimony for Thalheimer & Hirsch a certain conversation between them and Sternberger is sworn to. The latter had some time previous obtained certificate of registration for the word "centennial" in connection with certain devices. Burgaeur swears that Sternberger, alluding to this, said: "We have that patent laying at home, but I do not know whether we will ever make use of it." Thalheimer says: "Mr. Sternberger remarked, although they had that trade-mark registered previous to ours, he did not know whether they would ever make any use of it." This is equivalent to an admission on the part of Sternberger that he had not used the mark up to the date of the conversation, and as it occurred subsequent to the date of use sworn to by Thalheimer & Hirsch, would be fatal to the claim of the former. A simple denial of the conversation would hardly be sufficient under the circumstances. The testimony of these witnesses could be successfully rebutted only by proof of actual use before the conversation took place. I think, therefore, that the evidence is competent and should be admitted.

Thalheimer & Hirsch state that they commenced the use of their mark the beginning of March, 1872, and this averment they support by testimony of their engraver, box-maker, and one of their salesmen.

The only attempt to fix a precise date, however, is in the deposition of Hirsch, who states that the application for registration was forwarded the 20th of March, 1872, and that they had used the mark two weeks previously, which would make the date of first use about the 6th of March. It is left a matter of uncertainty, however, and might vary four or five days either way. Their box-maker, Hoover, was called by Sternberger in rebuttal. His testimony throws some light upon the nature of this first use of the mark by his employers. He says that some time in February or March, Hirsch gave him five or six of the labels which he pasted on boxes and returned; that the object in making up these few boxes was to decide the question of colors; and that the first considerable quantity was not delivered until the 13th of June, 1872. This is somewhat damaging to the statement of Thalheimer & Hirsch that these labels were affixed to boxes containing shirts and exposed for sale, and that their use was continuous from that time forward. The whole matter is left in a cloud of doubt and uncertainty, and I am unable to decide just when the respondents began to use the mark in such way as to constitute adoption.

On the other hand, the testimony is conclusive that on the 12th of March, 1872, at least twelve dozen shirts were stamped with the word "Centennial" for Sternberger, which were exposed in his store and some of them actually sold. The 25th of June following another lot of forty-five dozen was stamped in the same way and put on sale. In view of the fact that Sternberger had as early as February, 1872, obtained a certificate of registration for a trade-mark of which the word "Centennial" constituted a part, thus giving evidence and publication to the world of his intention to use the word for trade-mark purposes, and that he fixes definitely the actual commencement of its use as such but a little later, I am of the opinion that the weight of evidence is in his favor.

The decision of the Examiner of Trade-Marks is therefore affirmed, and the right to a certificate of registration awarded to Sternberger.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

ABEL E. BRIDGE *et al. vs.* RUFUS H. BROWN *et al.*—*Infringement.*

[*In Equity.—Before Shepley, Judge.—October Term*, 1872.]

A patent for an apparatus for making extracts from tan-bark by means of exhaust steam, which claims in combination an exhaust-steam pipe, a leach, and intermediate boxes in which the steam is condensed, and also expands so as to avoid back pressure on the piston, is not infringed by a similar apparatus in which there is no exhaust-pipe nor provision for avoiding back pressure, but the steam is taken directly from the boiler.

[*T. L. Wakefield*, for complainants.

Ives & Lincoln and *G. L. Roberts*, for defendants.]

SHEPLEY, *J.:*

Letters Patent No. 50,626, issued October 20, 1865, to S. M. Pingree, for a new and improved apparatus for making extracts from tan-bark. The patentee declares that "the object of this invention is to utilize *exhaust steam* from a steam-engine for the purpose of making extracts from tan-bark and other materials." The invention consists, according to the specifications of the patent, in the arrangement of a box with perforated sides and bottom, in combination with a pipe which conducts the exhaust steam to the leach containing the bark or other material to be extracted, in such manner that the steam is free to expand and made to condense partially as it passes from the exhaust-pipe into said box, and all back pressure on the piston is avoided, and at the same time the full benefit of the action of the steam on the bark or other material is obtained. The patentee then describes a leach, which is provided with a tightly-fitting cover, and which, for the sake of convenience, may be divided off by transverse partitions into a series of compartments. A pipe extends over the entire length of the leach, and branch pipes lead from this pipe down into the several compartments. The bark or material to be extracted rests on slotted or perforated false bottoms, and the branch pipes lead into boxes which are situated close to the leach. The cross-section of the boxes is considerably larger than that of the pipes, so that the steam in passing into the same is free to expand, and the sides of said boxes are perforated with a large number of holes through which the steam passes out to the bark. The pipe D is intended to connect with the exhaust-pipe of a steam-engine, and as the exhaust steam passes through said pipe and the branch pipes into the boxes, it expands readily and a partial condensation takes place, both within said boxes and outside of the same, and by this partial condensation, combined with the rapid expansion of the steam as it reaches the boxes, all back pressure on the piston of the engine is avoided. Thus he says: "By my apparatus the exhaust steam is utilized and a great saving in fuel is effected." The claim of the patent is for—

"The boxes G with perforated sides, applied in combination with the exhaust-pipe D and leach A or its equivalent, in the manner and for the purpose substantially as set forth."

The patent is for an apparatus for making extracts from tan-bark and other material, not for the process of extracting the tannin, but for an apparatus consist-

ing (*first*) of the boxes G with perforated sides, applied in combination with (*second*) *the exhaust-pipe D* and (third) leach A or its equivalent, (fourth) in the manner and (fifth) for the purpose substantially as set forth.

In the state of the art at the date of the invention of Pingree there was nothing new in the form or structure of his leach, nor in the mode or purpose of its use, apart from the introduction into it of steam from the exhaust-pipe of an engine instead of from a steam-pipe taking its supply directly from a boiler. The boxes with perforated sides are not claimed except as combined with the exhaust-pipe and leach, in the manner set forth in the patent, and for the purpose set forth. This purpose was the utilization of exhaust steam and the consequent saving of fuel in making extracts from tan-bark and other materials. There is no evidence in this case that the defendants use the complainants' combination. They do not use the boxes G in combination with the exhaust-pipe D in the manner or for the purpose set out in the patent, that manner and purpose being in the patented apparatus that the exhaust-pipe should conduct the exhaust steam to the leach in such manner that the steam is free to expand, and made to condense partially as it passes from the exhaust-pipe into said box, and *all back pressure on the piston is avoided*, and at the same time the full benefit of the action of the steam on the bark is obtained. Respondents do not use their boxes to conduct exhaust steam to the leach, nor for the purpose of condensing the steam and avoiding back pressure on the piston. They do not use exhaust steam, but take their steam directly from the boiler. They do not use their boxes in combination with complainants' exhaust-pipe, for they do not use any exhaust-pipe or any equivalent for it. The pipe used by them is not like the pipe D, the exhaust-pipe of a steam-engine, and is not capable of being used for that purpose. The dimensions of the pipe are such as would effectually prevent its use for any such purpose, in connection with the process for which it is used by the respondents. It is contended by complainants that although the apparatus patented by Pingree is designed for exhaust steam, their patent would cover its use for any cognate purpose. It is a sufficient answer to this position that it has already been shown that respondents do not use all the elements of their combination as described and claimed in their patent. Respondents' steam-pipe is not the exhaust-pipe D or the equivalent of the pipe D described in Pingree's claim. No case of infringement is made out, and complainants' bill must be dismissed.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

ELI W. BLAKE *et al. vs.* GEORGE W. RAWSON.

[*In Equity.—Before Shepley, Judge.—October Term*, 1872.]

NOVELTY IN STONE-CRUSHERS—ABANDONED EXPERIMENTS—PRACTICE IN INJUNCTION CASES.

Blake's stone-crusher, consisting of two jaws nearly vertical, but inclining from each other upward, and by a reciprocating movement of one to and from the other, crushing the stone as it falls till the fragments pass out at the bottom, is novel, although a previous machine crushed and ground stone between a horizontal cylinder oscillating on its axis and the sides of an eccentric basin approximating to the periphery of the cylinder at the bottom.

The existence twenty years before of a single machine similar to that described in a patent, which was abandoned directly, and which appears to have been impracticable, will not invalidate the patent.

Upon a motion for an injunction the merits of the patent will be considered anew, although it has been sustained on similar hearings before other judges, if it is alleged that new facts are in proof, and that the merits were not properly presented on those hearings.

[*H. T. Blake* and *G. W. Baldwin*, for complainants.
Shennan & Drew, for defendant.]

SHEPLEY, *J.*:

This bill in equity is brought for an alleged infringement of the reissued patent of January 9, 1866, to Eli W. Blake, for a new and useful machine for breaking stones for road and other purposes.

This patent has already been before the court, and has been sustained by Judge Shipman in the case of *Blake* vs. *Stafford*, (3 Fisher, 294,) whose decision in that case was sustained by Mr. Justice Nelson on a motion for a new trial, and also in the case before Judge Drummond. (*Blake* vs. *Eagle Works Mfg. Co.*, 4 Fisher, 591.)

The principal points relied upon in the present case by the learned and able counsel for the respondents, are those which are also set up in the answer in relation to the alleged prior inventions of James Hamilton, as described in letters patent of the United States issued to him on the 3d of January, A. D. 1854, for "Improvements in machinery for crushing and grinding quartz and other hard substances," and also of one Samuel Forward (or Forwood,) of Louisville, Kentucky, who constructed a machine for breaking stones for roads in Louisville, in the year 1847.

The answer sets forth, and counsel contends that the facts and law applicable to these two machines as compared with the combination patented to the complainant, were not properly presented to the judges who tried and decided those cases, and also shows that some of the facts adduced and proved by this respondent in support of some of the allegations now made by this respondent were not made and proved in either of the causes above named. For these reasons we have carefully considered the testimony of the witnesses and the opinions of the experts in relation to the quartz-crusher of Hamilton, and the rock-breaker of Forwood, without regard to any previous action on this patent by any court, as if it had never been tried or adjudicated upon.

The essential characteristics of Blake's stone-crusher are two jaws between which the stones are to be broken, having their acting faces so nearly in an upright position that stones to be broken will descend by force of gravity between them, and convergent downward one toward the other in such manner that, while the space between them at the top is such as to receive the stones to be broken, the space at the bottom is only sufficient to allow the fragments to pass when broken to the required size; and a revolving shaft with a fly-wheel driven by steam or other power, with such intervening mechanism between the revolving shaft and the movable jaw as shall impart to the jaw a definite vibratory movement, causing it to advance with great power toward the other jaw through a short and definitely-limited space, and alternately to recede and advance, so that the stones fall down between the jaws until their descent is arrested between the convergent faces, when

the movable jaw advancing crushes the stones, and, receding, liberates the fragments and they again descend, and if too large to pass through the space at the bottom of the jaws, they are again arrested and broken by the advancing movable jaw until the fragments are sufficiently reduced in size to pass through. The patentee does not claim the manner of supporting the jaws in their proper relative position, or his particular mode of imparting the definite motion with the required power to the movable jaw from the revolving shaft. These, he claims, may be varied indefinitely without affecting the principle of the operation. After describing the invention which he claims, the patentee describes the form in which he embodies his invention, and it is evident from the claims in his patent, taken in connection with the specification to which they refer, that although he describes a crank, lever, and toggle-joint as one mode, and the mode adopted by him of communicating a definite motion to the movable jaw from the revolving shaft, no construction can properly be given to the patent, such as is suggested by respondents, which would limit it to the toggle-joint mechanism, which is described by the patentee as the particular form in which one element of the patented combination is constructed and embodied in one form of his machine. The machine patented frequently has a broader scope than the particular *form* of the machine described as the form *used* by the patentee. The question of novelty is to be settled by a comparison of prior machines with the machine patented rather than the form of the machine in use.

The Hamilton quartz-crusher, relied upon as an invention antedating the complainant's, is a combination of certain elements which, separately considered, do not materially differ from the elements of the combination described in the Blake patent. All the elements of the combination are old in both machines. The novelty in both consisted in the peculiar mechanical combination of the members of the contrivance and the resultant mode of operation. The movable jaw in the Blake machine advances toward and recedes from the fixed jaw in a direction substantially at right angles with the faces of the jaws, so that, when advancing, the stones are nipped and crushed between the jaws, and when receding the stones are liberated. In the Hamilton quartz-crusher there is a cylindrical roller or pestle in a basin having its sides eccentric to the circle of the movement of the roller or cylindrical pestle, the inner sides at the bottom of the curved basin gradually approximating to the circle of movement of the cylindrical roller. This cylinder is made to move around its central shaft with a reciprocating vibratory movement, but being cylindrical and turning upon a fixed central axis, can only move in the direction of the periphery of the cylinder. The surfaces of the cylinder operate upon the material by a grinding process tending to rotate the stones on their own axis, and at the same time to draw them down into a space where, by reason of the eccentricity of the opposite surfaces, they are nearer to each other than at the point where they begin to operate on the stones to be crushed. In the Hamilton machine every point on the acting face of the roller moves in the segment of the circle of the periphery. In the Blake machine it is strictly correct to say that the points in the movable jaw advanced toward the fixed jaw in an arc of a circle, but the *whole* movable jaw advances toward and recedes from the fixed jaw, and the space through which it moves is so small, compared with the periphery of the circle which would be described if its rotation were continued, that the operation upon the material is substantially the same as if the movable jaw were advanced toward the fixed jaw in a direction at right angles with the face of the jaw, nipping and crushing the material at the points of impact without any tendency to a rotating or grinding action upon it. In the Hamilton crusher the surface of the rotating cylinder passes laterally by the surface of the basin, reducing the material both by the grinding operation and by moving it into a space progressively narrower, as if it was passing between rollers. The mode of operation is different in the two machines. It is not always enough to prove that two combinations of elements are equivalent, to show that each element of the combination in one may be regarded under some circumstances as the equivalent of the corresponding element in the other, when the elements are separately considered. If the mechanical combination of the members of the two machines be such that the action and mode of operation differ in the two machines, then one is something more than a mere mechanical equivalent for the other. A careful examination of the evidence in the case, and close comparison of the working models of the two machines, has resulted in forcing upon my mind the same conclusion arrived at by Mr. Justice Nelson, in the case of *Blake* vs. *Stafford*, when he says: "Hamilton's quartz-crusher neither embodies the arrangement nor mode of operation of the plaintiff's machine, but operates upon a different principle and embodying a different set of ideas."

The Forwood machine is not in existence, and no such machine is proved to have been in existence within twenty years. There is no evidence tending to show that more than one Forwood machine was ever made or used. Only two persons testify to having seen that machine. Only one witness testifies to anything which can possibly be claimed to have been any other than an experimental use. The model introduced in evidence, constructed to correspond with the description of the machine as testified to by these two witnesses, according to their recollection, after the lapse of twenty years, does not in some important particulars correspond with the drawings given by one of the witnesses, and the two witnesses differ also materially in their statements. The principal feature of the Forwood machine was that it had two horizontal jaws, each from six to seven feet long, whose opposite bearings were from twelve to fourteen feet apart. The crushing-faces of these jaws were proximately segments of a circle, the radius of which is represented by the length of the jaw. In the downward movement of the two jaws they operated in the crushing process upon the material as if it were passing between two cylinders of a diameter of twelve or fourteen feet. The idea of the machine seems to have been, by use of two segments of cylinders of this diameter, to avoid the use of such cumbrous and expensive devices as two cylinders of such great diameter and great weight and expense as their requisite strength would have involved, and at the same time to obtain the same result. There was no lateral movement by which the jaws could be made to recede from each other

after the crushing process resulting from the downward movement. The upward movement of the jaws was one which threw them against and lifted the whole mass of superincumbent material. In view of this obvious feature of the machine, it is impossible to credit the testimony of Johnson or to agree with the opinion of the expert that this was ever a practically successful machine. The inference that it was not is also strengthened by the fact that it was immediately abandoned, and never appears to have been used afterward, and there is no evidence that a second one like it was ever made. It is difficult to see how Blake could have been aided in the development of the ideas embodied in his structure by any suggestions he could possibly have received from Forwood's machine, if that had been in existence and known to Blake when he was developing his invention.

It is too clear to require any extended remarks, that no one of the other machines referred to in the answer anticipated the invention of Blake. He is therefore to be considered as the original and first inventor of what he claims in his patent. Applying the construction already given to those claims, the infringement by the Rawson machine is obvious.

Decree for complainants.

U. S. CIRCUIT COURT—DISTRICT OF MAINE.

JAMES R. OSGOOD *et al. vs.* EDWARD C. ALLEN.

[*In Equity.—Before Shepley, Circuit Judge.—Decided December,* 1872.]

COPYRIGHT IN TITLE—TRADE-MARK AND INVASION THEREOF.

A title separate from the publication which it is used to designate is not protected by the copyright law. It is only as a part of the copyrighted book, and as the title to that particular literary composition, that the title is within the provisions of the copyright act.

The office of a trade-mark is to point distinctively to the origin or ownership of the article to which it is affixed.

Generic names and those merely descriptive of an article or of its qualities or ingredients, and geographical names which point out only the place of production and not the producer, are not the subject of trade-mark.

In all cases of invasion of rights to the exclusive use of a trade-mark, the essence of the wrong consists in the sale of the goods of one manufacturer or vender as those of another.

A suit in equity brought by the complainants, proprietors and publishers, at Boston, Massachusetts, of an illustrated copyrighted monthly magazine, entitled "Our Young Folks, an Illustrated Magazine for Boys and Girls," against the defendant, publisher, at Augusta, Maine, of a semi-monthly paper, also copyrighted, entitled "Our Young Folks' Illustrated Paper." The two publications were in no respect similar, excepting in the use in the title of each of the words, "Our Young Folks."

Upon bill founded upon alleged copyright and trade-mark right in the words "Our Young Folks," filed to restrain the defendant from continuing the publication of his paper: *Held*, 1. That the complainants had no copyright in the words "Our Young Folks" separate from the copyrighted magazine. 2. That the cause should be referred to a master to ascertain whether the public had been deceived, or was in danger of being deceived, into the belief that the respondents' publication was, in fact, that of the complainants', and thereby led to purchase the same.

[*R. M. Morse, Jr.*, and *R. Stone, Jr., Butler & Fessenden*, of Portland, for plaintiffs.

Orestes Brown and *J. B. Holmes, A. R. Strout*, of Portland, for defendants.]

SHEPLEY, *J.*:

The complainants are the proprietors and publishers of an illustrated magazine for boys and girls, entitled "Our Young Folks," which has been published monthly, in the city of Boston, under the same title, since December, 1864. Previous to the publication of the first number the publishers duly entered the title of their magazine for securing the copyright thereof. The publication and sale have been continued in regular monthly numbers by the firm of Ticknor & Fields and their successors, including the complainants, and the copyright of each number was taken out and secured according to law, previous to its publication. Complainants allege that when the copyright of the first number was taken out the title "Our Young Folks" had not been adopted and was not in use for any other similar publication, and has not been used for any similar publication since, except by the defendant; that they have expended large sums of money in publishing and selling the same; that by reason of their expenditure and the care and skill by them bestowed, the magazine has acquired an extensive and valuable reputation throughout the United States and elsewhere as a publication for young people under the title of "Our Young Folks," and was a source of profit to complainants.

The respondent, a publisher at Augusta, Maine, announced by advertisements and otherwise that he would publish on the first and fifteenth days of each month, commencing October 1, 1871, an illustrated publication for young people under the title "Our Young Folks' Illustrated Paper."

It is admitted that he accordingly did issue a very large edition of his illustrated publication, a copy of which is filed with the proofs in the case, and that, upon demand by the complainants before publication, he refused, and still refuses, to withdraw the announcement of the publication or to change the title, and has published and sold large numbers under said title. The complainants claim that they are entitled to a remedy under the law of copyright, and also that they have a right to the exclusive use of the name "Our Young Folks," as indicating a periodical, according to the doctrine of trade-marks as applied to the protection of literary publications. It is apparent upon inspection, and not disputed, that the publications of the complainants and the respondent are in no respect the same or even similar, except in the use by both of the words "Our Young Folks" as a part of the title. The title of the one on the title page is "Our Young Folks; an Illustrated Magazine for Boys and Girls;" of the other "Our Young Folks' Illustrated Paper." Both are illustrated periodicals for the young. The reading matter and the illustrations are not the same or similar.

Copyright laws are designed for the encouragement of learning by securing to authors and their representatives the exclusive right to the publication of their literary compositions, as patent laws secure to inventors certain exclusive rights in their discoveries. The constitution conferred upon Congress the power to promote the progress of science and the useful arts "by securing for limited times to authors and inventors the exclusive rights to their respective writings and discoveries." Accordingly, in 1790, Congress passed an act for the encouragement of learning by securing the copies of maps, charts, and books to the authors and proprietors of such copies, during the times therein mentioned.

This act provided that the author and authors of any

map, chart, book or books * * * "shall have the sole right and liberty of printing, reprinting, publishing and vending such map, chart, book or books for fourteen years from the time of recording the title thereof." The remedy provided by this statute was a right of action given to the proprietor of the copyright against any person who, without his consent, should publish, sell or expose to sale, or cause to be published, sold or exposed to sale any copy of such map, chart, book or books.

The act of 1870 "to revise, consolidate and amend the statutes relating to patents and copyrights," provides that the author * * * or proprietors of any books, &c., shall, upon complying with the provisions of this act, have the sole liberty of printing, reprinting, publishing, completing, copying, executing, finishing, and vending the same.

The nineteenth section provides that no person shall be entitled to the benefit of the act unless he shall, before publication, deposit in the mail for the librarian of Congress a printed copy of the title of such book, and shall, within ten days after publication, mail to the librarian two copies of such copyright book. The remedy of the author or proprietor under this statute is against the person who, without the consent in writing of the proprietor of the copyright, shall print, publish, or import, or knowing the same to be so printed, published, or imported, shall sell or expose to sale any copy of such book.

By the plain terms of the statute, the copyright protected is the copyright in "the book," the word "book" being used to describe any literary composition. Although a printed copy of the title of such book is required before the publication to be sent to the librarian of Congress, yet this is only as a designation of the book to be copyrighted, and the right is not perfected under the statute until the required copies of such copyright book are, after publication, also sent. It is only as a part of the book and as the title to that particular literary composition, that the title is embraced within the provision of the act. It may possibly be necessary in some cases, in order to protect the copyrighted literary composition, for courts to secure the title from piracy, as well as the other productions of the mind of the author in the book. The right secured by the act, however, is the property in the literary composition, the product of the mind and genius of the author, and not in the name or title given to it. The title does not necessarily involve any literary composition; it may not be, and certainly the statute does not require, that it should be the product of the author's mind. It is not necessary that it should be novel or original. It is a mere appendage which only identifies and frequently does not in any way describe the literary composition itself or represent its character. By publishing, in accordance with the requirements of the copyright law, a book under the title of the life of any distinguished statesman, jurist, or author, the publisher could not prevent any other author from publishing an entirely different and original biography under the same title. When the title itself is original and the product of the author's own mind, and is appropriated by the infringement, as well as the whole or a part of the literary composition itself, in protecting the other portions of the literary compositions courts would probably also protect the title. But no case can be found either in England or this country in which, under the law of copyright, courts have protected the title alone separate from the book which it is used to designate. In *Jollie* vs. *Jacques*, 1 Blatchford 627, Mr. Justice Nelson says: "The title or name is an appendage to the book or piece of music for which the copyright is taken out, and if the latter fails to be protected, the title goes with it as certainly as the principal carries with it the incident." The only doubt expressed by Mr. Justice Nelson in that case is how the question might be decided in case of a valid copyright of a book and an infringement of the title by the defendant. While expressing no opinion upon this question, the reasoning by which he arrives at the conclusion that when the book fails to be protected the title goes with it would seem clearly to point to a similar result in a case of alleged infringement of copyright of the book, namely, that if there was no piracy of the copyrighted book, there could be no remedy under the act for the use of a title which could not be copyrighted independently of the book. The injunction granted in the case of *Hogg* vs. *Kirby*, 8 Vesey, 215, was not founded on copyright, but on the power a court of equity has to restrain one person from carrying on a trade or from publishing a work under a fraudulent representation that such trade or work is that of another. The chancellor (Lord Eldon) in the opinion in that case says: "In this case, protesting against the argument that a man is not at liberty to do anything which affects the sale of another work of this kind, and that because the sale if affected, therefore there is an injury, (for if there is a fair competition by another original work really new, be the loss what it may, there is no damage or injury,) I shall state the question to be, not whether this work is the same, but in a question between these parties whether the defendant has not represented it to be the same; and whether the injury to the plaintiff is not as great and the loss accruing ought not to be regarded in equity upon the same principles between them as if it was in fact the same work. Upon the point whether the work was in fact meant to be represented to the public as the same, I do not say that it is not a question proper for a jury." In the case of *Jollie* vs. *Jacques*, Mr. Justice Nelson declined to consider the question whether the court will interfere to prevent the use of a title in fraud of the plaintiff upon principles relating to the good will of trades, because, in the case before him, both parties were residents, and, for aught that appeared in the case, citizens of New York, and therefore independently of copyright, the Court had no jurisdiction in the case.

In the case before this Court the bill is filed by complainants as citizens of the Commonwealth of Massachusetts, against the defendant, a citizen of Maine. Relief is sought not only under the law of copyright but upon the general ground of equity as related to the good will of trades and the doctrine of trade-marks. It becomes necessary for the Court to determine, in this case, how far the complainants are entitled to a remedy upon these grounds of equity jurisdiction and upon the general principles governing courts of equity jurisdiction. Property in the use of a trade-mark or name has very little analogy to that which exists in copyrights or patents for inventions. In all cases where rights to the exclusive use of a trade-mark are invaded, the essence

of the wrong consists in the sale of the goods of one manufacturer or vender as those of another. It is only when this false representation is directly or indirectly made that the party who appeals to a court of equity can have relief. *Canal Company* vs. *Clark*, 13 Wallace, 311, 322; words or devices may be adopted as trade-marks, which are not original inventions of the one who adopts and uses them. Words in common use may be adopted if, at the time of adoption, they were not used to designate the same or similar articles of production. A generic name, or a name merely descriptive of an article of trade or its qualities or ingredients, cannot be adopted as a trade-mark so as to give a right to the exclusive use of it. The office of a trade-mark is to point distinctively to the origin or ownership of the article to which it is affixed. Marks which only indicate the names or qualities of products cannot become the subjects of exclusive use, for from the nature of the case any other producer may employ, with equal truth and the same right, the same marks for like products. Geographical names which point out only the plan of production, and not the producer, cannot be appropriated exclusively, so as to prevent others from using them and selling articles produced in the districts they describe under these appellations. In the case of *Brooklyn White Lead Company* vs. *Masury*, 25 Barbour 416, the Court said that as both plaintiff and defendant dealt in the same article, and both manufactured it at Brooklyn, each had the same right to describe it as Brooklyn white lead.

Lord Langdale, master of the rolls, well expresses the whole law of trade-marks by names in the case of the *Collins Company* vs. *Cowen*, 3 Kay & Johns 428. He says: "There is no such thing as property in a trade-mark as *an abstract name*. It is the right which a person has to use a certain name for articles which he has manufactured, so that he may prevent another person from using it, because the mark or name denotes that articles so marked were manufactured *by a certain person*, and no one else can have the right to put the same name upon his goods and then represent them to have been manufactured by the person whose mark it is. Applying these principles to the case before the Court, the question presented on this branch of the case is whether the defendant has so simulated the mark of the complainant as to deceive the public so that the public will naturally mistake his publication for that of the complainant."

Complainants aver that defendant fraudulently designing to procure the custom and trade of persons who are in the habit of buying their magazine, and to induce them and the public to believe that his publication is in fact the complainants', and in order to obtain for himself the benefit of the reputation of complainants' publication, advertises, prints, and offers for sale his publication under that title, and alleges thereby the public will be deceived by the title, and led to purchase respondent's publication under the belief that it is the magazine of the complainants. The agreed statement of facts is silent on the question whether the public are deceived or are in danger of being deceived as alleged. And whether the customers of the complainants or the public are induced to believe, or are in danger of being induced to believe, that respondent's publication is in fact the complainants', and thereby led to purchase the respondent's magazine under the belief that it is the complainants'.

The case will therefore be referred to a master to ascertain and report the fact upon the foregoing questions to the Court, and further proceedings in the case will be stayed until the coming in of the master's report.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 19, 1873.

23,097.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 12, 1873.

23,105.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 12, 1873.

23,152.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,262.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PETTEE, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ATHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859 Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,629.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GERRISH, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GERRISH, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL R. ·Y and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again in three divisions, Nos. 4,694, 4,695, and 4,696, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,691 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 16, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,9 3, June 6, 186 ; No 1,180 having been ordered to again reissue, No. 5,219, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S MERRIMON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Slate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIVELY, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,880.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Slate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. H. BEARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859 Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

EXTENSIONS GRANTED.

23,001.—*Improvement in Elastic Toys*, granted to LUCIUS P. PORTER, February 15, 1859.

Claim.—1. The combination of a reed or other speaking device with a hollow elastic toy made of caoutchouc or gutta percha, or their compounds, for acting together, the former by the latter, substantially as specified.

2. The manner herein described of securing the reed-frame to the toy by grooving the frame on its edges or periphery and inserting it in a hole in the toy, so as to be clasped in the groove by the edges of the elastic material in which the receiving aperture is made.

22,990.—*Improved Mop-Head*, granted to LUKE TAYLOR, February 15, 1859; reissued November 10, 1868, numbered 3,192; reissued November 24, 1868, numbered 3,215; reissued October 19, 1869, numbered 3,682.

Claim.—1. In a mop-head, in which the cross-head or stationary jaw is attached permanently and immovably to the handle, operating the movable jaw or binder by means of a tubular screw or socket fitted on the handle, and having its screw-thread on its exterior, in combination with a nut encompassing the screw, and connected with the movable jaw, so as to operate substantially as shown and described.

2. In a mop-head, in which the movable jaw or binder is operated through the medium of a screw-nut or collar, by means of thumb-ears attached to or formed with the said screw-nut or collar, placing the said ears outside the yoke or bow of the movable jaw or binder aforesaid, as herein described, for the purpose set forth.

22,947.—*Improvement in Wrenches*, granted to DANIEL P. FOSTER, February 15, 1859.

Claim.—Making the hinge-joint between the stationary and movable jaw of the wrench at *a*, viz., by the projection *c* on the stationary jaw and the depression *s* in the washer that is on the shank of the movable jaw, for the purpose of allowing the movable jaw to change its position in relation to the stationary one, as herein set forth, and for the purpose explained.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 4, 1873.]

6,378.—*Card-Receiver.*—GEORGE GILL, Taunton, Mass., assignor to REED and BARTON, same place.

6,379.—*Cake-Basket.*—GEORGE GILL, Taunton, Mass., assignor to REED & BARTON, same place.

6,380.—*Cake-Basket.*—GEORGE GILL, Taunton, Mass., assignor to REED and BARTON, same place.

6,381.—*Center-Piece.*—SAMUEL KELLETT, San Francisco, Ca.

6,382.—*Urn for Hot Water, &c.*—PHILIP P. MEYER, New York, N. Y.

6,383.—*Beer-Mugs.*—JOHN OESTERLING, Wheeling, W. Va.

6,384.—*Vase.*—WILLIAM H. WILKINSON, New York, N. Y., assignor to NORTH AMERICAN IRON WORKS, New York.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date February 4, 1873.]

1,115.—*Hams.*—EVANS BROTHERS, Cincinnati, Ohio.

1,116.—*Anti-Friction Metal and Journal Bearings.*—I X L METAL COMPANY, St. Louis, Mo., and Sacramento, Cal.

1,117.—*Galvanized Sheet-Iron.*—MCCULLOUGH IRON COMPANY, Philadelphia, Pa.

1,118.—*Galvanized Sheet-Iron.*—MCCULLOUGH IRON COMPANY, Philadelphia, Pa.

1,119.—*Boots and Shoes.*—CHARLES MERRITT, South Weymouth, Mass.

1,120.—*Gin.*—F. E. SUIRE & Co., Cincinnati, Ohio.

1,121.—*Gin.*—F. E. SUIRE & Co., Cincinnati, Ohio.

1,122.—*Gin.*—F. E. SUIRE & Co., Cincinnati, Ohio.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date February 4, 1873.]

ORIGINAL PATENTS.

135,395.—*Fire-Kindler.*—ROBERT ADAMS, East Enterprise, Ind.

Claim.—1. The combination of the sticks 1 2 3, &c., with the nail B or its equivalent, substantially as and for the purpose hereinbefore set forth.

2. The X-shape, together with the right-angle one-piece upon another construction of my kindler and resulting convenience in applying the combustible solution to the whole or part of the kindler, substantially as and for the purpose hereinbefore set forth.

135,396.—*Sash-Fastener.*—JOHN BISHOP, Northville, Mich.

A metallic shell, varying but slightly from the ordinary drawer-pull or sash-lift, is provided with a weighted bell-crank, hung by its short arm in the upper corner of the same. A bolt, having its inner end pivoted to the angle of the bell-crank, plays through a horizontal slot in the side of the lift. The long or weighted arm of the crank operating the bolt, and the case or shell with its concealed fixtures, is attached to the face of the sash, near the casing, serving as a combined sash lift and fastener.

Claim.—The combination of the lifting-case A, slotted at its side and arranged upon the surface of the sash, the weighted bell-crank B, and fastening-bolt C pivoted thereto, when these latter are concealed within the case, all substantially as described and shown, for the purpose set forth.

135,397.—*Gas-Retort Scraper.*—LA FAYETTE BLAIR, Painesville, Ohio.

A plate made to conform to the interior of the retort, and having attached at its upper exterior surface a series of spring-scrapers. Two guides are arranged at its lower corners to guide and steady the same while in use.

Claim.—1. The sectional spring-scrapers B, said scrapers conforming to the form of the plate C, substantially as and for the purpose as hereinbefore set forth.

2. The combination of the spring-scrapers B, plate C, and the slide-guides D, substantially as and for the purpose as hereinbefore set forth.

135,398.—*Elevator.*—JOHN H. BLOHM, New York, N. Y.

A sliding frame in the frame-work of the elevator is provided with a clutch or pinchers, whereby the rope or rod by which the engine that works the elevator is stopped, started ahead or back, can be griped whenever desired to operate the engine.

Claim.—1. The combination, with the rope or rod H which operates the engine, the clutch or pinchers G G' attached to a sliding frame, F, said pinchers being operated by suitable springs *n n* and ropes or chains *m m* attached to a wheel, J, fast to the spindle K, substantially as and for the purpose hereinbefore set forth.

2. The arrangement of the rope or rod H which operates the engine, outside of the inner paneling of the elevator, in combination with a clutch or pinchers, substantially in the manner and for the purpose described.

135,399.—*Machine for Felting Hat-Bodies.*—JOSEPH BOWDEN and ROBERT SHAW, Marple, assignors of one-half of their right to WILLIAM WILSON, Newcastle-on-Tyne, Great Britain.

A series of parallel elliptical rolls rotate in contact with and "work" or knead the hat retained between them. An intermittent reciprocating motion imparted to the bearings of the upper rolls raises the latter periodically to allow the hat-body to be placed or withdrawn.

Claim.—1. The combination, in a felting-machine, of a series of oval or elliptical rollers, arranged and acting substantially as and for the purposes hereinbefore set forth.

2. The lever *t* fitted with a screw, t^3, and a sliding weight, *w'*, and connected with the bearings of the upper roller, to which a vertical reciprocating motion is imparted, substantially as and for the purpose herein before set forth.

3. The combination, with the roller *g*, of the lever *n'* and cam *q'*, or equivalent self-acting mechanism for effecting the periodical separation of the rollers, substantially as and for the purpose hereinbefore set forth.

135,400.—*Combined Mop and Mop-Wringer.*—JAMES L. BOYDEN, Bridgeport, Conn.

A case or cylinder combined with a mop, which serves as part of the handle to the mop, and also holds the wringing device, and acts in connection therewith in wringing the mop.

Claim.—1. The combination of the case C with the plates or pressers E and the rod E', substantially as and for the purpose specified.

2. The case C, the neck of which is supplied with the angular projections *c c*, as and for the purpose described.

3. The combination, with a mop, of the case or cover C, which receives and holds the mop-brush during the wringing of the latter, for the purpose of assisting in expelling the water therefrom, substantially as shown and described.

4. The rod A, mop-brush B, case C with the plates E and rod E', hollow handle D, and handle F, combined substantially as and for purpose specified.

135,401.—*Cultivator.*—BYRON C. BRADLEY, Chicago, Ill.

Claim.—1. The parts A and B, constructed substantially as shown and described, and used in connection with a cultivator or plow beam and standard, substantially as and for the purpose herein specified.

2. The parts A B, beam E, and standard F, in combination with the piece or washer D and bolt, the several parts being constructed and arranged substantially as and for the purpose described.

135,402.—*Lock for Freight-Car Doors.*—WILLIAM S. BREWSTER, Chicago, Ill.

The spring-catch is applied to the inner side of the car-door, and is held in the locked position by means of the engaging spring, which enters an opening near the end of the catch. The bit of the key serves, when turned, to force the engaging spring out of contact with the catch and then engages with a ward upon said catch, so that by pulling the key the catch will be withdrawn.

Claim.—1. In combination with the spring-catch D provided with the post E, or its equivalent, and one or more wards, *d*, arranged as described, the spring *b* engaging the catch, substantially as and for the purpose specified.

2. The sliding plate I and perforated pin J arranged upon the case F so as to cover the key-hole and admit of being sealed, substantially as specified.

135,403.—*Corn-Harvester.*—HENRY M. CARTER, La Fayette, Ind.

Two upright boards, with forward projections at their lower ends, have a gate at their rear to receive the cut corn in an upright position, from whence it is periodically delivered by means of a foot-lever and connecting-rods.

Claim.—1. The combination of the retaining-gate I I, lever F, connecting-rod *g*, and foot-piece C.

2. The combination of the bracing-rods *a b*, the collar A, and the vertical bar L, by which the height of the cutter-bar and platform or apron M may be regulated.

135,404.—*Steering-Propeller.*—JAMES L. CATHCART, Washington, D. C.

A propeller-shaft with propeller attached is supported at its outward end in a bearing at the lower end of a vertical curved crane, and its inner end is sustained by a vertical shaft protruding above the deck, and is connected to the power-shaft by a universal joint. The shaft is moved laterally to any angle with the line of the ship's motion by arcs on the top of vertical shaft and actuated by chain fastened to said arcs, and extending around sheave on rudder-head.

Claim.—1. The slotted forks $d\ m^4$, on the ends of the propeller and engine shaft *m o*, and pins $d^2\ d^3$, by means of which the propeller and its shaft can readily be unshipped, substantially as described.

2. The slotted forks $d\ m^4$, in combination with the cross-piece a^1 provided with sliding boxes *v v*, substantially as described.

3. A laterally-adjustable propeller mounted in a frame, substantially as shown, so that it may be securely held at any desired angle with the line of motion of the vessel, as described.

4. The rudder-head provided with a sheave, e^4, and chain e^5, in combination with the radial sector-arms $m^5\ m^5$, perforated cap a^7, screw-bolt b^5, and nut n^4, substantially as and for the purpose described.

5. The detachable head e^6 provided with a grooved arc, n^4, substantially as described, for the purpose set forth.

6. A detachable crane for supporting screw-propellers made in two parts, and constructed to operate as set forth.

7. The vertical shaft *b*, constructed substantially as described, and provided with removable cap c^{10}, in combination with the propeller shaft *m*, substantially as and for the purpose specified.

8. The crane *h*, constructed as set forth, in combination with the vertical shafts *a b*, propeller B, and shaft *m*, substantially as described.

9. A propeller-shaft provided with a nut and key, or its equivalent, near its outer end, in combination with the propeller and after bearing of the propeller-shaft, whereby the propeller-hub and said after bearing are held together and obstructions thereby prevented from entering between them, and the frame kept from spreading or breaking, substantially as described.

135,405.—*Breech-Loading Fire-Arm.*—MARTIN J. CHAMBERLIN, Springfield, Mass.

The firing-pin is withdrawn within the breech-block upon opening the same, and the breech-block is readily manipulated and securely locked in place.

Claim.—1. The longitudinally-moving bar *f*, and cam *a* operated by the lever E, whereby the locking-brace *d* is moved from beneath the breech-block, and the breech-block moved down by the same movement of the said lever, substantially as described.

2. The longitudinally-moving bar *e* and cam *a* operated by the lever E, whereby the fire-pin *s* is forced back and the breech-block moved down by the same movement of said lever, substantially as described.

3. The pin *b*, in combination with the cam *a*, when operated by means of the lever E, all constructed and operating substantially as and for the purpose described.

4. The fire-pin *s* having thereon the projection *o*, in combination with the sliding bar *e*, whereby the said pin is forced back by suitable mechanism operating against said bar, substantially as described.

5. The pin *b* having combined therewith the cam *a*, the extractor *c*, and the finger *c'*, all substantially as and for the purpose described.

6. The combination of the lever E, pin *b*, cam *a*, bar *f*, and locking-brace *d*, all substantially as described.

7. The combination of the lever E, pin *b*, cam *a*, bar *e*, and fire-pin *s* having the projection *o* thereon, all substantially as and for the purpose set forth.

135,406.—*Die for Making Wrench-Heads.*—LUKE CHAPMAN, Collinsville, Conn., assignor to THE COLLINS COMPANY, same place.

The head is formed wholly by upsetting and swaging the end of a bar of the dimensions required for the shank. The bar is held by the dies, with its end protruding into a cavity, and the plunger being forced into the die from the opposite end staves up the metal, spreads it outward against the walls of the cavity, and thus gives proper shape to the head.

Claim.—1. The partible dies A and B, in combination with the plunger D, when constructed and designed for use substantially as described, for the purpose set forth.

2. The process of forming a head upon the end of a wrench-bar by means of the partible dies A and B and the plunger D, when operating substantially as described.

135,407.—*Self-Closing Faucet.*—MILFORD S. CLARK, New York, N. Y., assignor to CHARLES HARRISON, same place.

The handle is fixed upon a swivel, and when located it may be locked by a cap-screw. A hollow stem has a duct leading from the variable chamber to the induction and eduction passages, with two lateral openings, one smaller than the other.

Claim.—1. In a self-closing cock, a hollow valve-stem provided with openings f^2 and f^3, respectively, above and below the cap-leather *g*, when arranged with relation to the induction-passage A, substantially as described, and for the purposes set forth.

2. The combination of the swivel *i* and the ferrule *d* with the shell of a faucet or cock, substantially as described, and for the purpose set forth.

135,408.—*Buck-Saw Frame.*—WILLIAM CLEMSON, Middletown, N. Y.

The brace is formed of a square bar of iron twisted.

Claim.—The buck-saw frame above described, composed of end pieces A A, bar A', strain-rod *c*, and twisted brace or braces C, constructed and combined substantially as shown.

135,409.—*Driving-Belt.*—WALTER R. COLTON, Syracuse, N. Y.

The belt is made of flat sections of metal, which are hinged or pivoted together. A wooden V-shaped lug is secured to each link or section by a band of iron passed around it, the ends of the band being fastened to the link by screw and nut, or otherwise.

Claim.—1. A jointed belt, composed of flat metallic sections A, each provided with a V-shaped wooden block, C, rigidly attached, substantially as herein shown and described.

2. The combination of the metallic sections A, wooden blocks C, and adjustable bands *c*, all constructed and arranged substantially as herein described.

135,410.—*Reversing-Link-Motion Engine.*—THOMAS L. CROWLEY, Parker township, Butler county, Pa.

The link of the engine is pivoted and operated by chains or ropes connected thereto at top and bottom, and passing over sheaves or pulleys. The chains are connected at the other end to a lever, which may be held stationary by a screw.

Claim.—1. The link C of a steam-engine, in combination with the ropes or chains $C^1\ C^1$ and lever B *b*, arranged to operate substantially as specified.

2. The elements enumerated in the first claim, in combination with the clamping devices composed of the bars $d\ d^1$ and screw d^2, substantially as and for the purpose specified.

135,411.—*Inhaler.*—WILLIAM H. CUTLER, Buffalo, N. Y.

A roll of bibulous paper composed of small tubes is inserted in the ordinary glass tube forming the body of the inhaler. Sponge has been usually employed as the vehicle to carry the inhaling remedies, but under the action of some of the powerful medicaments the sponge loses its porosity in a great measure.

Claim.—A core, C C', for inhaling instruments, formed of a tube or tubes of bibulous paper or analogous material, as specified.

135,412.—*Turbine Water-Wheel Bucket.*—SAMUEL L. DENNEY, Gap, Pa.

This bucket is adapted to ride, as it were, upward on the current, thus relieving the pivot from friction and wear.

Claim.—The detachable turbine-bucket B, consisting of the front wall *a* curved downwardly and rearwardly to form the bottom, and the inner wall *b* curved upwardly and outwardly at *c* to form the top, said curvature *c* being varied according to the weight of the wheel and the head of water, substantially as specified.

135,413.—*Machine for Cutting and Bending Hoops.*—JACOB DOBBINS, Litchfield, Mich.

The bolt from which the hoops are cut is caught by the projections on reciprocating the bar and forced by the cutters and into the feed-rolls.

Claim.—The shaft G, gear H, crank *e*, pitman I, bar J, latch-button K, and spring *g*, constructed, arranged, and operating with relation to the knives D E substantially in the manner described, for the purpose specified.

135,414.—*Corn-Cultivator.*—IRA EMRICK, Vernon, Mich.

The standards and beam of adjustable and reversible cultivator-shovels are secured by means of a round cross-bar, a staple, and eyebolts, which may be easily loosened for purposes of adjustment.

Claim.—The described method of securing the standards and beams together by means of the cross-bar I, eyebolt K, and staple J, as and for the purpose set forth.

135,415.—*Manufacture of Brushes.*—ALANSON C. ESTABROOK, Florence, Mass., assignor to THE FLORENCE MANUFACTURING COMPANY, same place.

The bed or under piece of the mold or flask is constructed with a concavity to receive the form of the face of the brush with the bristles protruding. The second piece of the mold holds the form of the brush through which the bristles are passed and held in place. The third piece has an opening, through which the brush in form is passed with the bristles set. The fourth piece is then placed over the projecting bristles and the molds filled with the plastic substance when limpid and forced in contact with the bristles, after which the cap or fifth piece of the mold is added and the mold filled to form the handle and connect it with the brush-head, and the entire brush formed, after which the mold is separated by the device G and the brush taken out.

Claim.—1. The combination of the base-piece A and the plate B, with their recess and projections, and holes *i b*, for placing, holding, and giving penetration to the bristles, substantially as described.

2. A die, mold, or former, for making brushes in, composed of the members A B C D, acting together in the manner and for the purpose described and represented.

3. In combination with the die, mold, or former for making brushes in, the piece G, with its projections *n n*, for separating the parts A B from those C D, for the purpose of taking out the finished brush, substantially as described.

4. In combination with the die, mold, or former, and the piece G for separating them, the band or ring H for holding together the two parts that contain the brush, as and for the purpose described.

135,416.—*Machine for Making Dowel-Pins.*—CHARLOTTE EVERTS, Girard township, Erie county, Pa., administratrix of MARTIN EVERTS, deceased.

The bar H, operated by the pulley and crank, drives the stock against the knife and thence through the dowel-cutter.

Claim.—The machine composed of the frame A, pulley and crank B C, connecting-bar F, slide H, knife K, and cutter L, all constructed and operated substantially as and for the purpose hereinbefore set forth.

135,417.—*Toy Block.*—HENRY FAIRBANKS, St. Johnsbury, Vt.

Jointed blocks form toy-wagon frames of different patterns.

Claim.—1. The within-described toy composed of rectangular blocks A, each having circular mortises B and corresponding circular tenons *c*, adapted to notch together in varied relations, substantially as herein specified.

2. In combination with the toy blocks A having round tenons *c*, the round blocks $A^1\ A^2$ having central holes, and adapted to serve therewith, as herein specified.

135,418.—*Slide for Extension Tables.*—GEORGE FINKBEINER, Syracuse, N. Y.

The face of one of the wooden slides has two parallel grooves and a metallic strip extending the entire length of the slide and projecting over each groove. On the face of the other slide two U-shaped hooks are secured that engage over the respective edges of the strip secured to the first-mentioned slide.

Claim.—The combination of the metallic ribs *b* and hooks *c*, of U-form, as described, with the slides A, substantially as above specified, and for the purposes set forth.

135,419.—*Peg-Rasp.*—JEREMIAH W. FOARD, San Francisco, Cal.

The cutter is made detachable from the stock, and a bend in the stock protects the screw which fastens the cutter.

Claim.—The combination of the stock A with its bend B, follower F and its appropriate screw, and the cutter S, substantially as set forth and described, and for the purposes stated.

135,420.—*Smoke-Burning Furnace.*—SAMUEL A. FORD, Chicago, Ill.

A number of perforated chambers, placed in the rear of the grate-bars, are supplied with air and steam from the boiler, to assist in burning the smoke.

Claim.—1. The hot-air chamber D and pipe J, in combination with the perforated chambers F, constructed and arranged substantially as described, and for the purposes set forth.

2. The combination of the perforated chambers F, hot-air chamber D, air-pipe J, and steam-pipes G and H, arranged substantially as specified and shown, and for the purposes set forth.

135,421.—*Speaking-Tube.*—CHRISTIAN A. FREDERICKS, New York, N. Y.

A plate or piston at the end of the speaking-tube, just above the mouth-piece, is connected by a wire with an external plate, so as to indicate to the eye, by its position, when the tube has been blown into from the opposite end.

Claim.—1. The indicator composed of the plate I, rods J J, and plate K, in combination with a speaking-tube, substantially as shown and described.

2. The arrangement of the indicator and valve in the L-shaped terminus of a speaking-tube, substantially as shown and described.

3. The guards G H, in combination with the shaft F, upon which is fixed the valve E, substantially as shown and described.

135,422.—*Hot-Air Furnace.*—JACOB FRIDLEY, Jr., Carlisle, Pa.

Claim.—1. In a hot-air furnace, a series of simple hot-air tubes, B B, &c., in combination with a radiator through which the products of combustion circulate, passing around such air-tubes, substantially as described.

2. The combination of a tubular radiator, through which the products of combustion circulate, and cylinder D D, inclosing a

fire-place, A, and a hot-air chamber, C C, between said radiator and cylinder, substantially as and for the purpose set forth.

135,423.—*Governor.*—MERRITT GALLY, Rochester, N. Y.

A conoidal or curved-face pulley is connected by belts or friction-gear with pendulous governor-balls, and so arranged in its motions and relation to said balls, as regards their several planes, as to secure at all times a constant and invariable velocity of the pulley-shaft, no matter how much the speed of the balls may vary.

Claim.—1. In combination with the revolving pendulum or governor balls A A and shaft F, the curved-face or conoidal wheel Y, substantially as and for the purpose specified.

2. The method described of connecting the governor-balls and conoidal wheel, and securing the point of attachment correspondent at all times with the plane of said balls, by means of the several devices constructed and arranged substantially as herein set forth, for the purpose of converting a variable into an invariable velocity.

135,424.—*Shirt.*—OSCAR GOWING, Boston, Mass.

The bosom is larger than the opening in the body of the shirt which receives it, so that there is a fullness at the sides of the bosom which may be folded down smooth, but when the body of the wearer is bent the bosom may expand by the fullness and thereby prevent wrinkling.

Claim.—1. A shirt-bosom so constructed as to be capable of distension or expansion on the one hand and of contraction and folding upon the shirt-front on the other hand, substantially as and for purposes stated.

2. The employment of the lapels or wings C C or their equivalents as a means of attaching the bosom of a shirt to the front of the latter, substantially as and for purposes stated.

3. The patterns as shown by diagrams in Fig. 3 of the drawing.

135,425.—*Combined Cradle and Rocking-Chair.*—EPHRAIM HAMBUER, Detroit, Mich.

The chair has but one end or arm, and is provided with a hinged back that folds down on the seat when the chair is pushed into the frame of the cradle.

Claim.—The chair D, provided with the hinged back, in combination with the fixed cradle A, the chair D being adapted to slide into the cradle when the back is turned down, as described.

135,426.—*Steam-Pump.*—JOHN W. HANDREN, Jersey City, N. J.

Combines a single steam-pump with a double-cylinder engine having a small and large cylinder with suitable valves, so as to change it from a compound engine to a double engine.

Claim.—1. The arrangement of the valves F J *t* with suitable means of operating them relatively to each other and to the two cylinders d D and pump B, adapted to allow the steam portion of the machine to be changed at will from a double engine to a compound engine and back again, as herein set forth.

2. The cylinders *d D* with valves and operating mechanism, constructed substantially as described, in combination with a single pump-cylinder arranged to be operated thereby, as herein set forth.

135,427.—*Loom for Weaving Slats, Window-Shades, &c.*—EMORY B. HASTINGS, Palmer, and WILLIAM E. NICHOLS and WARREN L. MERRITT, Templeton, Mass.; said HASTINGS and NICHOLS assignors to said MERRITT.

To guide the stripe and insert them into the shed without injury to the warp, the lay is provided with a slot into which the stripe are fed by rollers, and also with a reciprocating cop which is stationary thereon while the strip is passing into the shed, but is moved upward at the beat of the lay to allow the strip to be released and to be placed in the fabric before the succeeding shed is made. The cutting device consists of two horizontal bars carrying near the ends the cutting knives, the upper bar having a vertically-reciprocating movement, being lifted, for the introduction of the slat under it, by the action of the lay, and falling by its own weight so as to trim both ends of the strip at the same time.

Claim.—1. The lay K, with its slit *e*, in combination with the sliding cap M and inclines *o o*, operating substantially in the manner and for the purpose set forth.

2. The cutting devices consisting of the stationary bar N and movable bar O, constructed and arranged as described, in combination with the lay K having the incline *p* for raising the bar O, substantially as and for the purpose set forth.

135,428.—*Hat-Pressing Machine.*—EMORY B. HASTINGS, Palmer, and JASON DRAPER, Barre, Mass.

The rigid dies are clothed with rubber padding, and are operated by a system of toggle-levers.

Claim.—1. The combination of the cross-head R, cross-tail T, rods Q, toggle-levers S S, pitman V with the rods or ways I I, crank-shaft W, gear-wheel X, clutch-collar *b*, pinion Y, and pinion-shaft *a*, for transmitting motion and pressure to the reciprocating die G, as shown and described.

2. The rigid male die G, having its entire surface covered with one or more thicknesses of India rubber, H, or other elastic material, for equalizing the pressure upon the hat, for operation in connection with a female die, D, substantially as set forth.

3. In combination with a female die, D, and the rigid die G with its elastic covering H, the patches *k n*, substantially as and for the purpose set forth.

135,429.—*Telegraph-Pole.*—CHARLES F. HOWES, Philadelphia, Pa., assignor to himself and MILARD W. HOWES, Boston, Mass.

Two uprights, meeting at the top, are strengthened by tension-wires which are held apart by struts. The uprights, which are made of angle-iron, pass through a base band to the stone or foundation below. Supporting-strips also join the base band to the foundation. Bands or rings having projections for holding the tension-wires apart are placed at intervals along the pole.

Claim.—1. A telegraph-pole formed of two or more uprights or strips, A, of iron, steel, or wood, supported or strengthened by tension-wires attached to the pole and held apart by struts G, or their equivalents, and arranged in relation thereto, substantially as described.

2. In combination with two or more uprights, A, of a telegraph-pole, bands or struts G having projections H, substantially as described.

135,430.—*Fruit Jar.*—HENRY HOWSON, Philadelphia, Pa., assignor to SALMON B. ROWLEY, same place.

The fruit-jar is formed with a spiral groove sunken into its neck, and terminating at a point above the packing, leaving thereby a cylindrical portion between such packing and the termination of the thread over which the screw-cap passes. The thread of the cap is also discontinued for a distance above its lower edge, leaving a plain cylindrical portion which embraces the cylindrical portion of the neck of the jar, and thereby isolates and confines the rubber packing in such a manner as to produce a perfect joint.

Claim.—1. A fruit-jar having in its neck a sunken thread terminating at a point above a shoulder, *c*, and a plain cylindrical portion between the two, substantially as described.

2. The combination, with the said neck, of a cap, B, having an internal thread discontinued above the lower edge of the said cap, leaving below the thread a plain cylindrical portion, as specified.

135,431.—*Wax-Thread Sewing-Machine.*—WILLIAM H. JOHNSON, Springfield, Mass.

The several parts of the machine are operated from one crank by diverging connecting-rods, one of which is connected with a vertically-sliding bar connected at bottom with the needle-lever, and the other with a similar bar connected at top with the awl-operating lever. Projecting from this last slide-bar is an arm that enters a slot in a bar connected with and operating the rock-shaft that vibrates the pivoted frame in which the needle and cast-off slide, and movement of this frame causes the needle to move the material for a new stitch.

Claim.—1. The combination of the driving-crank, the diagonal connecting-rod, and the slide, with the lever that works the awl, substantially as described.

2. The combination of the driving-crank, the diagonal connecting-rod, and the slide, with the lever that works the hook-needle, substantially as described.

3. The combination of the diagonal connecting-rods and the slides that work the awl and hook-needle, respectively, set obliquely to each other and actuated by the same crank, substantially as described.

4. The combination, with the hook-needle, of the rocker-shaft P, or its equivalent, when it is actuated by the mechanism that carries the awl, as described, so that it will feed the material along while the hook is in the material, substantially as described.

5. The combination, with the presser-foot, of the lever R, and spring S, as described, so that the spring will be raised from the presser-foot without raising the foot, substantially as described.

6. The adjustable block U, in combination with the lever R and the stud T, operating substantially as described.

135,432.—*Canteen.*—RICHARD KELLY, Red Bank, Cal.

The canvas sack with openings at each upper corner. In one is placed a filtering-sack through which the water is passed and strained or filtered and the foul matter retained in it, which, by means of a cord attached to it, can be raised out of the sack and cleared of the foul matter, and then be returned to it for further use.

Claim.—The canvas sack or canteen A with its filtering-sack C, in combination with the strings *d h*, substantially as and for the purpose above described.

135,433.—*Box for Preserving Cake and Bread.*—ALBERT R. LEDOUX, Cornwall Landing, N. Y.

A tin box or receptacle, constructed with a box attached to its bottom to hold a wet sponge, over which is placed a perforated plate through which the moist atmosphere from the sponge passes to the bread or cake placed upon it, and preserves it from drying.

Claim.—The combination of the pan C to receive a moist sponge, and the perforated plate D to support the articles to be kept moist, with the box A B, substantially as herein shown and described, and for the purpose set forth.

135,434.—*Wheel for Vehicles.*—HARMON B. LECKENBY, Kalamazoo, Mich.

Mortises and tenons are dispensed with.

Claim.—1. In combination with said spokes, secured by keys D, the holding-rings E, provided with studs or lugs *b*, as and for the purposes described.

2. A wagon-wheel wherein the hub A, metallic band B, spokes C, keys D, holding-rings E, and metallic flanges F are arranged and constructed to operate substantially as and for the purposes set forth.

135,435.—*Dentist's Stool.*—ISRAEL W. LYON, Brooklyn, N. Y.

The stool is adjustable both in height and inclination; in height by means of the rod affixed to the seat and the tubular support having a serrated lever to engage in a groove in the rod, and an inclination by means of a "ball-and-socket clamp joint," arranged preferably near the bottom of the standard.

Claim.—The tubular support or leg C, rod H with seat K, ratchet-lever F, weight G, or its equivalent, ball B with double-conical aperture *b b*, washer D, nuts E *c*, and base A, combined substantially as and for the purpose set forth.

135,436.—*Car-Stake Supporter.*—WILLIAM H. MASTERMAN and WILLIAM T. HOOPER, Stockton, Cal.

The stake being withdrawn from the socket, one end is secured by a projecting metallic plate which is fastened to its lower end, falling within a latch-plate which is secured by the side of the socket. The lower end is also secured by a chain, which is attached at one end to the projecting plate and the other end to a staple in the car. The other end of the stake is supported by a pin fastened to the side of the car.

Claim.—The standard C, with its downward-projecting plate *e*, when secured to the car-body by a chain, F, in combination with the latch-plate A and supporting-pin *i*, substantially as and for the purpose above described.

135,437.—*Automatic Relief-Valve for Steam Fire-Engines.*—ALVARADO MAYER, Detroit, Mich.

The relief-valve has a balanced piston playing in a cylinder above the relief-valve, which is placed at the end of a hose-gate, and has in connection therewith an adjustable pressure-gage actuating an equilibrium-valve through an intermediate lever and certain connecting-pipes, all arranged to prevent the hose from bursting by undue pressure.

Claim.—1. In pumping-engines, the combination of a relief-valve with an adjustable pressure-gage and valve, substantially in the manner shown and described.

2. In pumping-engines, a relief-valve H, having a piston, I, of greater area secured to its stem, but working in a separate cylinder, and so arranged as to keep the relief-valve closed by the pressure of the fluid upon both, in connection with independent valves *m S p* for relieving the piston from pressure, when the pressure under the relief-valve exceeds a given limit, substantially as shown and set forth.

3. The device described, consisting of water-way D', cylinders F F' separated by the diaphragm *a*, relief-valve H, stem H', piston I, return-pipe J, equilibrium-pipe K, chamber L, equilibrium-valve M, pipe N, chamber O, pressure-valve P, spring *c*, adjustable pressure-gland *f*, waste-pipe Q, chamber R, waste-valve S, stem S', and equalizing-lever T, arranged as shown and described, and for the purposes set forth.

135,438.—*Feed-Water Heater for Locomotives.*—EDWARD MOYER, Wyandotte, Kans.

Into a water-tight shell attached to the straight portion of a smoke-stack water is forced directly from the pumps, and is here partially heated by the waste heat passing up the stack before it is conveyed to the boiler.

Claim.—The stack A having the jacket B about its straight portion only, induction-pipes C C, and eduction-pipe D, the latter being arranged to deliver one-half of the water to each side of the boiler, as described.

135,439.—*Horse-Power.*—JOSEPH MÜLLER, Nacogdoches county, Tex.

Power is transmitted from several driving-pulleys in different directions horizontally, and from as many points vertically, at one and the same time.

Claim.—The improved horse-power herein described, when constructed, arranged, and operated as described, for the purposes specified.

135,440.—*Cupboard and Extension Table Combined.*—BENONI F. PARTRIDGE, Syracuse, N. Y.

A cupboard, the back and front having horizontally-hinged doors which, when let down, form tables.

Claim.—The combined cupboard and extension table, constructed substantially as herein shown and described, the leaves of the table folding up to form the front and rear of the cupboard when closed.

135,441.—*Shingle-Machine.*—HIRAM PEAVEY, Bangor, Me., assignor of one half his right to MICHAEL SCHWARTZ, same place.

The feed-table receives motion from the cam through a yoke and lever, thus giving a slow forward movement with a quick return.

Claim.—1. The combination of the carriage B, yoke *l*, and double cam *j*, constructed and operating substantially in the manner shown and before described.

2. The combination with the above of the friction-wheel *d* and connecting mechanism, substantially as set forth and described.

135,442.—*Refrigerating Cupboard.*—JACOB H. POLHAMUS, Albany, N. Y.

A double-walled cupboard is provided with an ice chamber at its base.

Claim.—The double-walled cupboard, constructed as described, provided at its base with the ice-chamber, as and for the purpose specified.

135,443.—*Machine for Making Spools.*—JOHN F. C. RIDER, South New Market, N. H.

A series of operations are performed by the machine, consisting of turning the blanks for the spools, cutting them off, dressing the ends and stamping them, boring the spools, and cutting the recess to receive the thread.

Claim.—1. In combination with mechanism, substantially as described, for supporting and advancing the stick, (viz., the stationary rests C *m'*, and the movable poppet B, and its operative mechanism,) the circular saw M, the series of rotary receivers D E F G, the boring mechanism, (viz., the stop-shaft *n*', and the boring tool *g*', and its operative mechanism,) the mechanism for dressing the ends of the blank, (viz., the rotary cutter-heads *f' e'* and their operative mechanism,) and the mechanism for reducing such blank circumferentially, (viz., the arbors *s' s''* and the carrier T, provided with a cutter and mechanism, as described, for operating them as explained,) the said saw and rotary receivers being provided with mechanism for operating them, essentially as set forth.

2. In combination with the combination or mechanism herein first claimed, one or more retainers, U U' U'' U''', arranged and applied in manner, and for the purpose, and provided with mechanism for operating it, as set forth.

3. In combination with the combination or mechanism herein first claimed, mechanism as described, or its equivalent, for stamping the ends of the blanks, such consisting of the stamping-heads *s' g'*, arranged and provided with operative mechanism, as described.

4. In combination with the mechanism herein first claimed, the series of inclined guides *s''*, arranged relatively to the rotary retainers D E F G, substantially as set forth.

5. In combination with the mechanism or spooling-machine herein first claimed, and as arranged therewith, the machine for rounding the stick preparatory to its introduction into the said spooling-machine.

135,444.—*Machine for Shaping the Elastic Dents of Combs for Looms.*—SUSANNAH ROBINSON, Accrington, England, administratrix of MATTHEW ROBINSON, deceased.

The wire passes from the reel to a bed, on which there is a frame having at the top a slide carrying two bowls and at one side two vertical bearings and boxes. These are made to operate, through suitable mechanism, the levers employed for bending and shaping the dents, which levers describe arcs corresponding in length to that required in the dents. At the outer extremity of each there is a pin and projection. When the lever is being turned the pin seizes the wire and bends it, when it passes behind a pin on a lever having an incline, which was depressed by the projection on the lever. The bends are nipped at each end by nippers operated by suitable mechanism and in connection with the pins on their respective levers. The dents thus shaped are drawn forward automatically and wound on a spindle.

Claim.—The levers A and B, carrying the arms *a'* and *b'*, in conjunction with the nipping-levers *e'* and *f'*, when mounted and operated substantially as and for the purpose described.

135,445.—*Setting and Sewing Ruches.*—MARCUS ROGGENBURGER and SIGMOND ROGGENBURGER, Philadelphia, Pa.

The central portion of the material to be formed into a ruche is pressed into the slot in the slotted plate B by the slotted clasping-strip, and this strip is confined to the slotted plate by bolts. The presser-foot has a tongue on its under side, which enters the central slot in the slotted strip and guides it in its proper course as the plate is moved by the feeding device which engages its under side, covered with rubber or other equivalent material. The enlarged toe of the presser opens the folded material to allow the passage of the needle.

Claim.—1. The slotted clasping-strip E, in combination with the slotted plate B and devices for holding the strip and plate together, substantially as described.

2. The presser-foot I having a tongue, *e*, and its front end rounded, in combination with the slotted strip E, substantially in the manner and for the purpose set forth.

135,446.—*Loom-Shuttle.*—CALEB K. SAWYER and GEORGE F. WRIGHT, Clinton, Mass.

To produce a shuttle, both light and strong, for weaving wire fabrics. The sides are of rawhide and these are firmly attached to end pieces made of wood. The cop of wire is hollow and the thread is delivered from the interior. To prevent the kinking of the wire a spring friction device is arranged to act upon the inner walls of the cop, which is held in position by spring-jaws.

Claim.—1. A shuttle made in whole or in part of rawhide, and having combined with it a cop of wire and tension mechanism, substantially as and for the purpose herein set forth.

2. The friction device consisting of box or disk *b* provided with spring-wires *a a*, and used in combination with a hollow cop, substantially as and for the purpose herein set forth.

3. In combination with the above, the spring-jaws *d d*, as and for the purpose set forth.

135,447.—*Grate-Bar.*—JAMES A. SINCLAIR, Bridgeport, assignor to himself and MATTHEW C. MCKROWS, Barnesville, Ohio.

The grate-bars are made with upwardly-projecting lugs having intervals between them, and either cast with bars or detachably bolted thereto.

Claim.—The right-angled lever F *f*, the parallel bearing-bar D centrally pivoted at *s'*, and the grate-bars C pivoted at their front ends and sliding at their rear ends, all arranged as shown and described.

135,448.—*Harrow.*—CYRUS SMITH, Irwin's Station, Pa.

The plows are arranged to throw right and left, and can be changed for ridging or marking.

Claim.—1. The arrangement of the teeth E, constructed as described, and applied to the frame A B C, provided with adjustable wheels K K K, and wide hitching-head D, when constructed and arranged as and for the purpose set forth.

2. In connection with the above, the plows M M attached to the removable bar F and to the harrow-frame, constructed as shown and described, and operating as set forth.

135,449.—*Heating-Stove.*—SAMUEL SMITH, Philadelphia, Pa.

The stove-cylinder, base, and grate-supporting plate are firmly secured in position.

Claim.—1. The annular plate C with its lugs *c'* and nutted screw-bolts B or their equivalent fastenings, in combination with the flange *a'''* of the base A for the purpose of adjustably securing the sheet-metal body D to the cast-iron base A of a stove, substantially in the manner and for the objects hereinbefore set forth.

2. In combination with the annular plate C the grate-supporting arm *c''*, substantially as and for the purpose hereinbefore described and set forth.

135,450.—*Anchor.*—WILLIAM WASTENEYS SMITH, Newcastle-on-Tyne, England.

An anchor having its arms journaled on the outer ends of a solid cross-head at the crown end, and swinging independently of each other, said arms provided with horns which assist the flukes in taking the ground. The arms have shoulders which bear against the crown-piece for the purpose of relieving the strain on the points of support.

Claim.—An anchor, constructed substantially as described, having the arms journaled on the outer ends of a solid cross-head at the crown end, and swinging independently of each other, said arms having horns which assist the flukes in taking the ground, and are provided with shoulders which bear against the crown-piece to relieve the strain on the points of support, as and for the purpose set forth.

135,451.—*Ratchet-Drill.*—JOSIAH SWANK, Delano, Pa.

A tooth near the center of a pawl, pivoted on a short arm, engages with a ratchet-wheel on the lower end of a sleeve, from the top of which the screw is fed. A cam, fixed to the stock above the arm on which the pawl is situated, raises the tooth from the ratchet and allows it to engage only once in each revolution of the drill.

Claim.—1. The hooked arm *f* and clamp *o* in combination with the cam *m* for regulating the feed, substantially as shown and described.

2. The sleeve *e* having the ratchet *d*, the hooked arm *f*, tooth *h'*, clamp *o'*, and arm *g*, in combination with the cam *m*, substantially as shown and described.

3. The tube *t* and screw *s* in combination with the sleeve *e* having ratchet *d*, constructed and arranged substantially as shown, for the purpose set forth.

4. The combination of the arms *h g*, hooked arm *f* having tooth *h'*, tube *t* having ratchet *n*, and sleeve *e* having ratchet *d*, substantially as described.

5. The sleeve *e* having ratchet *d*, cam *m*, hooked arm *f*, and arm *g*, or their equivalents, in combination with the ratchet-drill.

135,452.—*Straw or Mill Board.*—JUDSON L. THOMSON, Syracuse, N. Y.

Claim.—As an article of manufacture, straw or mill board coated with a colored size, either with or without a water-proof coating, as and for the purposes set forth.

135,453.—*Automatic Safety-Lock for Elevators.*—GUSTAVUS C. TEMPE, New Orleans, La.

Two levers working in longitudinal slots in the guides, and operated by a spring giving equal pressure to each for clutching the guide-posts of the elevator.

Claim.—The combination and arrangement, in a hoisting-cage or elevator-platform, of the above described safety-locks, clamp-brakes, or guides F, when arranged and operated to work to and from a center in common, substantially as set forth, and for the purposes described.

135,454.—*Elevator.*—GUSTAVUS C. TEMPE, New Orleans, La.

A hoist-rope running over and embracing two drums; also, a counterpoise weight, so that when the platform or counterpoise reach either their highest or lowest limit of travel the hoist rope is instantaneously slackened on the drums, which continue to revolve.

Claim.—1. The combination and arrangement of the pinion-wheels B on the driving-wheel shaft with geared wheels C, drum C', and gear-wheel D and drum D', the whole arranged and operating in connection with the hoist-rope or cable of a cage or platform, substantially as described, and for the purposes set forth.

2. The combination of the driving-wheel A with annular flange A', double brakes G G, rods V V, and inverted T-lever H, all constructed substantially as described, and for the purposes set forth.

3. The combination and arrangement of the inverted T-lever H with the double-ended lever I, trip-cords K and L, and weight W, all constructed substantially as described, and for the purposes set forth.

4. The combination and arrangement of the worm P, lever F, and ball J, with the shaft R, all constructed substantially as described, and for the purposes set forth.

135,455.—*Gas Apparatus.*—HENRY H. WAINWRIGHT, Philadelphia, Pa.

Two chambers containing dilute sulphuric acid, each communicating, through a valve at the bottom, with a generating-chamber containing a quantity of scrap metal supported upon a grating. A pipe, so arranged that at the time the gas commences to generate it may be opened to allow the air contained in the generating-chamber to escape. After the air has been entirely ejected the pipe is closed, and the gas then generated is allowed to pass through a branch pipe and radial arms into a hollow perforated ring, which is immersed in hydrocarbon, where it is discharged. Two evaporating-pans are so arranged that the contents of either chamber may be withdrawn and evaporated.

Claim.—1. A gas apparatus in which two acid-chambers, A and A', are combined with a single generating-chamber, E, containing a quantity of metal scrap, all substantially as and for the purpose specified.

2. The shelf or grating *b* arranged within the generating-chamber in respect to the openings provided with valves, and leading to the acid-chamber or chambers, substantially as herein described.

3. The combination, with the generating and acid chambers, of slide-valves D, for the purpose specified.

4. The combination, substantially as described, with the chambers E and G, of the air-pipe F and gas-pipe F' communicating therewith.

5. The combination with the carbureting-chamber, of the pipe F', radial arms G, and hollow ring *h*, all substantially as specified.

6. The combination, with each acid-chamber, of an evaporating vat or vats, J, for the purpose specified.

135,456.—*Grinding, Scouring, and Polishing Machine.*—ALMERN B. WALTERS, Philadelphia, Pa., assignor to himself and CHARLES SAUNDERS, same place.

Claim.—1. The post B provided with the slide C, made adjustable by the rack and crank E, in combination with the jointed arm D and the operative mechanism, as and for the purpose specified.

2. In combination with the adjustable swinging and jointed arm D, the attachments G^1, G^2, G^3, and G^4, substantially as and for the purpose set forth.

135,457.—*Top-Plate for Cooking-Stoves.*—EDWARD R. WEHRLE, Pittsburg, Pa.

The several parts of the top-plate are held together by the united action of lugs on the under sides.

Claim.—The transversely-slotted or hooked lugs *a'*, the laterally-holding lugs *a*, and the under-lapping lugs *b b'*, combined and formed at the joints of a cook-stove top, which is formed of several sections, as herein set forth.

135,458.—*Potato-Digger.*—JOHN S. WRIGHT and IRA BENEDICT, Palmyra, N. Y.

Friction-rollers are placed upon the standard of each plow to bear off the vines. The fingers upon which the soil and potatoes fall when leaving the share are given a vertical motion by means of a lever and crank-wheel, by means of which the potatoes are separated from the soil.

Claim.—1. The rollers F, when combined with the standards of the plows of a potato-digger, substantially as and for the purpose set forth.

2. The agitator I, in combination with the lever J, connecting-rod O, and crank-wheel N, as and for the purpose set forth.

135,459.—*Turbine Water-Wheel.*—PIERCE W. YARRELL, Garysburg, N. C.

An improvement on the wheels patented to the same inventor March 29, 1870, No. 101,402, and March 14, 1871, No. 112,667, consisting in suspending the wheel from the hemispherical case or dome, said case being provided with chutes projecting inwardly; also, in the application of a double-band gate operated by a pinion and ratchet, which separates the bands and permits the impact of the water first upon the apex of the V-shaped buckets.

Claim.—1. The dome-shaped case A formed or provided with the series of internal chutes, as set forth, and supporting a shaft, D, carrying a turbine-wheel, substantially as described, for the purpose specified.

2. The double band-gates provided with gear-teeth, and arranged upon the outside of the case A, in combination with the pinion or spur wheel I', rod J, and a series of chutes, substantially as described.

3. The bands *f g* arranged upon the buckets at the bottom and top of the wheel F, so as to c eate the intermediate space or entrance *e*, substantially as and for the purpose specified.

4. The turbine-wheel F suspended by the dome G from the end of a vertical shaft, D, which has its bearing above the wheel, substantially as described.

5. The dome G, in combination with U or V shaped buckets M N and bottom and top coverings or bands *f g*, substantially as described.

6. In a turbine-wheel, the dome G, wheel F, and annular chamber P, in combination with U or V shaped buckets, a series of chutes, and a double-band gate, substantially as described.

135,460.—*Wood Pavement.*—MARY H. ALEXANDER, Newark N. J.

Claim.—A paving-block, sharpened on the lower side and notched on one of the upper corners, as described.

135,461.—*Stop for Sewing-Machines.*—DAVID S. ALLING, Albany N. Y., assignor of one-half of his right to PETER C. LANDER same place.

A pivoted eccentric which allows the wheel to revolve in one direction but checks it in another.

Claim.—The combination of the cam D, or its equivalent, constructed and pivoted as described, with the arm A and stop E, or equivalent, as described, substantially as set forth, for the purpose specified.

135,462.—*Hoe.*—HARRY R. BARNES, Rock Stream, N. Y.—Case B.

A hoe constructed in triangular form has the handle attached at the center. Two sides of the hoe are made with plain cutting-edges, while the third side is constructed with corrugated teeth which stand at an angle to the face.

Claim.—A triangular hoe of concave form, when constructed with the plain edges *a a* on two sides, and the projecting teeth *c c* on the third, as herein shown and described, and for the purpose specified.

135,463.—*Gate.*—JESSE ELINN, Rockford, Ill.

The gate moves on rollers, and is operated by chains, a vibrating arm, and a rock-shaft. The gate is held in a vertical position by friction-rollers and a clamp engages with a groove in the top rail. Track-clearers serve to remove snow or other obstructions from the rails.

Claim.—1. The combination, with the gate, of the rock-shaft F, vibrating arm F', chains *f*, friction-roller *b*, and clamp c^3 engaging with a groove in the rail of the gate, substantially as and for the purpose set forth.

2. The combination of the track-clearers c^1 c^2 c^3 with the gate E, substantially as described.

135,464.—*Harrow.*—HIRAM CARTWRIGHT, Owatonna, Minn.

A harrow, constructed in two sections, is attached to a draw-bar by the center-beam of each section, and is further attached by rods which pass through the draw-bar and back to a bolt on the inside of each section.

Claim.—The described means for connecting two sections of a double harrow, consisting of the bar C, center-pieces B B, and rods D D, arranged and applied as set forth.

135,465.—*Sewing-Machine Chair.*—FRANKLIN CHICHESTER, Milwaukee, Wis.

The back posts are recessed to admit of a curved spring in each. Stops are affixed to the pivoted back that strike against the curved springs, and thereby adjust the inclination of the back. The inclination of the chair is made adjustable by means of curved bars arranged under the seat, having a series of notches in the upper edges, said notches receiving a sliding bolt that is attached to the spider-arms on each side of the chair. The chair-frame is pivoted to said spider.

Claim.—1. The combination of the springs J and stops K with the recessed back-posts H and pivoted back I, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the arms *e'*, pawls or latches E, and notched curved arms or bars F with the cross-bar or spider C and seat-frame D, substantially as herein shown and described, and for the purpose set forth.

135,466.—*Device for Transmitting Power.*—JOHN C. CLINE, Philadelphia, Pa., assignor of one-half his right to ALLEN MIDDLETON, Jr., same place.

The driving-shaft of a steam-engine is connected to a swinging frame carrying a revolving shaft that is provided with a fly-wheel, and a gear-wheel connecting with a gear-wheel on the driving-shaft. Said fly-wheel shaft is combined with vertical oscillating rods by means of crank-pins extending from arms of the shaft or the side of the fly-wheel, so that as the said crank-pins turn in their bearings in the upper ends of the oscillating rods, and the shaft in its bearings in the swinging frame, a very easy movement is given to the crank in the up-and down movement of the swinging frame, whereby they are carried freely over the dead points.

Claim.—The combination of the revolving shaft F, provided with one or more fly-wheels and with crank-pins *b b*, with the driving-shaft C by means of gear-wheels, and with oscillating rods H H and the frame E, having an oscillatory movement on the driving-shaft, substantially as and for the purpose set forth.

135,467.—*Machine for Pointing Pickets.*—ALPHEUS B. CORBY, Binghamton, N. Y.

The picket is placed upon an oscillating carrier, thus allowing a partial rotation while under the cutting-knife, which gives a rounded contour to the end of the picket.

Claim.—The grooved and inclined holder D, secured at one end to the base A by means of a screw-bolt, in combination with the knife-lever B pivoted to the raised part of the base, all as shown and described, whereby said holder may be adjusted at various horizontal angles to the knife-lever, as and for the purpose specified.

135,468.—*Curing Tobacco.*—JAMES D. CULP, Gilroy, Cal.

Claim.—The process of curing tobacco, as herein described, consisting of hanging the tobacco till it yellows, piling it in the usual manner, subjecting it to fermentation until the starch is turned to saccharine matter, and subsequently drying it, substantially as set forth.

135,469.—*Paper-Box.*—MOSES W. DILLINGHAM, Amsterdam, N. Y.

On the outside of the box near its upper edge, at the ends, strips are secured. On the inner edge of the cover are secured blocks or strips that spring over the strips on the box and hold the lid in place.

Claim.—The combination, with body A and cover B, of the pasteboard pieces *c d e*, constructed and arranged as and for the purpose set forth.

135,470.—*Hub for Vehicles.*—HOWARD M. DUBOIS, Philadelphia, Pa., assignor to himself and W. FILTER, same place.

Claim.—A wooden hub having annular groove B turned in at the center with sloping sides, combined with the two-part metallic side-beveled mortise-ring C having spoke-mortises D and transverse ribs G, and with the outer metallic ring I having large mortises K and transverse grooves L, as and for the purpose described.

135,471.—*Stove-Grate.*—SAMUEL DUNCAN, Syracuse, N. Y., assignor of one-half his right to JOEL D. OWEN, same place.

Claim.—A grate composed of a conical central section surrounded by one or more conical rings, each of which slopes substantially at the same angle and in the same direction as the central section, when said sections are so arranged that the upper surface of each section falls a little below that of the surrounding section, and when they are so combined that each section may be shaken separately, if desired, substantially as above described.

135,472.—*Harness-Maker's Gage.*—DEWITT G. GARLOCK, White Cloud, Kans.

A sliding bolt attached to the gage-bar holds the gage-head in rigid position when adjusted to cut the width required.

Claim.—The gage-head E, combined with the screw F, swiveled in cutter-head B, and provided with the perforated finger-wheel I J, and the gage-bar having slotted sliding bolt K, arranged as and for the purpose described.

135,473.—*Railway-Tank Feeder.*—AUGUSTUS GROCHAU, Duluth, Minn.

The track-platform is supported on eccentrics, which, through the levers, enable the lead to be gradually placed upon the piston, which forces the water up into the tank.

Claim.—The combination, with a vertically-movable railroad-platform, floating piston, water-tank, and pipe F, of the lever M, eccentrics I, shafts K, cranks L, and rod N, arranged and applied as and for the purpose described.

135,474.—*Ice-Cream Freezer.*—GEORGES GUINOT, Milton, Fla.

The ice-tub is provided with a false bottom and frame for supporting the annular ring near its top; also, with a disk which revolves upon a pivot affixed to the said false bottom. The cream-holder is provided with suitable scrapers within, which are arranged so as to remain stationary while the holder is being revolved; also, with studs upon its bottom to engage with the apertures in the disk while the same is being used, and serve as legs when removed from the ice-tub.

Claim.—1. An ice-cream freezer, composed of the tub B, rotary disk *b*, revolving cylinder A, cog-wheels *f h*, and stationary scrapers *m m* on the stationary rod E, all arranged to operate substantially as herein shown and described.

2. The cylinder A, provided with downwardly-projecting pins *d*, which enter cavities in the bearing-disk *b*, as specified.

135,475.—*Excavator.*—JOEL T. HAM, Liberty, Ind.

The scoop-frame is attached to the main frame by a pivot at the rear, so that the scoop can be driven from the rear instead of being drawn from the front. The scoop-frame, which also supports the front elevator, is movable on a vertical center in order to allow lateral adjustment of the scoop and elevator. The scoop is hinged to the front end of the frame and is adjusted vertically by the screw T, while the transverse adjustment is effected by the shaft and chains. The point of the scoop is removable for repairs, and it also has a colter for tough or strong soil. The rear apron is reversible so as to throw the dirt to either side of the machine, the pivot on which it oscillates being hollow to allow the passage of the operating-shaft.

Claim.—1. In an excavator, the arrangement of the frame P, to which the scoop-shaped plow S is attached, on a rear center-pin, *v*, so that the plow may be driven from the rear, substantially as herein set forth.

2. The pivot *w* with ball-joint for securing the scoop to its support, substantially as herein set forth.

3. The parallel rods W W and the standards *s' s'* to which they are attached, constructed and arranged substantially as and for the purposes herein set forth.

4. The arrangement of the frame Z, crank-shafts *c'*, ropes or chains *f'*, and pulleys *h'*, substantially as and for the purposes herein set forth.

5. The combination of the frame L with the gearing upon it for driving the forward apron K, pivoted as described, and the truck N moving upon the tram-way O, all substantially as and for the purposes herein set forth.

6. The tube A, arranged as described, for supporting the swinging frame H for forming a bearing for the shaft *f*, and for holding the adjusting-cam *n*, substantially as herein set forth.

7. The overhanging apron G and the reversible frame H that supports it for the purpose of elevating the dirt and delivering the same at right angles to and at either side of the carriage, substantially as herein set forth.

8. The combination of the adjustable bar I with arms *m m* and pinions *k k* and the stationary cam *n*, constructed and arranged substantially as and for the purposes herein set forth.

9. The frame B', with shafts *i' i''* and *m'*, having suitable ratchets and ropes connecting with the overhanging apron-frame, substantially as and for the purposes herein set forth.

10. The movable point *w'*, constructed as described, and provided with bar *p'* and wings *s'*, substantially as and for the purposes herein set forth.

11. The curved colter C', forked at its upper or rear end and its front or lower end attached to the removable point *w'*, substantially in the manner and for the purposes herein set forth.

135,476.—*Device for Burning Petroleum.*—FREDERICK A. HULL, Beloit, Wis.

Petroleum is fed into a furnace by means of a hollow cylinder provided with perforations at both ends, and made to reciprocate in a tube connecting the tank and the combustion-chamber.

Claim.—In combination with the tank A and furnace or combustion-chamber B, the hollow cylinder C', provided with perforations *c c'* and made to reciprocate in the connecting-tube C, substantially as and for the purpose set forth.

135,477.—*Adjustable Journal.*—MOSES JACKSON, Bevington, Pa.

Claim.—The combination, with the parts C D, of the tubular stem E and bolt F having reverse screw-threads, the conical chambered sleeve A, and washer G, as shown and described.

135,478.—*Shirt-Bosom.*—CHARLES W. JENKS, Somerville, Mass.

The upper half of the bosom only is attached to the shirt-body, the lower half being left free.

Claim.—As an improved manufacture and my invention, a shirt on which the lower half or portion of the bosom is unattached to the shirt-front, except by the upper portion or rest of the said bosom being sewed or connected at its edges to the front, all being substantially as shown and described.

135,479.—*Needle Setter, Threader, and Cutter.*—ALLEN JOHNSTON, Ottumwa, Iowa.

The needle is set so that its eye comes opposite the bowl, and it may be easily threaded by passing the end of the thread through the bowl. After the needle is threaded the bowl is turned up, and then the cutter extends below the pivot of the arm and in position for the operator to cut the thread when desired.

Claim.—1. The pivoted arm or plate A, provided at one end with a needle setting and threading bowl, at the other end with a thread-cutter, and adapted to be applied to the head of a sewing-machine, to operate substantially as shown and set forth.

2. A combined needle-setter, needle threader, and thread cutter, composed of an arm or plate carrying at one end the setter and threader, and at the other end the cutter, in combination with a jewed clamp, to which said arm is pivoted, the parts being arranged and adapted to operate substantially as shown and described.

135,480.—*Harvester.*—CHRISTOPHER LIDERS, La Fayette, Ind., assignor to himself and R. JACKSON, same place.

Grappling-rakes suspended from a crane over the platform are, by means of cams on the main axle and intervening mechanism, caused to grasp the grain on the platform, lift it, convey it to the rear, discharge it and await the accumulation of another gavel, and return to their first position to repeat the operation.

Claim.—1. The combination of the rake, the crane, and the mechanism for operating and closing the rake, a grain-platform pivoted to the truck-frame of the machine, with the cams and tappet on the truck-axle, and the arms and stirrups of the crane, and rake-actuating rod, all substantially as specified.

2. The combination of hollow crane-shaft, oscillating arm H, vertically-moving rod G, cam Q, and arm R, arranged substantially as specified.

3. The combination and arrangement of the oscillating arm H, rakes M, rods O O′, and the stationary arm P, substantially as specified.

4. The combination of the rod *i*, stationary arm *j*, and springs *k* with the crane-shaft C and cams *a′* and *b′*, substantially as specified.

5. The arrangement of the cams *a a′*, *b b′*, and arms *d e* of the crane-shaft, the tappet S and stirrup X of the rod G, and the axle of the truck, substantially as specified.

135,481.—*Binder's Stand and Table for Harvesters.*—WILLIAM R. LOW, Sandwich, Ill.

The binder's stand and tables are hinged to the frame of the machine so that they may be folded up thereon to pass obstructions in going from field to field.

Claim.—The binder's table B pivoted through slots *c c* to the frame A of a harvester, the foot-board E pivoted to the frame A as at *e e*, the jointed rods *f f*, and the rigid vertical rods *g g*, all combined and arranged substantially as specified.

135,482.—*Machine for Grinding Emery.*—HERMAN S. LUCAS, Chester, Mass.

Within a long upright cylinder is arranged, longitudinally, a shaft, upon which is secured the grinding apparatus, consisting of a number of cams with corrugated surfaces.

Claim.—The combination of the cylinder A, shaft B, and cams C either with or without the corrugated shoes *s* attached, all constructed and operating substantially as described.

135,483.—*Cooking Utensil.*—JOSEPH MANSFIELD, Jefferson, Wis.

The opening in one side of the supporting plate has a flanged aperture fitted for the ordinary pot-hole. Over this the gridiron can be placed. The hood above operates to retain the heat and cause the cooking fumes to be diverted into the fire.

Claim.—The gridiron-case, consisting of the plate A and cover B, with the parts all connected and made substantially as herein shown and described.

135,484.—*Tube-Cutter.*—EDWARD MANUEL, Milwaukee, Wis., assignor to himself and GEORGE GUT, same place.

The tube and spindle are held together by means of a groove and screw, and power is communicated between them by means of a ratchet connection regulated by a spring.

Claim.—The combination, with the spindle C, provided with the groove *b* and wrist-pin *c*, and the slotted case B having teeth *g*, of the ratchet cap D, feather *j*, spring *i*, cutter A, and screw *d*, to operate as shown and described.

135,485.—*Cotton-Gin.*—ORRIN MURRAY, New Market, N. H.

The cotton is fed upon a table and thence over wire fingers to the lower edge of the adjustably-held and inclined reciprocating knife, which descends past the edge and concave side of the stationary blade, the cotton being inducted by the surface of an endless apron in rear of the blade, said apron being made of several thicknesses of cloth united by a caoutchouc preparation, and thickened and fortified inside at its edge by pegged leather strips, which move in depressions near the ends of the two cylinders upon which the apron moves, the upper of these cylinders being hollow—all automatically operated.

Claim.—1. In a machine for ginning cotton, the hollow roller F, when constructed with the open space b^{5}, neck b^{6}, shoulder b^{4}, and openings b^{3} in the neck, substantially as and for the purpose described.

2. The endless feed-belt C′, constructed of five or more thicknesses of cloth cemented together with rubber, and having the interior projecting leather edge pieces *a* attached thereto by cement and pegs, in the manner substantially as and for the purpose described.

3. The adjustable stripper E, constructed, in the form shown in Figs. 4 and 5, with a convex face, *e*, and arranged to fit nearly upon the concave rear side *c′* of the presser-bar F, substantially as shown.

4. The combination of the endless feed-belt C′, constructed as described, and having its interior projecting edges *c′* thereon, with the rollers B′ and C, constructed and arranged to operate substantially as described.

135,486.—*Cotton-Press.*—ROBERT POWERS, Charleston, Miss.

To reverse the motion of the nut the adjustable pinion is moved to engage alternately with the pinions K on the counter-shaft.

Claim.—The combination, with the revolving nut C and pressscrew B, of the counter-shaft H, driving shaft I, pinions K, and the adjustable pinion L, substantially as specified.

135,487.—*Blackboard-Eraser.*—WINFIELD S. READ, Oakland, Cal.

The cushion of the eraser is covered with "corduroy" or other ribbed material.

Claim.—1. A blackboard eraser having a surface composed of ribs and grooves, substantially as and for the purposes described.

2. An eraser having a face covered with corduroy or similar material over a soft cushion of wadding and carpeting, or similar material, substantially as shown and described.

135,488.—*Combined Tobacco-Box and Match-Box.*—CHARLES REMHOF, Brooklyn, N. Y.

Claim.—As a new article of manufacture, the sheet-metal box, partitioned for the reception of the drawer, said drawer having a retaining check, and the hinged sides of the box being braced by said partition, substantially as described.

135,489.—*Hand Corn-Planter.*—LEWIS H. RICHARDS, Rising Sun, Md.

A narrow strip of wood, hinged at the middle, slides on the back of another piece, and, being pivoted at the bottom near the periphery of a seed-cup disk, causes it to partially revolve in the bottom of a hopper attached to the front strip. The latter is extended below the disk, for the purpose of penetrating the ground.

Claim.—The slide E F combined with bar B, wheel C, hopper A, and stirrer G, as and for the purpose described.

135,490.—*Device for Pitching Boats.*—WILLIAM H. RICHARDSON, Stillwater, Minn.

A portable receptacle for pitch, tar, white-lead, &c., has hollow perforated pipes or tubes connected with the reservoir, with brushes or swabs on their outer extremities for pitching the seams of vessels, &c.

Claim.—The brush N, having hollow perforated handle, combined with discharge-tubes J K K of pitch-vessel A, as and for the purpose described.

135,491.—*Wagon-Brake.*—ROBERT ROBERTS, Dubuque, Iowa.

The pressure of the load upon the rear bolster of the wagon applies the brakes by means of bell-crank levers and connecting-rods, and the draft upon the tongue releases them by like means.

Claim.—1. The combination of the bolster D, cranks *b b*, shaft *d*, rods *i i*, and brake-bar G, all constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The perforated plate H attached to the axle A, in combination with the rods A A attached to the bolster D, substantially as and for the purposes herein set forth.

3. In combination with the rocking-shaft *d* connected with the brake-bar G, the crank *m* and connections *n p s* to connect with a sliding double-tree on the slotted tongue K, substantially as and for the purposes herein set forth.

135,492.—*Belt-Fastening.*—THEODOR RUDIGER, Carver county, Minn.

The hinge clamps the ends of the belt between its two sides, and an inwardly-turned-up edge prevents the ends of the belt from drawing out.

Claim.—The combination and arrangement of lips or wedges D with clamps A and B, provided with pivotal bars *b* and E, substantially as shown, and for the purpose described.

135,493.—*Bee-Hive.*—H. PETER SIMMONS, Paterson, and ALBERT J. KING, Hudson, N. J.

The suspended frames are notched centrally at the bottom, and thus straddle an edged beam that rises from the floor, which is also notched, to prevent the frame from vibrating. The top moves horizontally on rollers, which sink into depressions at their place of rest; thus, when moving, it does not crush the bees.

Claim.—1. The combination of the rollers G with the top B of the hive and the bars D provided with recesses for the same, for the purpose of locking the top in its normal position, and raising it off the base when it is to be moved laterally, as shown and described.

2. The strip M secured to the central elevated portion of the bottom board J, in combination with the bottom bars N of the comb-frames, said strip and bottom bars being provided with bevel-notches, as and for the purpose specified.

3. The recesses R and S formed by cutting away the top of one side of the part A and the other by cutting away the lower edge of the top B on the opposite side, whereby said top may be moved over the comb-frames, and allowed to drop into place without injuring the bees, as set forth.

135,494.—*Game Apparatus.*—AMOS M. SMITH, Chicago, Ill.

Claim.—The child's-game apparatus, consisting of a table with guarded sides, at one end of which is placed an imitation cannon, arranged to propel, by a spring contrivance, a ball of rubber against figures of soldiers and their commanding officers placed at the other end of the table, and counted of different values according to their rank, substantially as specified.

135,495.—*Finger-Bar for Harvesters.*—CHARLES A. SMITH, Napa, Cal.

The guard fingers have angular shanks, which are clamped in grooves in the finger-bar by means of a metal plate screwed thereon.

Claim.—The combination and arrangement of the grooved finger-bar A with the clamping-plate B fastened to the bar with screws, so as to clamp the guard-fingers D D in the grooves of the finger-bar and hold them firmly without other fastening.

135,496.—*Flour-Bolt.*—GEORGE T. SMITH and AARON SMITH, Minneapolis, Minn.

Bolt-case, in which is hung oscillating bolt, having bolting-cloth at bottom only, and furnished with brushes to keep same clean. Air is drawn by fan through bolting-cloth, carrying off light specks, bran, &c.

Claim.—1. The combination of the case A, provided with the air-inlets S, oscillating bolt-case B, shaft *b*, bolt-cloth *c*, air-tube H, and fan J, when said parts are constructed and arranged to operate substantially in the manner and for the purpose described.

2. In combination with an oscillating bolt, the shelf *f*, gates *i* and *m*, and spout *h*, substantially as and for the purpose specified.

3. In combination with an oscillating bolt, the belts V and brushes *s*, substantially as described, and for the purpose set forth.

135,497.—*Bolt-Cutter.*—JOSEPH TOMLINSON, Onslow, Iowa.

A sliding jaw is used under a fixed jaw, somewhat in the style of a monkey-wrench.

Claim.—1. The bolt-cutter, provided with L-shaped knives, as herein shown and described.

2. The combination of the lever E and straps *e e* with the shank A and slide C of the bolt cutter, all arranged to operate as herein shown and described.

135,498.—*Tire-Bender.*—JOSEPH TOMLINSON, Onslow, Iowa.

A central roller in vertical bearings, and two side rollers placed in hinged cheek-pieces. The vertical posts are elevated or depressed by a screw in the bottom of the frame, and the side rollers either brought together or spread apart, to allow a short or long bend to be made in the tire.

Claim.—1. The tire-bender composed of the hinged cheek-pieces B B, adjustable rollers D D, and movable roller E, all arranged in respect to each other as herein shown and described.

2. The subject-matter of the foregoing clause, in combination with the movable posts *b b* and screw *f*, for adjusting the instrument to produce circles of suitable size, as specified.

3. The laterally-adjustable rollers *g g* arranged in the hinged cheek-pieces B B of a tire-bender, substantially as herein shown and described.

135,499.—*Railway Snow-Plow.*—WILLIAM WALKER, Fort Bridger, Wyoming Ter.

The body of the plow is divided longitudinally into two sections, each being tilted by means of levers, so arranged that as the sections are turned the sides are opened and permit the escape of the snow. A check-plate is hinged to the forward part of the plow, which permits the snow to enter the body, but prevents it falling off in front.

Claim.—1. The side plates *f f*, hinged at their lower edges to the platforms D D, and operated by suitable devices, as shown and described, whereby said plates form chute-extensions of the platforms when the same are tilted, as specified.

2. The levers E E and bar F arranged in combination with the hinged sides *f* and platforms D to operate the same simultaneously, as specified.

3. The hinged check-plate G, arranged between the upright end projections *s s* of a snow-plow, substantially as and for the purpose herein shown and described.

135,500.—*Harvester-Cutter.*—WARREN WASSON, PHINEAS F. POWERS, and GEORGE W. DUNGAN, Genoa, Nev.

Two parallel bars, one in front of the other, tongued and grooved together, the front one having two pins projecting from its front upper surface at an acute angle with the upper surface of the plate, and the rear bar having a pin projecting at a corresponding angle rearwardly, by means of which the cutter-sections are attached and locked.

Claim.—1. A cutter-bar consisting of two parts, F R, sliding upon each other in opposite directions, and having studs f^{2} and studs r^{2}, respectively, as described, for the purpose of fastening the cutter-sections.

2. The detachable, apertured, and slotted cutters C, made with a slight transverse curve, as and for the purpose set forth.

3. The apertured lever E, having pin *b′* combined with heads f^{1} r^{1}, as and for the purpose set forth.

4. The bushing A, combined with heads f^{1} r^{1} and lever E, as and for the purpose set forth.

5. The slotted plate E, having a notch, *c*, at each end, combined with reversely-movable heads f^{1} r^{1}, undercut at each end, as and for the purpose set forth.

135,501.—*Clothes-Pin.*—WILLIAM WELLINGTON, Rockford, Ill.

The pin is formed with a single piece of wood, with a diagonal kerf extending through a greater portion of its length, having one leg longer and thinner than the other, a notch in the short leg for the line, and transverse gains on the outside of each leg.

Claim.—1. A clothes-pin having the outside of its legs flat, and provided with the transverse gains or notches *a′ b′*, substantially as and for the purpose set forth.

2. A clothes-pin made of a single piece of wood, with one leg longer than the other, and having a diagonal kerf, C, thereby adapting the shorter leg to receive the line-seat, and to have the throat-chamfer cut entirely upon it, substantially as set forth.

135,502.—*Glass-Mold.*—HORACE WICKHAM, Jr., Chicago, Ill.

Glass lamps and chimneys are blown with perforations or slots therein.

Claim.—A glass-mold with perforated or slotted walls, in combination with sectional segments, having corresponding projections for entering said apertures, all as and for the purpose set forth.

135,503.—*Turbine Water-Wheel.*—ANTHONY WERALSH, Springfield, Ohio, assignor of two-thirds his right to EDWARD GWYN and WILLIAM BURNS, same place.

The water is introduced horizontally through openings, which give it a proper direction and discharge it directly into the buckets on the periphery of the wheel and allow of its escape outside the said periphery into the tail-race. The wheel is secured firmly to the shaft, with buckets, cast or otherwise fastened thereon, and they form a double row arranged concentrically with each other, but having the entry thereto from the chutes arranged above and below each other. The gate-ring is constructed so as to fit the inner side of the upper part of the case or cylinder tight enough to exclude the water when closed. On the inner side of the gate-ring are cast other diagonal stationary guides or chutes, and together they guide and control the water to the edge of the buckets.

Claim.—1. The gate-ring *f* and the stationary guides G attached to the inside thereof, constructed substantially as described, and for the purpose set forth.

2. The outer case or cylinder C with the stationary guides E and openings M, constructed substantially as described, and for the purpose set forth.

3. In combination with the case C and gate-ring *f*, the wheel D with its duplex series of buckets *e* and *e′* arranged concentrically, and having their point of discharge outside the periphery of the wheel D, substantially as described, and for the purpose set forth.

4. The combination of the gate-ring *f* and the cylinder or case C for the purpose of forming a register-gate, when constructed substantially as described, and for the purpose set forth.

135,504.—*Earth-Closet.*—JOHN L. YOUNG, New York, N. Y.

Distributing-spouts are cut from a sheet-metal plate which forms the bottom of the reservoir, the center of the plate being cut away and the spouts formed as shown. Two rings, which are revolved on the bottom of the reservoir by means of pawls operated by the cover. Ratchet-notches being cut in the top edges of the ring, serve to convey the earth from the reservoir. The lower edges of the rings are cut and bent to form buckets.

Claim.—1. The distributing spouts F, arranged substantially as shown and described.

2. The combination of two rings, H I, rotated in reverse directions on bottom of reservoir and immediately over bucket, as and for the purpose described.

3. The means for rotating said rings in reverse directions, consisting of the ratchet-teeth on their top edges, the pawls and the cover, combined and arranged as set forth.

135,505.—*Show-Case.*—AUGUST ARNOLD and HEINRICH MERZ, Chicago, Ill.

The frame-bars are rabbeted so as to permit the glass to lie flush with the outside of the frame. The frame and edge of the glass is then covered with a double-headed "ogee" molding, with a flat plinth between the two heads; through this plinth the screws are driven that secure the molding to the frame, and are concealed by a half-round bead fitting between the heads of the molding.

Claim.—The rabbeted frame-bars A and moldings C C′, constructed and arranged as described and shown, for the purpose set forth.

135,506.—*Shaft-Bearing.*—GEORGE M. BALL, Green Point, Brooklyn, assignor to ISAAC HERMAN, New York, N. Y.

A stationary, perforated, conical collar, combined with a cone at the base of the shaft, and step-screw arranged to project up within an oil-box, in which said collar and the cone of the shaft fitting the collar are placed. On supplying oil to the box it passes through the collar and lubricates the whole step-bearing surfaces of the shaft.

Claim.—The combination, with the oil-box B, of the perforated conical collar-bearing E, the cone C of the spindle, and the step-screw D, substantially as specified.

135,507.—*Ventilator.*—GEORGE R. BARKER, Germantown, (Philadelphia,) Pa.

The hot-air register and the register for contaminated air to escape are arranged one above the other, and divided by a transverse inside partition between the two series of register air-valves. The hot-air register communicates with a pipe arranged within the chimney-flue, which connects with a suitable heating apparatus, whereby a single opening in the wall of the chimney-flue is

made to convey fresh hot air into the room, and of allowing the contaminated air to escape through a separate register near the floor.

Claim.—1. In combination with one or the same chimney-flue F, the hot-air register A and the contaminated-air register C in one frame, D E, provided with a transverse partition, B, between the said two registers, substantially as and for the purposes herein-before set forth and described.

2. In a combined hot-air and contaminated-air register plate or frame, the arrangement of the fresh hot-air register A immediately above the contaminated-air register C, substantially as and for the purposes herein-before set forth and described.

135,508.—*Slab and Siding Holder for Saw-Mills.*—JOSEPH BARSALOUX and GUSTAVUS A. PRESCOTT, Sandy Hill, N. Y.

Two curved dogs are arranged to clasp the log, and when in position are retained by a pawl and ratchet.

Claim.—The combination of the jaws A and B, lever C, and dog D, constructed and arranged substantially as and for the purposes herein set forth.

135,509.—*Earth-Auger.*—WILLIAM H. BEACH and CHANCEY N. HANSON, Hamburg, Iowa, assignors to themselves, H. F. WHITE, and W. W. SMITH, same place.

The frame of the auger is composed of the bent bar I and top cross-bar J. The removable half-cylinders are attached to the bar I by loops and hooks, and the loops are held on the hooks by levers pivoted on the bar J. The bottom is rigidly secured to the frame and has the usual cutting-lips on its under face and sides.

Claim.—The combination of the frame I J, bottom K with cutters *f f* having side cutters *h h*, the half-cylinders L L with eyes *l l*, the hooks *b b*, and angular levers *m m*, all constructed and arranged substantially as and for the purposes herein set forth.

135,510.—*Means for Operating Earth-Augers.*—WILLIAM H. BEACH and CHANCEY N. HANSON, Hamburg, Iowa.

The bevel-gear wheel is held in gear by a latch passing over a pivot, when it is desired to elevate the excavated earth, the gear-wheels thus affording connection between the rotating shaft and the sprocket-wheel which carries the elevating chain and bucket. When the object is merely to rotate the auger the latch is released and the parts are thrown out of gear.

Claim.—1. The combination, with the shaft D and its gear-wheel G, of the movable shaft *d* with wheels G' and H, and the centrally-curved hinged latch I, the frame A B C, and keeper *x*, all substantially as and for the purposes herein set forth.

2. The combination of the shaft *c*, drum K, and gear-wheel J, movable shaft *d* with wheels G' H, latch I, and the shaft D with gear G, all substantially as and for the purposes herein set forth.

135,511.—*Elevating Apparatus.*—MOSES A. BLAKLEY and JOSEPH CAHILL, Chattanooga, Tenn.

A revolving crane elevates a series of buckets from cars, which are drawn by the same rope that elevates.

Claim.—A swinging elevator, consisting of the mast B secured at head and heel, boom C C, rope-wheel *g*, and counter-weights L L with intervening ropes and sheaves, substantially as hereinbefore set forth, for the purposes specified.

135,512.—*Manufacturing Iron and Steel.*—OGDEN BOLTON, Jr., and JOHN PEDDER, Pittsburg, Pa.

Claim.—The method herein described of manufacturing iron or steel direct from the ore by the inclosure of the component parts in molds or tubes, submitting the same to the proper heat and "working up" the molds or tubes with the metal, thus preventing oxidation by protecting the metal from contact with the air, substantially as specified.

135,513.—*Hoisting Apparatus.*—JOSEPH N. B. BOND, New York, N. Y.

A tightening device is combined with an endless rope that runs over a differential pulley, and through sheaves connected to the tightening device, so that when the rope is moved by turning the windlass or by a direct strain, the tightening device rises with a slow and powerful motion, and vice versa, while the rope is always kept tight, or the tightening device acts as an automatic brake.

Claim.—The combination of a tightening device, J, with pulleys A B and an endless rope or chain, H, a sheave, L, and a drum, E, the whole being constructed and operating substantially in the manner herein shown and described.

135,514.—*Cheese-Hoop.*—GEORGE B. BOOMER, Syracuse, N. Y.

A cheese-hoop, the ring or cylinder of which is made in three sections, one being stationary and secured to the base and the others hinged to the first.

Claim.—In a cheese-hoop, the combination with a base, A, and with a section, C, permanently and rigidly fastened thereto, the two sections D E hinged to the rigid section C, as and for the purpose described and represented.

135,515.—*Apparatus for Turning Ovals.*—MYRON T. BOULT, Battle Creek, Mich.

The mandrel is supported at one end by a steady rest. The projecting end is provided with a grooved and slotted head, in which a plate carrying a small mandrel or chuck is placed. Two screws pass through the slots in the large mandrel-head into the plate, and serve to adjust the small mandrel on either side of the center.

Claim.—The adjustable slide C, with stud E or chuck I, (one or both,) in combination with head B, as arranged, and for the purposes set forth and described in accompanying specification and drawing.

135,516.—*Feather-Renovator.*—STEPHEN A. BOYETT, Grenada, Miss.

Claim.—The combination of the exterior chamber B and interior chamber B', revolving independent of each other, with the slide-valves *d*, hollow journals *a a'*, steam-space *b*, valve openings *f*, discharge-pipes *m*, and rotary fan shaft H, when constructed and arranged substantially in the manner and for the purpose herein set forth.

135,517.—*Car-Axle Lubricator.*—GEORGE A. BRANNAN, Baltimore, Md.

The roller by which the journal is lubricated is provided at each end with an elastic flange and also with flexible flaps.

Claim.—The lubricating-roller C, provided with flanges *c c* and flexible flaps *c'*, combined and arranged, in relation to a car-axle journal and its box, so as to operate in the manner and for the purpose specified.

135,518.—*Apparatus for Washing Printed or Bleached Goods.*—BENJAMIN G. BROOKS, Manchester, N. H.

The wears at the ends of the curved bottom regulate the height and velocity of the water which flows through the wash-box. The perforated partition renders the flow of the water uniform throughout the machine.

Claim.—1. A water box or tank containing two vertical partitions or wears parallel to each other and near to the opposite sides of the box, and having between them a concave bottom, G, as herein described, and for the purpose specified.

2. The combination of the double wears and concave bottom with the inlet and outlet pipes placed with reference to each other, as herein described.

3. In combination with a water-box having double wears and a concave bottom, the horizontal perforated partition K, the inlet-pipe N, and the outlet-pipe P.

4. The adjustable roller D, in combination with the beater G and a water-box, W, constructed as herein described.

135,519.—*Low-Water Alarm for Steam-Boilers.*—JOSEPH R. BROWN and WILLIAM A. FOSKETT, New Haven, Conn.

Pipes connect with a steam-boiler at different levels. Chamber E is ordinarily filled with water, but when the water in the boiler sinks below the end of pipe F the water in E is replaced by steam, melting the plug and allowing steam to pass through pipes to the whistle. As this steam is taken from a point considerably above the water-level, the whistle does not scatter hot water.

Claim.—In combination with the chamber E having the hollow tube B arranged therein, and a passage, C, communicating to the alarm, the water-tube F, steam-tube L, and the fusible material *a*, the said fusible material arranged in the hollow tube B, so as to close the steam-tube L, substantially in the manner described, and for the purpose specified.

135,520.—*Cutter-Head for Pointing the Ends of Bolts.*—ORRIN C. BUNDICT, Buffalo, N. Y., assignor to himself and RALPH PLUMB, same place.

On the face of the cutter-head are pivoted four clamps, each of which holds a cutter situated radially. These cutters are beveled at their inner ends, and are brought up against a rod placed between them to cut it off and bevel it by turning the inner ends of the pivoted clamps simultaneously.

Claim.—1. In combination with the cutter-head and rotating disk H or its equivalent, provided with pins A, the pivoted cutter-clamps C, capable of adjustment out of a radial line, substantially in the manner and for the purpose set forth.

2. The combination, with the cutter-head B and the pivoted clamps C, of the adjusting-ring H provided with pins *h*, and the operating-shaft I, substantially as and for the purposes set forth.

3. The combination, with the cutter-head B, pivoted cutter-clamps C, and central adjusting-ring H provided with toothed segment *k*, of the shaft and pinion I *i*, substantially as hereinbefore set forth.

4. The combination, with the cutter-head B, and pivoted cutter-clamps C, of the fastening-screws *g* passing through curved slots *f*, substantially as and for the purpose hereinbefore set forth.

5. The arrangement, with the cutter-head and adjusting central ring H, of the cutter stocks or clamps, so as to overlap the edge of said ring and retain it in place, as hereinbefore shown and described.

135,521.—*Corn-Planter.*—ALLEN C. BURGNER and GEORGE F. BURGNER, Charleston, Ill.

The feeding devices and check-row markers are operated, either separately or in conjunction, by means of a double clutch upon the shaft. The check-row markers are provided with springs and joints, which render them flexible, in order that they may conform to inequalities of the ground.

Claim.—1. In a seed-planter, the combination of a seed-dropper, check-row markers, and intermediate devices which connect the dropper and markers, and cause them to act simultaneously.

2. A seed-dropper and check-row markers connected together as stated in the first claim, in combination with gearing for imparting motion to the dropper and markers, and devices by which the connected dropper and marker may first be disconnected from the actuating-gearing and then be shifted, for the purpose set forth.

3. The shaft C I, seed-slide D, and markers K, in combination with the loose wheel F F', sliding clutch G, and gearing M N', substantially as and for the purpose specified.

4. The combination of the shaft C or its equivalent and markers K pivoted thereon, the joint being stiffened by springs, substantially in the manner and for the purposes specified.

135,522.—*Machine for Doubling and Twisting Silks.*—HENRY A. CHAFFE, Bridgeport, Conn.

The separate strands are led from the spools around tension-pulleys, which are all adjustable at once; around the pulleys of the cable-lay governor, which preserves the twist in the several strands; around the pulleys of the yarn carrier, which twists the strands together; around the drawing-pulley, and then to the flier or bobbin.

Claim.—1. The tension device L, consisting of the shaft, the pulleys, the sliding collars connected to the shaft so as not to turn, and the device for regulating the tension on several threads simultaneously and equably, the said parts being combined and operating substantially as described.

2. The stationary cable-lay governor M, applied between the tension device L and yarn-carrier G, substantially as and for the purpose set forth.

3. The combination of the cable lay governor M, a yarn-carrier, G, and a drawing pulley, J, substantially as described.

4. The combination of the tension device L, cable lay governor M, yarn-carrier G, and drawing-pulley J, substantially as described.

5. The yarn-carrier G, constructed with pulley-supports and open at one side, as described, and arranged relatively with the drawing-pulley J, substantially as specified.

135,523.—*Combination Lock.*—HENRY CLARKE, Baltimore, Md.

The hook or bolt is held in the locked position by an eccentrically formed toothed plate secured to a sleeve, within which sliding notched tumblers are placed, the said tumblers being supported by a stationary outer disk, through which they pass, and an inner annular plate, and operated by means of an outside movable bead fitted to the said sleeve, which bead serves to draw out the tumblers, when they can be properly adjusted, and rotate the eccentric plate for the purpose of locking and unlocking the lock.

Claim.—1. The movable eccentrically-formed toothed plate *b b*, sleeve B, tumblers *d d'*, and case A, relatively arranged substantially as herein described, for the purpose specified.

2. The case A and bolt E, in combination with the sleeve B, band C, disk D, and tumblers *d d'* having the pins *h*, substantially as and for the purpose herein set forth.

3. In combination with the tumblers *d d'*, the spring G, disk D, circular plate F, and washer H, substantially as herein shown, for the purpose specified.

4. The spring-hook I *m*, pivoted within the case at *k*, and latch K, in combination with the plate *b b'*, adapted to be made stationary or movable by means of the tumblers *d d'* operating with it, substantially as herein set forth.

135,524.—*Automatic Fan.*—CHARLES H CLARK, Hartford, Conn., assignor to himself, CHARLES H. LONGLEY, and NEHEMIAH A. DURHAM, same place.

The handle of the fan contains mechanism for automatically operating it while held in the hand, and may be wound up by pulling a cord depending therefrom.

Claim.—1. In combination with the spring F, the spool G and the ribbon H, substantially as described, for the purpose set forth.

2. The combination and arrangement, within the handle or stock A, of the helical spring J, screw-shaft K, sleeve and pin L *l*, speeding train N P Q Q', and the shaft C, substantially as shown, and for the purpose set forth.

135,525.—*Broom-Head.*—BENJAMIN C. COOK, Richmond, Va.

A broom with a metallic cap covering the heads of the corn, through which openings are made and staples introduced extending outside the cap, through which a wedge covered with metal is passed, to hold or secure the corn firmly in its place.

Claim.—The combination of the case A, having slots *b b*, the loops *d d*, caps E E, and wedges G G, all substantially as and for the purposes herein set forth.

135,526.—*Bale-Tie.*—FREDERIC COOK, New Orleans, La.

Claim.—The openings between the bars C and D made by splitting off the bars C from the bars D without loss of metal, and the lips turned on the edges of the said bars for the purpose of enlarging the openings, and thus making more easy the introduction of the bent ends of the bands.

135,527.—*Railway Switch.*—ALONZO W. CRAM, Litchfield, Ill.

The crank-shaft and signal-staff are separated. A disk is attached to the former, and both are rotated until one end of the slot strikes the horn of the signal-staff, by which the latter is also rotated until the end of horn strikes one end of the notch or slot *b* in plate B, thus giving the crank shaft a revolution of one hundred and eighty degrees and the signal-staff one of ninety degrees. Notched plate H is to lock the crank-wrist F and the connecting-rod G in proper position.

Claim.—1. The combination of the shaft E, crank F, and signal staff J, having unequal rotation, substantially as and for the purpose set forth.

2. The combination of the shaft E, crank F, fixed plate or disk B with indentation *b*, turning-disk C with slot *a*, and signal staff J with horn *f*, substantially as and for the purpose set forth.

3. The combination of the crank F and notched holding-plate H, substantially as and for the purpose set forth.

135,528.—*Machine for Making Cotton Laps.*—THOMAS C. CRAVEN, Hudson, N. Y.

The evener cylinder allows only a certain amount of cotton to pass over the apron to the feeding-cylinder. The speed of the apron may be varied, and the cotton taken from it by the feeding-cylinder is passed to the gin and thence to the lap-forming mechanism.

Claim.—1. The combination of the toothed feeding-cylinder N, the endless apron M, and the evener-cylinder Q provided with the retracting-fingers *g*, substantially as described.

2. The toothed feeding-cylinder, endless apron, and evener-cylinder provided with retracting-fingers, in combination with a cotton-gin provided with saws and a brush-cylinder, substantially as described.

3. In combination with the devices of the second clause, a lap-forming mechanism constructed and operating substantially as described.

135,530.—*Apparatus for the Manufacture of Sugar.*—SANTIAGO DON, Havana, Cuba.

Claim.—1. The generator composed of a number of connected boilers, in combination with the flues *b*, and dividing-wall *c*, the steam-pipes A, and safety-column H with its pipe *l*, substantially as herein described.

2. The combination of the trough *w* and discharge-pipe *n* with either or all of the boilers, essentially as and for the purpose herein set forth.

135,530.—*Shawl-Strap.*—THEODORE R. DUNHAM, Newark, N. J.

A shawl-strap is constructed with a canvass flap or cover having the buckles at one of its sides, the straps at the other, and the handle in the center. A ring is attached at each end of the handle for a strap with which to carry or sling a package over the shoulder.

Claim.—1. In a shawl or package strap, a ring, *d*, attached at or near each end of the handle for the attachment of a strap to carry or sling the bundle over the shoulder, substantially as herein set forth.

2. The within-described shawl-strap, consisting of the flap E, with the straps G attached to one edge and the buckles attached to the other, and with stay-piece D and handle A secured to the longitudinal center of the flap, all substantially as and for the purposes herein set forth.

135,531.—*Circuit for Chemical Telegraphs.*—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C.

Reverse-induced current from electro-magnets in branch circuit neutralizes residual or extra current in main line, and thus avoids blurs and "tailings."

Claim.—One or more electro-magnets, arranged in a local or branch circuit, substantially as set forth, in combination with a chemical telegraphic receiving instrument, for the purposes set forth.

135,532.—*Stock-Car.*—GILES A. EGAN, Covington, Ky.

The trough is divided into alternate feed and water sections. The sections intended for water have perforated bottoms. Water is introduced at one end of the troughs, and rises within each water-section to the same height.

Claim.—In the described connection with a cattle-car, the elevated water-tank E and trough I, the latter being divided and partitioned, as shown, to form alternate feed and water cells, substantially as and for the purpose specified.

135,533.—*Beater and Compressing Press.*—GEORGE ESTELL, Quincy, Ill.

The driving shaft revolves, rotating the wheel, the beater-rope being caught up by the mouth of the rim or base of the swell on the wheel and wound upon the outer vertical surface of the rim, thus elevating the hammer-block, which, when it reaches its maximum elevation is tripped, the rope slipping over the wheel and allowing it to fall.

Claim.—1. The driving-wheel N provided with the inclined rim *p*, block O, and lug P, substantially as shown and described.

2. The levers S *s*, rod *t*, and pawl *u*, in combination with the sliding collar S, substantially as shown and described.

3. The oscillating pulley-axle Z provided with the pulley-wheels *z*, for the uses and purposes substantially as shown and described.

4. The rotating collar F, driving-wheel N provided with the rim *p*, swell V, and lug P, in combination with the beater-rope R, vertical pulley-wheels *h*, *i*, and *h*, and hammer-block L, substantially as shown and described.

5. The rotating collar F, for the uses and purposes substantially as shown and described.

6. The combination and arrangement of the rotating collar F and sliding collar S, for the uses and purposes substantially as shown and described.

7. The sliding collar S, presser-rope T, oscillating pulley-axle Z, in combination with the levers U, substantially as shown and described.

8. The rectangular hinges D, arranged and operating in connection with the door C, substantially as shown and described.

9. The box-journal *x*, in combination with the hook at the end of bars W, substantially as shown and described.

135,534.—*Animal-Trap.*—SAMUEL F. ESTELL, Chicago, Ill., assignor to ANDREW W. KENDRICK, Brooklyn, N. Y., and HARRISON GIBSON, Richmond, Ind.

In any position of the trap, simple pressure of the trap-spring sets the trap.

Claim.—1. The spring F, catch K, and inclined portion V, combined for the purposes and in the manner substantially as set forth.

2. The spring F, catch K, and inclined portion V, in combination with the staples H and U and wires C D, trap A, hooks M and O, and wire N, substantially as set forth, and in the manner indicated.

135,535.—*Machine for Grinding and Polishing Stone.*—JAMES FINN, Boston, Mass.

Different thicknesses of stone can be polished at the same time. Each of the tools is provided with a separate spring for pressing it into contact with the slab, and the tool adjusts itself to the varying thickness accordingly. An automatic widthwise movement is imparted to the tool simultaneously with the movement lengthwise.

Claim.—1. The reciprocating carriage E, the tool-carrier bars *c c*, the slotted connector G, cranked shaft I, gear *r*, worm *w*, and shaft H, combined and arranged together and in the frame A, and relatively to the bed B thereof, substantially in manner as described.

2. The combination of each of the tool-forks *i*, its spring *l*, supporting-standard *h*, screw *m*, and nut *n*, all arranged as described.

3. The combination and arrangement of the above with the bar *c* applied to the carriage E, and provided with operative mechanism, substantially as specified.

135,536.—*Sewing-Machine.*—JOSEPH LEONARD FOLLETT, Troy, N. Y.

The cup-shaped shuttle-holder, provided with a projection to fit the concavity in the double pointed shuttle, is pressed forward, thereby engaging and pressing the shuttle against the annular race by means of a spring within the hollow driving-shaft which presses against the holder-shaft, fitted to slide within and to rotate with the driving-shaft. The shuttle may be moved in either direction. By conducting the thread from the outer or inner side of the shuttle the stitch made will have the needle-thread either simply locked with or twisted about the needle-thread.

Claim.—1. A double-pointed crescent-shaped rotary shuttle, having its center or axis of motion within its body, and pierced axially with a thread-hole, which extends from front to back, and communicates intermediately with the bobbin-receptacle, substantially as described, whereby the thread from the bobbin may be caused to pass out either at the front or back of the shuttle, for the purposes set forth.

2. In a shuttle of the kind described, in which the thread-hole is formed and arranged as specified in the preceding clause, a bobbin-receptacle extending entirely through the shuttle from front to rear, substantially as and for the purposes set forth.

3. The arrangement in the shuttle of the herein-described bobbin, tension, and bobbin-locking plates, substantially in the manner set forth.

4. The shuttle holder or cup and its supporting rod, in combination with the tubular rotary shaft, in which said rod fits and slides, and the check-nut and spring and adjusting-screw, for regulating the movement of said holder, the parts being constructed and arranged substantially as shown and set forth.

5. In combination with the shuttle-holder and devices for holding and operating the same, the annular plate toward which the holder is pressed, and between which and the holder the shuttle when in place is supported, substantially as shown and described.

135,537.—*Car-Coupling.*—FRANZ FOX and FRANCIS A. HOWARTH, Providence, R. I.

The draw-head is supported at the rear by adjustable hangers, to allow of the draw-head being raised or lowered to bring it in line with other draw-heads at different altitudes with which it is to be coupled. Two coupling-bars are employed, and each consists of a straight shank, with a flat head at one end and a bellically-shaped flat head at the other end. The heads of the coupling-bar enter the draw-head flatwise and are then turned by mechanism within so as to bring the shoulder of the coupling-bar at right angles to the mouth of the draw-head, and are held tightly thereby. The lever connecting with the turning mechanism being reversed releases the coupling-bar.

Claim.—1. The combination of the draw head and the coupling-bars, constructed and operating substantially as described, for the purpose specified.

2. The coupling-bar, substantially as described, in combination with the mechanism for turning and uncoupling the same, substantially in the manner specified.

3. The combination of the sliding connection B at the rear of the draw-head and the adjustable hanger H, substantially as described, for the purpose specified.

135,538.—*Machine for Shaping the Edges of Boot and Shoe Soles.*—CHARLES W. GLIDDEN, Lynn, Mass.

A series of heel-holding plates are formed around the periphery of a rotating wheel, between which heel-blanks are placed, and as the wheel revolves each blank is subjected to radial pressure from a plunger, which is raised or lowered by suitable mechanism provided.

Claim.—1. In combination with blank-holding plates *e f*, sliding dies, substantially as shown and described, for compressing the edges of the lifts and shaping and forming the heel-edge.

2. In combination with the sliding and shaping dies, the wheel having the series of heel-holding plates, arranged substantially as shown and described.

3. The combination of the rotating wheel *d* having the blank-holding plates, the stationary die-holder *i*, and its sliding dies *k*, and the follower, arranged and operating substantially as shown and described.

4. In combination with the wheel *d* and follower *n*, the ratchet *s* and drag-pawl *t*, substantially as and for the purpose described.

5. The method of shaping heel-blanks by subjecting their edges to the pressure of a series of dies, *k*, having faces which unitedly in the shape to be imparted to the curved heel-edge, substantially as described.

135,539.—*Lasting-Machine for Boots and Shoes.*—CHARLES W. GLIDDEN, Lynn, Mass.

The lasted boot or shoe is held securely by jaws provided upon their inner surfaces with elastic cushions, which, upon being compressed, force the upper against the side of the last, when, by a series of presser-slides located around an opening in a horizontal plate, into which the last extends, the projecting edge of the upper is pressed down firmly upon the inner sole.

Claim.—1. The combination of the block *b* having elastic faces, into which the last is pressed and the series of simultaneously-actuated pressers that press over upon the top of the inner sole the edges of the upper that are pressed up and held by the blocks.

2. In combination with the last-receiving mechanism the ring *i*, hinged substantially as shown and described.

135,540.—*Machine for Lasting Boots and Shoes.*—CHARLES W. GLIDDEN, Lynn, Mass.

The jack is provided with intermittent movement in combination with griping mechanism that seizes the projecting edge of the upper and presses it down upon the inner sole, where it is secured by nailing mechanism.

Claim.—1. In combination with a jack or shoe-supporting mechanism, the griping mechanism, substantially as shown and described, for intermittently seizing the upper and drawing it over the edge of the inner sole.

2. The combination, with such a griping and drawing mechanism, of the mechanism, substantially as shown and described, for fastening the edge of the upper to the inner sole.

3. In combination with the griping mechanism, a jack having an intermittent-feed movement, substantially as described.

4. In combination with the jack, the slide bar o^3, pawl-bar l^3, pawl-pin p^3, stud-pin l^2, slide m^3, and stud-pin l^3, operating substantially as described.

5. In combination with the griper-jaw the nail-carrier n^3 and nail-driver p^3, and the mechanism, substantially as described, for operating them.

6. In combination with the griping mechanism and nail-driving mechanism, the nail-tube m^3, substantially as described.

7. In combination with the griper-jaw *l* the cutter o^3, for slitting the upper.

135,541.—*Compression Basin-Faucet.*—WILLIAM GORDON, Philadelphia, Pa., assignor of two-thirds his right to ANDREW MCCAMBRIDGE and THOMAS KENNEDY, same place.

A compression basin-faucet constructed with vertical holes and pins for adjusting the nozzle, and a peculiar arrangement of opening and closing the valve, with its cylindrical longitudinal lateral openings, as described.

Claim.—1. The combination of the cap B, having a screw-socket, D, with the stem C, substantially in the manner and for the purpose set forth.

2. The combination of the cap B, having a screw-socket, D, and stuffing-box A, with the screw-stem C and packing-ring *i*, substantially as described.

3. The upper valve-seat *b'*, on the lower end of the screw-socket D, in combination with the upper valve E', substantially as and for the purpose set forth.

4. The annular chamber *d*, in the lower end of the screw-socket D, in combination with the cross-opening *s* of the valve-stem, substantially as described.

5. The combination of the screw-cap H, the ball G of the nozzle, having an annular space, *n*, and the screw-stem C, having a side-opening, *o*, substantially in the manner and for the purpose above set forth.

6. The combination of the openings *f* and pin *m*, with the upper end of the screw stem, and the ball G of the nozzle, substantially as described.

135,542.—*Cheese-Skipper Extractor.*—CALEB GREEN, Osseo, Mich., assignor to himself, SETH D. MCNEAL, and ALFRED M. GREEN, same place.

Air is exhausted from the vessel for a period of twenty-four hours, when the cheese is taken out free from skippers.

Claim.—1. The within-described process for extracting skippers from cheese by placing the cheese on a grating or other suitable support in a vessel and excluding the air from the same for a certain length of time, substantially as herein set forth.

2. The within-described apparatus, consisting of the box A, grating or rests B, outside rim C with vent *c*, and the cap D with vent *d*, and screw-cap G, and used with water or other suitable substance for excluding the air from the box, substantially in the manner and for the purposes herein set forth.

135,543.—*Cloth-Steaming Machine.*—HENRY S. GREEN, Sherbrooke, Canada, assignor of one-half his right to C. H. WESTON, Lowell, Mass.

Steam issuing from perforated pipes within a box impinges against the face side of the cloth and softens it, and a cold blast of air blown against the back of the cloth condenses the steam and prevents it from affecting the back.

Claim.—The combination, in a cloth-steaming apparatus, of one or more steam-pipes, constructed and arranged to convey steam to one side of the cloth, with mechanism constructed and arranged to convey a blast of cold air to the opposite side of the cloth, substantially as specified.

135,544.—*Coffee-Pot.*—BAYLESS GRIGSBY and THOMAS C. BRASKETON, Princeton, Ind.

Claim.—The combination, with a coffee-pot, of the bottomless box A with valve *a*, tube B closed and perforated at its upper part, cap D, spring *b*, and the box C with perforated top and bottom, all constructed and used substantially as set forth.

135,545.—*Railway-Ferry Track-Platform.*—WILLIAM P. HALLIDAY, Cairo, Ill.

A railway-ferry barge is provided with drop track-platforms for the transference of tracks to suit changes of gage during the river transit, thus saving the usual stoppage and delay for this purpose.

Claim.—1. A transfer boat or barge for railway cars provided with drop-tables, by means of which car-trucks may be lowered into or raised from the hold, substantially as and for the purpose specified.

2. A transfer boat or barge for railway cars provided with vertically-moving drop-tables and horizontally and laterally moving transfer-tables, substantially as and for the purpose shown.

3. A transfer boat or barge provided upon its deck and within its hold with railroad tracks having different widths of gage, and having suitable drop and transfer tables for moving car-trucks, substantially as and for the purpose set forth.

135,546.—*Excavating-Cart.*—WILLIAM HARLES, Washington, Mo.

The earth is carried up between the tire, casing, and flange, and is thrown into the cart through the spout by the gate, which is operated by the rod and stud on the wheel.

Claim.—1. The flanged casing E and spout G, in combination with the wheel B^1 having the broad tire B^2 and buckets *b*, substantially as specified.

2. A wagon or cart having the wheel B^1 with broad tire B^2, buckets *b*, and studs K, the flanged casing E, spout G, gate A, rod I, and spring *i*, substantially as specified.

135,547.—*Riding-Stirrup.*—ANDREW J. HERRING, Mauch Chunk, Pa.

The stirrup is made of wood with a spring attachment beneath the connection, the whole secured together by a bolt.

Claim.—1. A wooden stirrup constructed in one piece, with a block, B, upon each end, which blocks, when the stirrup is bent up, bear against each other, and are held together by a transverse bolt, substantially as described, for the purpose specified.

2. The stirrup-strap connected to the stirrup by means of the spring-frame H, substantially as described, for the purpose specified.

3. The spring frame consisting essentially of the metal loop I, block J, and the springs K, supported between the loop and the under side of the blocks B, substantially as described, for the purpose specified.

4. In combination with the spring-frame, the shield L, substantially as described, for the purpose specified.

5. The spring-frame arranged as described, to hold the loop of the stirrup-strap beneath the top and between the sides of the stirrup, substantially as described, for the purpose specified.

135,548.—*Moccasin.*—THOMAS HERSEY, Bangor, Me.

The moccasin has a flap secured to the outside of the tongue or vamp, forming pockets which exclude dust when the moccasin is secured to the foot.

Claim.—In a moccasin or shoe the pockets *g g*, formed, as described, by the combination of a front lap, *d*, and ordinary tongue *b*, united by stitches *f*, substantially as set forth and shown.

135,549.—*Ticket-Punch.*—HENRY W. HEWAT, Cincinnati, Ohio, assignor to HARVEY MILLER, same place.

The upper die is operated by two levers which unite to depress the die. The die is retracted after its cutting action by a spring.

Claim.—1. The vibrating or movable lever D of a card-punching instrument, when provided with a projecting shield, *d*, extending beyond the frame A, as and for the purpose specified.

2. The conical-sided die B secured in the frame A by the swaged indentations *a'''*, substantially as specified.

3. The grooved male die or punch C *c*, in combination with the swaged indentations *a'*, as and for the purpose specified.

4. The combination, in a card-punching machine, of a reciprocating punch or male die C, intermediate lever E, and handle-lever D, operating substantially as and for the purpose described.

5. In a card-punching machine, the reciprocating punch or male die, C, intermediate lever E, and handle D, in combination with the bent spring H, constructed and operating substantially as and for the purpose specified.

135,550.—*Sad-Iron Crimper.*—JOHN HEWITT, New York, N. Y.

A sad and crimping iron, with a detachable corrugated shoe connected by pivots. The shoe is constructed square or nearly so, and the corrugation extends the entire length of its lower surface.

Claim.—The corrugated shoe-plate B, having suitable bearings to connect it with a handle-block, A, or equivalent device, when said plate is of such form as to permit of its corrugations *b' b'* covering the entire surface of the plate and of their being of uniform length, so as to permit of the fluting being ironed with the flat surface of the plate, substantially as described.

135,551.—*Lifting-Jack.*—JACOB H. HINTON, Wayne county, Ohio.

The lifting-rod is operated by means of a friction-plate. A swinging lever disengages the dog from contact with the rod.

Claim.—1. The dog *a* held in position by lifting-rod and slotted standard, substantially as set forth.

2. The pivoted lever *c f* or holding the dog from contact with the rod, substantially as shown.

3. The dog *a*, held as described, the lifting-plate A, rod *g*, and lever *c*, when arranged to operate as specified.

4. The standard *a*, lever *c*, slot *d*, dog *a*, rod *g*, lifting-plate A, and lever *i*, when all are combined to form a lifting-jack, substantially as shown and described.

135,552.—*Car-Coupling.*—JOHN E. HITT, Bement, Ill.

The coupling-pin is held vertically within a tube upon top of the draw-head by means of a sliding bar, which projects beyond the face of the draw-head, and is actuated by a spring inclosed within a case, into which the sliding bar enters. The coupling-link is formed like a shuttle, and has a bar through its center to prevent it being longitudinally displaced when the cars are about to be coupled.

Claim.—The shuttle-link C, having solid rounded ends *a* and a cross-bar, *b*, extending beyond the sides thereof, as shown, in combination with the concave draw-heads B, the coupling-pins G, and supporting-rods *f*, the whole arranged and operating as described.

135,553.—*Nut-Lock.*—HARRISON P. HOOD, Indianapolis, Ind., and WILLIAM COOMBS, Bangor, Me.

Claim.—The combination of the washer-plate *d* provided with a lip, *c*, in connection with a button, *a*, turned up at the inner end *b* to engage a nut, *k*, substantially as and for the purpose hereinbefore set forth.

135,554.—*Coal-Scuttle.*—GARDNER HOWLAND, Brunswick, N. Y.

Claim.—A pail or scuttle formed with lip E, hinged flap or lid F, and lifting and tipping handles H and C, the whole being formed and arranged substantially as and for the purpose described.

135,555.—*Propeller for Vessels.*—ERWIN C. HUBBARD, Green Bay, Wis.

A conical hub, attached longitudinally to and around a shaft, has curved serrated seats upon its periphery, upon which seats are fastened blades overlapping each other around the shaft and tapering outward and to the rear, forming a conical-shaped propeller-wheel. Apertures or openings between the blades allow the entrance of the water, which is expelled from the rear opening of the cone. Braces and set-screws between the blades regulate the extension or contraction of the blades.

Claim.—A propeller or wheel having the shaft F, with or without the sleeve, the hub E with serrated seats *f*, tapering blades A forming the openings *a*, and the stays or supports B, constructed as described, and for the purposes set forth.

135,556.—*Ice-Crusher.*—FRANK HUDNER and JAMES R. LITTLE, New York, N. Y.

A machine having a fixed jaw and a jaw moving in the arc of a circle, said jaws being armed with steel conical teeth.

Claim.—1. The combination, with the jaws, of removable lock-plates for convenience in removing and tightening the teeth, substantially as described.

2. The stationary jaw, hinged at its upper end, and adjustable at the bottom by means of set-screws, as described, in combination with a movable jaw, operated as set forth.

3. The movable jaw, provided with means for clearing the throat of obstructions, substantially as described.

4. The combination, in an ice-crusher, of the eccentric, pitman-rod, and means for operating them, with the pivoted jaw moving, as described, and the adjustable stationary jaw, all constructed and operating substantially as set forth.

135,557.—*Combined Seat and Desk for Railroad Cars.*—WILLIAM C. HUFFMAN, Toledo, Ohio.

A seat connected or attached to a hollow upright or sleeve, with a shield or guard resting upon a pedestal passing into the sleeve and supported by a platform or foot, from which, and passing within the guard, is a coiled spring attached to the foot, and its vertical and rotary motion controlled by upright tapes or cords attached to the foot and the inside of the shield. To the sleeve, at a convenient distance from the top, attached by a bracket, is a writing-desk.

Claim.—1. A combined seat and desk, supported upon or by means of springs, and capable of vertical and rotary motion within certain limits, substantially as and for the purpose hereinbefore specified.

2. The device, as a whole, consisting of the base A, standard B, sleeve C, seat D, housing E, spring F, checks G, foot-rest H, and desk I and K, when said parts are constructed and combined substantially as and for the purpose shown.

135,558.—*Potato-Digger.*—JAMES WYGANT INNIS, Newburg, N. Y.

A potato-digger constructed with the ordinary mold-board, with arms extending rearwardly and secured to the rear part of the frame. To the under side of the mold-board are a number of independent flexible tines, which are secured by passing through holes formed in a V-shaped piece secured beneath the mold-board. The tines are each passed through separate links attached to a cross-chain.

Claim.—1. The combination, with the shovel-plow A, of the separator or inverted rake D, composed of independently-flexible hinged tines, constructed and arranged for operation, substantially as specified.

2. The combination of the transversely-arranged chain *g* and its attached links h with the independently-flexible hinged tines *e* of the inverted rake D, essentially as described.

135,559.—*Winding and Setting Watches.*—CHARLES E. JACOT, Chaux De Fonds, Switzerland.

A cross arm or thumb-piece, covered by the outer back-case, is so connected by a suitable gear as to wind up the watch without further exposure; while an adjustable slide transfers the gear engagement from the barrel to the center-pinion, it is desired to set the hands.

Claim.—The wheel *i* connected with the arms *s* and provided with the slide *r* within the cap *c*, in combination with the gear-wheel *n* upon the arbor of the main-spring, and the pinion *o* upon the arbor of the hands, substantially as set forth.

135,560.—*Bolt.*—EDWARD M. JUDD, New Haven, Conn.

A spring foot-bolt is constructed in two parts sliding within an ornamental case. The upper part is a dog with rib and groove,

a spring to hold it in place, a foot-piece projecting upward above the case, and is notched to engage a rib or inward projection at the top of the case. The lower part is a skeleton shank carrying a bottom spring, which throws the bolt up, when the dog is liberated. Pressure on the foot-piece throws the dog forward, locking the bolt, and when the foot-piece is pushed back it is released from engagement with the rib at top of the case and the bolt automatically withdrawn.

Claim.—The dog *l*, with the groove *o* below the foot-piece *m*, in combination with the spring-bolt *f h*, case *a*, and spring *n*, substantially as and for the purposes set forth.

135,561.—*Cord-Tightener for Curtain-Fixtures.*—HUBERT L. JUDD, Brooklyn, N. Y.

The cord slide is cast in one piece, and combines the fixed sheave, the stock, and the projections. The wedge-block is also cast in one piece, and is provided with the projecting tooth and the flanges to hold the wedge-block in the rack-case.

Claim.—1. The fixed sheave *c*, stock *i*, and projections *s*, cast in one piece, in combination with the rack *a*, substantially as and for the purposes set forth.

2. The wedge-block *l* with its tooth *r* and flanges *v*, in combination with the sheave *c*, stock *i*, and projections *s*, as and for the purposes set forth.

135,562.—*Curtain-Fixture.*—SAMUEL KER, Washington, D. C.

The bracket has either a spike or screw formed shank so as to drive or screw into the casing, and is combined with a tripod or *spider* shaped brace having a collar to surround the bracket and feet which rest against or penetrate the casing or window-frame.

Claim.—The combination of the roller-brackets E F and braces G H, substantially as and for the purpose set forth.

135,563.—*Lawn-Mower.*—SIDNEY D. KING, Middletown, N. Y.

A reel for blowing away the cut grass from the cutters is driven by the same shaft which drives the cutters.

Claim.—The combination of the shaft F, eccentric H, standard I, bar *b'*, pivoted cutters b, gearing G G', and reel L, substantially as specified.

135,564.—*Car-Starter.*—WILLIAM W. LAMBERTON and DANIEL R. LEHMAN, New Orleans, La.

The power being applied the draw-bar is drawn partially out and thereby gives the motor a certain momentum to aid in starting the vehicle. By means of an expanding-drum, actuated by a rack on the draw-bar and a cam secured to the rear axle, the power exerted in starting is partially economized, and as the car moves the draw-bar continually recedes until the power of the starter is expended, when it resumes its normal position.

Claim.—1. The combination of the expanding-drum C, wheel F, rack-bar, G, and spring Y, substantially as specified.

2. The rack-bar G, expanding-drum C, wheel F, rope or chain L, and case A, substantially as set forth.

135,565.—*Coal-Car Elevator.*—PHILIP H. LAMEY, Wiconisco, Pa.

An armed stop-lever, having a hand-lever attached, is pressed upon when the car is ready to start, depressing the stop upon the track, and permitting the car to pass; also a presser whose arms abut against the bumpers and propel the car, the rear ends of the arms being pivoted to a truck, which travels on a track below the car-track, and to one end of said truck is attached a weighted cord for giving a proper counter-balance to the weight of the car.

Claim.—1. The pivoted stop E connected with a hand-lever, F, and bell mechanism, as described, so that the same movement of lever will depress the stop and notify the engineer that the car is ready to start.

2. The pusher G, arranged, as described, in rear of car and operated by any suitable mechanism against the bumpers of cars to carry them to end of landing and beginning of slope.

3. The means described for operating the pusher G, consisting of the wheeled truck arranged in a pit and moved on its own track by a weight or other suitable mechanism, as set forth.

4. The pusher G, pivoted and arranged to rise at an upward inclination against the truck to enable the heavy spread-chains to be slided upon the arms *g g*, as set forth.

5. The construction of the track with longitudinal recess *d* through middle, as described, to allow vertical and longitudinal play to the rope, according to the position of the car and to its own position on drum.

6. The pivoted and curved and bifurcated catch L, arranged, as described, over the channel *d* for the purpose of enabling the truck to be drawn back with the car.

7. A rising track, *m*, connecting the upper and lower pusher-tracks in order to enable pusher to take up its position behind car, as set forth.

8. The rising pivoted track *m* combined with upper and lower tracks N N, as described, so that the pusher may pass over or under the top track without let or hindrance.

9. The friction-disks P P, one on each side of pulley O, and the friction-slides Q Q on bottom of car, combined as described, to retain pulley O in advance of the rope, so as to avoid friction thereon.

135,566.—*Bee-Hive.*—WILLIAM LEHMAN, Lexington, Mo.

The comb-frames are pendent from the top of an interior frame with bee-head floor, and this interior frame may be drawn out without violence to the combs or separation of any of the parts. Entrances for moths are arranged right and left of the bee-entrance, and attached to the inner side of the wall are passages to decoy them to the trap below.

Claim.—1. The interior sliding rack, consisting of the inclined bottom D, back E, and posts *a a*, with cross-bar *b* for supporting the comb-frames G G, substantially as and for the purposes herein set forth.

2. In combination with the entrances A A and passages *h' h'* into the moth-drawer, the boxes *k k* attached to the inside of the door H, substantially as and for the purposes herein set forth.

135,567.—*Bird-Cage.*—OTTO LINDEMANN, New York, N. Y.

Claim.—The swivel-buttons *d* arranged upon the flat surface of the platform *a* for confining the bottom ring *c* of a bird-cage in the recess *b*, substantially as herein shown and described.

135,568.—*Hydrocarbon-Gas Apparatus.*—LOUIS MARINO and EMILE MERTZ, Basle, Switzerland.

The oil is admitted through a central pipe below the valves, falls upon a perforated plate attached to the valve-stems, and is sprayed upon the heated bottom of the retort and the projections thereof. The gas accumulates in the lower part of the retort until its pressure exceeds that of the water in the washer.

Claim.—1. The valve-frame *k s* provided with the finely-perforated bottom plate *g*, the whole hung within the retort and operating substantially as and for the purpose described.

2. In combination with the perforated plate *g*, the edges *e e* projecting upward from the bottom of the retort, substantially as and for the purpose described.

3. In combination with the retort and its valves *k k*, the inlet-pipe opening into the retort below the valves, and connecting with the open reservoir C, substantially as and for the purpose described.

4. The combination of the retort suspended by its rim *b*, with the box in which it is suspended, and the removable cover *n* substantially as and for the purpose described.

5. The combination of the open reservoir and its inlet-pipe, furnace, retort, and valve-frame, outlet-pipe, and water-basin, substantially as and for the purpose described.

135,569.—*Wash-Boiler Attachment.*—MATHIAS MARTIN, Baltimore, Md.

A wash-boiler attachment constructed with a flange projecting downward from the platform parallel with the side of the boiler, the end of which for a given space is perforated. Covering the perforations upon the inside are guards or conductors intended to give direction to the water and steam, to the pipe attached to the opposite end of the platform, and through it to be conducted to the clothing to be cleansed.

Claim.—The box A, having perforations *a*, and combined with the diaphragm B and tube A', substantially in the manner and for the purpose described.

135,570.—*Hub for Vehicles.*—SAMUEL MCGEE, Madison, assignor of one-fourth his right to JAMES S. ADAMS and FRANCIS H. FAIRCHILD, Morristown, N. J.

The axle is secured within the hub by means of a collar which is attached to the axle, and revolves between the inner faces of the end caps. An oil-chamber is provided within the hub by leaving a space between the periphery of the collar and the central division of the hub.

Claim.—1. An oil-box or reservoir combining in its construction a central section, A, threaded-end sections B and C, a nearly central oil-chamber, and a packing-box or collar, B', the parts being constructed and arranged substantially as and for the purpose set forth.

2. The combination of the cylinder A, caps B and C, and collared shaft F, the parts being arranged for regulating the end traverse of the axles, substantially as and for the purpose set forth.

135,571.—*Middlings-Purifier.*—CHARLES E. MCNEAL, Silver Creek, N. Y.

Currents of air are created for separating the bran and dust from the middlings by a force and suction fan acting in conjunction with each other within an angular air-chamber having double air-inlets or discharge-openings, separated from each other by a prismatic partition.

Claim.—1. The combination, with the air-chamber H, of the force-fan B arranged at one end thereof to throw the middlings into said chamber, and of the suction-fan F arranged at the opposite end of the chamber, substantially as specified.

2. The triangular air-chamber H having its apex downward and open for the admission of air, and having the fans B F at opposite ends of its base, which is turned upward, substantially as specified.

3. The combination, with the fans B F and air-chamber H having double air-inlets I I at its lower end, of the air-leg D leading from the top of said chamber near the fan B into the top of the fan F.

4. The chamber H having the double air-openings I I separated by the prismatic partition J having its horizontal side downward, substantially as specified.

135,572.—*Cigar-Mold.*—FREDERICK C. MILLER, Cincinnati, Ohio, assignor to himself and HENRY C. PETERS.

In the bottom of the lower die is a heart-shaped section, from which the other parts are lifted to receive the full complement of tobacco, and in their descent a perfect cigar-bunch is formed.

Claim.—The plates or boards D and E, provided with a series of cigar-molds, each of which is composed of the parts A, B, and C, in combination with the base F having jaws *f f*, substantially as and for the purpose specified.

135,573.—*Cot-Bed.*—LEANDER B. MORSE, Athol, Mass., assignor of one-half his right to LABAN MORSE, same place.

The cross-bars are attached to the longitudinal girders and to the girders folding legs. In the upper side of the cross-bars are pins. The slats are slotted to receive the pins, and a slat holds

them in place at the foot. A head-board is hinged to the top, and also acts as a cleat upon the slats at that end.

Claim.—1. A bed-frame consisting of the cross-bars A and A' and the girders or side pieces B B, provided with the legs D, and secured to said cross-bars in such a manner that, while they serve as stretchers to keep said bars the proper distance apart they may be rotated for the purpose of folding the legs under the bed when not in use, substantially as described.

2. The combination of the slats C C provided with the slots *d d*, the cross-bar A having inserted in its upper side the pins *b b* to fit into said slots, and the holding-down cleat F, all constructed and arranged substantially as described.

3. In combination with the slats C C provided with slots *d d*, and the cross-bar A having inserted therein the pins *b b*, I claim the head-board G, hinged to the cross-bar *A* in such a manner that it may be placed in a perpendicular position or folded down onto the slats and serve the purpose of holding the slats in position on the pins while they are free to move endwise thereon, substantially as described.

135,574.—*Lightning-Rod.*—WILLIAM B. MUNN, Cleveland, Ohio.

The rod consists of two or more wire cores, enveloped closely with sheet-copper, whose meeting edges are tucked inward between the two adjacent wires.

Claim.—A lightning-rod composed of a central wire cable core, or its equivalent, surrounded by a sheet-metal conducting covering, when the edges of such covering are tucked away, substantially in the manner and for the purposes herein set forth.

135,575.—*Sawing-Machine.*—WILLIAM NEIDENTER, Mitchell, Ind.

Claim.—1. The combination of the spring L, spur-wheel J, pawl and ratchet *e* N, gearing E *f f' f'' f'''*, shaft L', and saw D, substantially as specified.

2. The adjustable shaft *s* provided with the friction-roller E' and the lever or dog G, in combination with the saw-shaft D' having the friction-roller F, the rack *g*, and the spring L, substantially as specified.

135,576.—*Ice-Machine.*—HENRY NORMAN and CHARLES F. DIETRICH, New Orleans, La.

The air from the condensing apparatus passes through a drying cylinder containing chloride of calcium into a cooler constructed of coiled pipe immersed in water, and on to the refrigerating-chamber through the air-regulating apparatus.

Claim.—1. The drier, Fig. 3, consisting of the outer cylinder A^3 and interior cylinders A^4 and B^4, and which latter have their bottoms perforated, as stated, tube E^1, and cap F^1, the whole being so combined and arranged as to compel the air introduced into the outer cylinder to expand through the drying material contained in the inner cylinder B^4, substantially as described.

2. The air-regulator, Fig. 7, consisting of the chamber A^5, perforated tube P, valve P^1, piston-rod c^1, piston d^1, and cup D^4, the whole being so combined and arranged as to operate substantially as described.

3. A refrigerating apparatus consisting of the pump, air-compressing engine, cooler, reservoir, and distributer, when the same are constructed as described, and so combined and arranged as to operate substantially as specified.

135,577.—*Device for Pressing Hats.*—CHARLES M. OSGOOD, Amherst, Mass.

The hat-body is pressed into the metallic die by the rubber core expanded by wedge and cam.

Claim.—An auxiliary male pressing die, of India rubber or other suitable material, combined with the dies of a hat-press, and expanded by a wedge advanced by a cam or other equivalent mechanism, substantially in the manner and for the purpose herein set forth.

135,578.—*Treating Tin Scrap and Obtaining Useful Products.*—HENRY PANTON, New York, N. Y.

The tin scrap is placed in a revolving inclined box provided with hollow journals, through which is passed dry chlorine gas so as to form and carry over to a condenser bichloride of tin, which is precipitated as oxide and reduced. The iron is formed into hollow ingots and melted to form steel or worked into bars.

Claim.—1. A treating-chamber which, by being made to revolve, will agitate and turn the tin-plate scraps within it over, so as to expose all parts of their surface to the action of chlorine gas.

2. The rectangular-shaped chamber or receptacle, supported, at an inclination of a few degrees, by hollow journals turning between friction-rollers, on a frame, and having at the upper end a man-hole, and on one of the sides, near the lower end, a second man-hole—the first through which to charge the chamber, the second to discharge its contents—all arranged and constructed substantially as described.

3. The compact hollow ingot of treated tin-plate scraps, of about the proportions described, and for the insertion of the powdered charcoal, pyrolusite, and other ingredients used in the manufacture of cast-steel, substantially as described.

4. The combination of a revolving treating-chamber with a chlorine generator and a condenser, as and for the purpose set forth.

5. The mold herein described for forming hollow ingots of scrap-iron, composed of the sides *i i*, perforated anvil *j*, piston *l*, and hammer *q*, combined and arranged to operate as set forth.

135,579.—*Feeding Mechanism for Sewing-Machines.*—CHARLES PARHAM, Philadelphia, Pa.

The frame A is secured by the bolt to a slotted hanger projecting from the under side of the cloth plate. In this frame is a shaft having a boss that fits the end of the bolt and serves as the axis of the feed-wheel, which is made and operated by clutches, as usual, except that the foot of the actuating arm of the clutch is hinged to remain at all times in the same position with reference to its actuating cam, notwithstanding the lateral movement of the wheel and shaft. The shaft carries a ratchet-wheel with a cam-grooved hub, into which projects a pin fixed to the frame, and as the ratchet and cam are turned the shaft and wheel are moved laterally according to any desired pattern.

Claim.—1. In combination with the clutch-arm *g*, the foot *i*, hinged to the clutch, and provided with pin *j*, adapted to a recess in the frame, so as to allow the feed-wheel to move laterally without so moving the foot *i*, as and for the purpose described and represented.

2. In combination with the frame A, the b lt K, when serving not only to unite the frame and its varied parts to the bed of the machine, but when also serving as a support for the hub-boss M that carries the feed-wheel K, as described and represented.

3. The combination of the cam I, its yoke J, and pawl *q*, operated by the shaft C, with the ratchet *d*, cam O, and shaft M, for the purpose of giving a lateral motion to the feed-wheel, substantially as described.

4. The combination, with the ratchet and pawl, of the shield *p* for covering said ratchet, and so preventing the pawl from reaching it, and thus throwing the laterally-moving parts out of action, as and for the purpose described.

5. In combination with the frame A for sustaining and carrying most of the feed mechanism, the projections *b* and set-screws *a*, for adjusting said mechanism, so as to work true with parts otherwise sustained on the sewing-machine, as described.

6. The frame A, constructed as herein described and represented, and for the purpose set forth.

135,580.—*Bed-Bottom.*—CHESTER PENFIELD, New Britain, Conn.

Upon a rectangular frame are cars with slots and holes. To these cars are hung head and foot bars. Within the bars compressing springs are inserted that hook into the eyes of the links. Each link has three eyes, into which hooks are inserted to join the fabric together.

Claim.—1. The combination of the cars D D, the pins *d d*, the heads C C, the springs *m*, and the hooks *n*, substantially as described, and for the purpose set forth.

2. The solid link *b*, with its triplet of eyes *a a a* formed upon the end, substantially as and for the purpose described.

135,581.—*Reed-Organ Reed.*—JOSEPH R. PERRY, Wilkesbarre, Pa.

The reed frame or block is cut through for only about one-half the vibrating length of the reed to confine the current to the free end thereof.

Claim.—The block B formed with a partial opening less in length than the vibrating portion of the reed-tongue, substantially as described and shown, and combined with the tongue A, as and for the purpose specified.

135,582.—*Compound for Hydraulic Cement.*—ANTHONY PFUND, New York, N. Y.

The term "Pfundite" is applied to a mineral exhibiting the following analysis:

Silica	61 30
Alumina	21.85
Oxide of iron	14.10
Lime	1 30
Magnesia	1 3
Hygrometer moisture, and loss	.82
	100.00

Claim.—1. A compound produced by subjecting Pfundite to a red heat, substantially as described, whether alone or previously or subsequently combined with other materials, as set forth.

2. A compound produced by burning Pfundite, then mixing it with hydraulic lime or cement, and with sawdust, peat, charcoal, or other bad conductor of heat, substantially as set forth.

135,583.—*Packing-Case.*—EDWARD A. PEABO, Philadelphia, Pa.

A packing case or bucket of ordinary construction, with an annular groove, into which is fitted, within the top or near the top of the bucket, a metallic ring with projecting hooks, into which is fitted one of less size, to which the cover is attached. The inner or upper ring is constructed with notches, through which the hooks of the lower ring are passed, and by a slight rotary motion or turn the hooks are brought in contact with an incline face upon the upper ring and the cover securely fastened.

Claim.—1. The ring B fitting in the chine-slot and provided with the grooved ears b^2, as set forth.

2. The combination of the rings B and D, constructed as described, with the vessel A and head C, as set forth.

135,584.—*Machine for Dressing Cam-Grooves.*—GEORGE M. PRATT and VICTOR A. KING, Middletown, Conn., assignors to THE VICTOR SEWING-MACHINE COMPANY, same place.

The blank to be finished has previously a cam-groove formed around it, either by casting, milling, or otherwise; it is then clamped in this machine upon a mandrel, which rotates it. A milling-tool, situated upon a pivoted holder, is made to follow the groove as it turns, which vibrates the said holder. The tool is automatically oscillated, as it mills the edges of the cam-groove, by means of an arm that connects the tool with the frame, the vibrations of the holder effecting this movement.

Claim.—1. In combination with the mandrel A, to hold and revolve the blank D, the vibrating tool-holder G, the center of vibration being distant from the axial line of the cam equal, or near-

ly so, to the length of the arm to be revolved by the cam, substantially as described.

2. The tool *d* for milling the groove of the cam, having the teeth cut in A-form and running spirally around the tool, substantially as set forth.

135,585.—*Clothes-Wringer.*—GEORGE S. PRINDLE, Washington, D. C., assignor to THE QUEEN CITY WRINGER COMPANY, Cincinnati, Ohio.

A crank is attached to the shaft formed with a shoulder and secured by an ordinary screw. From the crank a second shoulder is formed, to which is fitted a screw with a thread of less pitch than the other, to securely hold the crank in position by a jam-nut. On the opposite end of the shaft is a gear with projecting sides or edges into which the upper gear meshes to secure it against side motion. On the lower end of the frame or sides thumb-screws are passed through the oblong openings and held by a nut within it, by a button to which an elastic pad is attached to secure it to the tub and prevent abrasion.

Claim.—1. In combination with the roller-shafts of a wringing-machine, a plain gear-wheel and a double-flanged gear-wheel, combined and working together substantially as and for the purpose specified.

2. In combination with a roller-shaft and with a crank screwed upon the end of the same, a jam or locking nut placed upon said shaft outside of said crank when the screw-thread within said nut and upon which it traverses has a less or finer pitch than the screw-thread upon which said crank is placed, substantially as and for the purpose shown.

3. In combination with the pivoted button M and clamping-screw L, connected with and operating through the leg A', as shown, the pad N, constructed of or from elastic material and secured to or within said button, substantially as and for the purpose set forth.

135,586.—*Cotton-Cleaner.*—JOE RALSTON, Brenham, Tex., assignor of part interest to DARIUS S. SKINNER, NATHAN B. HALL, and EDWARD J. BICKNALL, Providence, R. I.

A breaker and a cleaner are arranged for simultaneous operation by one motor, the breaker carrying the cotton upon an endless apron to pass between a peculiarly-spurred roller and a toothed bar, to be delivered over the roller to another apron, which feeds the cleaner in like manner.

Claim.—1. The endless apron of cleaner B, in combination with the saws G, clearers H, roller N, ribs M, substantially as described.

2. The endless apron of cleaner B, in combination with the saws G, stripper I, conductor L, and ribs M, substantially as described.

3. The endless apron of cleaner B, in combination with the saws G, clearers H, ribs M, roller N, stripper I conductors L, blowers O and P, and trunk K, all as herein described, and for the purpose described.

135,587.—*Lining for Fire-Places.*—ALBERT J. REDWAY, Cincinnati, Ohio, assignor to REDWAY AND BURTON, same place.

Claim.—The refractory blocks recessed at *a a' a''*, in combination with the metallic frame *B b d d'* and detachable clamping-bar *C c c'*, substantially as specified.

135,588.—*Flour-Bolt.*—FREDERICK RENDER, Beech House, Etchells, England.

Pipe conveying blast connected to reel by crank, so as always to be at same distance from reel.

Claim.—The pipe B and chamber C, in combination with a reel, A, and with oscillating and adjusting devices, substantially as set forth.

135,589.—*Stuffing-Box for Pi ton-Rods, &c.*—PHILLIP W. RICHARDS, Boston Highlands, Mass.

Sectional rings of peculiar form are adjusted by set-screws and springs arranged in an encircling ring.

Claim.—A ring for stuffing-boxes formed in sections *f g h m*, adjusted by set-screws *b*, as herein shown, and arranged to operate in connection with an outside ring, substantially as and for the purpose specified.

135,590.—*Spoon, Fork, &c.*—GEORGE C. ROBINSON, Cincinnati, Ohio.

An ordinary spoon or fork constructed with projecting ribs upon the handle, bowl, or tines of the fork, that the wear by friction shall be limited or confined to the rib and the plain or polished surface be protected.

Claim.—In the construction of spoons, forks, or other article of similar character, I claim the visible definitely-formed ribs or projections *a*, of any suitable material, raised above the ordinary bearing-surfaces of the spoon or fork, and attached thereto by soldering, riveting, or other suitable manner, or by forcing them up from the body of metal of which the article is composed, for the purpose of receiving and definitely limiting the extent of the wear upon the bearing-surfaces of such articles, substantially as set forth.

135,591.—*Boot and Shoe.*—HOMER ROGERS, Sudbury, and LEWIS FELTON, Marlborough, assignors to themselves and STEPHEN MOORE, Sudbury, Mass.

The boot or shoe is made of leather and leather board. That part of the shoe most exposed to dampness and subject to extraordinary strain from stitching or nailing is made of leather, and the remainder of paper. The two materials are united edge to edge.

Claim.—1. A boot or shoe vamp or quarter made of leather and leather board, the leather being that part which is to be united to the sole and the leather-board portion being the remainder of the vamp or quarter.

2. A boot or shoe having its upper made partly of ordinary leather, as described, and partly of leather board, the leather board and leather being united edge to edge.

135,592.—*Combined Torch and Fire Lighter.*—PHILIP RYAN, Albany, N. Y.

A torch is attached to the end of an arm secured to a plunger, and so arranged as to be operated by the foot for purpose of lighting the fire of a steam fire-engine while under way.

Claim.—The combination of the plunger E, spring C, and arm F with the torch I, when arranged to operate as and for the purpose herein specified.

135,593.—*Carriage-Painter's Jack.*—ALVARO G. RYKERT, Attica, N. Y.

A standard is provided with a semicircular catch-wheel or sector, in the top of which is pivoted a movable cross-armed platform, to which the carriage-body may be attached.

Claim.—1 The cross-bars *f f'*, provided with the slots *j j* and grooves *m m*, in combination with the keys *k k* and wedges *n*, said bars being swiveled upon a sector-wheel by the shaft and plate *d*, substantially as and for the purpose specified.

2. The sector-wheel B provided with the socket *c*, for the shaft and plate *d* of the platform, in combination with the spring-pivoted catch A, substantially as and for the purpose specified.

3. In combination with the sector-wheel B and pivoted cross-bars *f f'* the locking-pin *i*, substantially as described.

135,594.—*Wheel-Plow.*—MARSHALL SATTLEY, Taylorville, Ill.

By the action of the lever provided with two arms, the point of the tongue is depressed and the plow is raised by the same operation.

Claim.—1. In combination with the frame of the machine and with the pivoted plow-beam, the tongue I pivoted in front of its rear end, the lever K provided with the arms *k* and *x*, and the connection L, substantially as and for the purpose shown.

2. The hereinbefore-described machine, consisting of the axle A, ground-wheels B, rails C and C', plow-beam E, clevis F, plow G, standards H and H', pole I, lever K and *k*, detent K', connection L, and quadrant M, when said parts are constructed and combined to operate substantially as and for the purpose specified.

135,595.—*Mustard-Pot.*—THEODORE M. SCHLEIER, Knoxville, Tenn.

The vessel has near its bottom a spout, which is closed by a gate, that is connected by a rod with a lever-arm arranged on the cover. A rod extends from the lever-arm through the center of the cover, and terminates in a piston furnished with a downward-opening valve. A spring under the lever-arm causes the gate to shut automatically and lowers the piston.

Claim.—The combination of the cup A, spout B, piston I, valve L, gate C, and operating devices E, E', H, and D, substantially as and for the objects stated.

135,596.—*Traveling-Bag.*—REINHARDT SCHMITT, Newark, N. J.

Claim.—1. The loops *d* made with flanges 2 that are secured by means of the cap A that is applied to and combined with the loop *d*, substantially as set forth.

2. The loop *d*, bolt 3, and cap A, in combination with the handle *e* and the hook 5, as and for the purposes set forth.

135,597.—*Paper-Feeding Machine.*—SOCRATES SCHOLFIELD, Providence, R. I., and CHARLES E. BAKER, Mont Clair, N. J.

The upper sheet of the pile of paper is separated by pads, it being penetrated by pointed fingers which prevent the other sheets from moving, over which it passes and from which it is torn upon its seizure by the gripers of the printing-press.

Claim.—1. An inclined holding-pin, D, arranged to press upon the top of a pile of paper, and upon the inclined point of which the top sheet is drawn by means of friction-pads or otherwise.

2. The combination of the inclined pins D D, cross-bar B, pad E, and slide G, operating to first draw the sheet upon the pins, and then to raise the edge of the sheet, substantially as described.

135,598.—*Paper-Feeding Machine.*—SOCRATES SCHOLFIELD, Providence, R. I., and CHARLES E. BAKER, Mont Clair, N. J.

Upon the backward movement of carriage, pads pivoted thereon carry the upper sheet of paper, from pile on pivoted and self-adjusting table, over pointed bars, which are alternately held to permit such movement by pivoted griping-bars operated by suitable levers, and is then carried against spring-guides, which, through reaction, register it, a spring-guide with surface to lift the edge forming a side register. A stop-motion, consisting of an armature and a pointed lever, upon the feeding of more than one sheet, or none being fed through lever vibrating in the path of their end oscillations, shifts the driving belt.

Claim.—1. The combination of the pressure-finger *a*, bearing-roller *b* or an equivalent, and gripers *c* and *d*, operating substantially as described.

2. The combination of the friction-pads P P, carriage L, spurs X X, and registering-springs Y Y, operating to first draw the sheet beyond the proper point of register to be returned thereto by the reaction of the springs, substantially as described.

3. The registering-guide Z, arranged with an inclined or lifting face for first raising the edge of the sheet and then forcing it to the proper point, substantially as described.

4. The combination, with the operative mechanism of a self-feeding printing-press, of either the lifting device *l'* or holding device *y* with the indicating-lever *t*, vibrating lever *r*, and shipper *p* or its equivalent, operating substantially as described.

5. The spur *s*, used for the purpose of indicating the distinction between one and two sheets by their varying resistance to puncture.

6. The roaking-fly *a'* operating to strike fair upon the top of the increasing pile of paper, substantially as described.

135,599.—*Paper-Feeding Machine.*—SOCRATES SCHOLFIELD, Providence, R. I., and CHARLES E. BAKER, Mont Clair, N. J.

The blunt-edged holding instrument is pressed firmly upon the upper sheet of the bank of paper, and tears a chip from the upper sheet when it is moved, the instrument holding the sheets beneath from being moved.

Claim.—A holding instrument with a non-penetrating point or edge, when applied under proper pressure to the top sheet of a pile of paper, and constructed, as described, so that, by reason of its desired failure to cut or penetrate the said sheet, it will tear a slight chip therefrom whenever the sheet first commences its proper movement under the action of friction-pads or otherwise.

135,600.—*Folding Door-Key.*—JOSEPH SEIBERT, Pittsburg, Pa., assignor to THE JONES AND NEBUCK MANUFACTURING COMPANY, same place.

A circular groove, provided with a stop, is formed around the rivet in the inner face of one part of the key, and suitable projections or stops extending from the other part into the groove, which stops serve to limit the motion of the parts in opening and closing the key.

Claim.—The groove *c* in combination with suitably-arranged stops *d*, *f*, and *f'*, for limiting the motion of the parts *a* and *b*, substantially as described.

135,601.—*Harness-Tug Buckle.*—FRED. SEIVERT, Knoxville, Iowa.

Claim.—In a harness-tug buckle having inclined side openings and edges, the sliding buckle-plate D having the stud *d*, wedging-arms *e*, movable fulcrums *e'*, and thumb-piece *f*, all substantially as and for the purpose specified.

135,602.—*Grain-Scourer.*—THOMAS SHIVELEY, North Lansing, assignor of one-half his right to BENJAMIN E. HART, Lansing, Mich.

Two revolving spiral-toothed cylinders inclosed in cylindrical cases, connected by a tube, and having a fan-attachment for cleaning and scouring grain.

Claim.—In a grain-scouring machine, the combination, with the cylindrical cases C, the connecting-tube F, and the fan-attachment E, of the cylinders B having teeth arranged spirally but in opposite directions, and arranged to revolve in said cases, substantially as specified.

135,603.—*Pencil-Holder.*—GEORGE A. SMITH, Boston, Mass., assignor to W. H. W. CAMPBELL, Norwich, Conn.

A short tube, holding the pencil loosely, has its inner end slotted, whereby it is adapted to be clamped upon the pencil when inserted within a tubular handle.

Claim.—The combination of the tubular case and the clamping device, composed of a section of tube open at both ends and slotted at one, the retention of the pencil being effected by forcing the clamping device within the case, all as and for the purposes above shown and described.

135,604.—*Mortising-Machine.*—JOHN H. STAHL, Stanton's Mills, Pa.

A carriage for holding the material is so arranged as to have a vertical motion as well as a lateral and longitudinal movement upon a horizontal plane.

Claim.—1. The hinged vertically-adjustable clamp *g'*, screw, nut *I*, spring *J*, and moving table G, substantially as specified.

2. In a mortising-machine, the screw D, in combination with the adjustable frame C holding the longitudinally-moving table F and the laterally-moving table G, substantially as specified.

3. In a mortising-machine, the adjustable screw-rod L having its bearing in the standards M, in combination with the horizontal sliding table F, cord *f'*, weight *f*, and pulley *f''*, operating in the manner substantially as specified.

135,605.—*Ditching-Machine.*—REUBEN STARBRICK, Wilmington, Ohio.

The frame of the wheel is carried on a wagon-truck, and is raised and lowered by means of a rack and pinion. The ditching-wheel is suspended from the frame, between the standards, and the spades are caused to reciprocate through the slots in the rim of the wheel by means of the followers at their rear ends, which travel on the inside of the cam F and on the outside of the cam F'.

Claim.—The improved ditching-machine, having the rotary ditching-wheel D with slotted rim devoid of flanges, the semi-elliptical cams F F' of different sizes rigidly secured to the standard B', the reciprocating spades E having the followers *e*, the scraper-plow G', and semicircular dirt box or spout G, in combination with the frame A having the toothed racks I, cutters H', and scraper H, and the wagon J supporting the pinion-shaft L, all substantially as and for the purpose specified.

135,606.—*Ironing Apparatus.*—ELISHA SUMPTION, South Bend, Ind.

The top of the table is movable on rollers. Side pieces and standards are attached to the table, and between these a wheel is operated by treadles and cords. Cords are also attached to the wheel and a horizontal pitman, at one end of which is secured a smoothing-iron that operates on clothing on the table.

Claim.—The combination of the table A, the top movable on friction-rollers, with side pieces *h* and standards *i j*, the treadles *g*, cords *f*, wheel B, the pitman E, and the smoothing-iron C, as and for the purpose specified.

135,607.—*Fire-Kindling.*—WILLIAM B. TUCKER, Baltimore, Md., assignor to JOHN G. MCCULLOUGH, same place.

Claim.—Treating wood, spent tan-bark, or sawdust with heated resin-oil or heated paraffine-oil, substantially as described, for making fire-kindlings.

135,608.—*Metallic Fabric for Scouring Grain and Percolating Purposes.*—ANDREW J. VANDEGRIFT, Covington, Ky.

Slips of sheet metal, folded at their ends, secured in grooved posts and strengthened by external rings. Folds keep the slips apart, forming interstices between them.

Claim.—1. The combination of folded plates A and grooved posts B, substantially as described, and for the purpose specified.

2. The combination of folded plates A, grooved posts B, and rings C, connected substantially as and for the purpose specified.

135,609.—*Spool-Stand and Thread-Cutter.*—LEWIS F. WARD, Marathon, N. Y.

The thread-cutter is movable about the center of the stand.

Claim.—1. The thread-guide C provided with the elastic band D, in combination with a series of spool-holders, substantially as and for the purpose specified.

2. The combination of the spool-stand, substantially as herein described, with the cutting apparatus arranged to operate horizontally and to revolve on a vertical axis, as and for the purposes specified.

135,610.—*Machine for Marking Designs on Glass, &c.*—HENRY A. WASHELL, Stourbridge, England.

A convenient arrangement for holding the glass articles by a perpendicular rotating spindle, with an elastic arrangement for holding the etching-needles.

Claim.—1. A machine constructed substantially as hereinbefore described, and for the purposes set forth, in which the object in glass or other material to be operated upon preparatory to etching is placed and worked in a vertical position.

2. The radial or operating-arm D, with its universally-jointed bracket I and needle-holder, together with the spindles C, H, and J, and sliding stem *f'*, by which the said needle-holder may be fixed or adjusted and operated at any diameter or at any angle to suit objects of a spherical or other shape.

3. The needle-holder, as shown, with its adjustable needles operated by elastic bands to press and act equally upon any irregular or rounded surface.

4. The device, shown in Figs. 6 and 7, for producing wave motion.

5. The devices for producing reciprocating or continuous vertical movement, consisting of eccentric *e*, and drum and clutch *e'* *e''*, and draw-chain connection, which, in combination with the rotary and stop movements of the object to be etched, produce vertical and spiral patterns.

6. The devices for holding glass or other objects on the operating-disk *c* without clamps, consisting of the swivel-pad *k*, sliding stem K, and spring *k'*, with pulley and cord, as shown, for lifting the pad when changing the work.

135,611.—*Stove-Damper.*—JAMES D. WILLOUGHBY, Washington, D. C.

An expansible strip of metal in the oven, in its movements under heat or cold, operates, by means of a crank-shaft and eccentric, a damper in the stove-pipe. To the damper an index-finger is attached on the outside of the pipe.

Claim.—1. An automatic damper-controlling apparatus, combined with and located in the oven of a stove or range, and connected by suitable mechanical appliances to a damper, which, when moved by the action of the heat, will cause an increase or decrease of heat in the oven, as may be desired, substantially as and for the purpose set forth.

2. The sleeve 8, the disk or piece 12, and arm 9, connected to the damper, and arm 6 provided with an adjustable catch or nut, 7, as and for the purpose set forth.

3. The combination, with the thermostat for a stove-pipe, of the shaft 37, eccentric 31, and damper, substantially as described, and as shown in Figs. 5 and 6, and for the purpose set forth.

4. The combination, substantially as described and as illustrated in Fig. 5, of two or more thermostats, whereby their force and motion will be in the same direction, and they will have greater force and length of movement that can be obtained by a single thermostat made of thicker metal.

135,612.—*Depurator for the Teeth and Gums.*—JOHN DANIEL WINGATE, Carbondale, Pa.

The vacuum-cup is supplied with a nozzle and lip, which latter is lined with India-rubber. From the upper end of the vacuum-cup a rubber hose extends to the air-pump. The opening at the lip end conforms to the shape of the gums somewhat, and by means of the rubber readily conforms thereto.

Claim.—An apparatus for treating the gums, consisting of the cup A, nozzle B, and soft-rubber lip *a*, all arranged for connection with an exhaust apparatus, as described.

135,613.—*Drilling-Machine.*—EDWARD J. WORCESTER, Worcester, Mass.

Two parallel vertical shafts are fixed in a frame. One is the drill-shaft, with a feed-screw swiveled into its upper end. The nut which lowers the drill has a beveled wheel, and a crown ratchet-wheel attached to it, which is operated by a pawl actuated by a cam on the shaft G. The shaft G is connected to the drill-shaft by gear-wheels. A loose beveled gear-wheel on the shaft G is raised in contact with the beveled wheel on the feed-nut to reverse its motion and raise the drill rapidly.

Claim.—1. The drill-shaft G', having its lower section vertically adjustable, and connected to its upper section by means of the

feed-screw P, in combination with the crown ratchet-wheel L, dog L^1, pivoted arms L^2 M, cam I', and shaft G, substantially as specified.

2. In combination with the gear-wheel K, the stud K^2 sliding in a socket of the frame A, and pivoted to the lever K^3, by means of which the wheel K is raised and lowered, substantially as set forth.

3. The combination of the spring N, the pivoted arms L^2 M, dog L^1, and ratchet L, and shaft G, substantially as specified.

4. The combination of the stud Z and adjusting-screw O, with the arms M M^1, dog L^1, and ratchet L, substantially as and for the purpose specified.

5. The arm I depending from the dog L^1, in combination with the adjustable wheel K, wheel K^1, ratchet-wheel L, and drill-shaft G', substantially as specified.

6. In a drilling-machine, the shaft G, having an oval cam, I', with its lower surface recessed to form a clutch-box, substantially as and for the purpose set forth.

135,614.—*Railroad-Car Truck.*—WALTER YOUMANS, Lansingburg, N. Y.

Means for facilitating the turning of curves.

Claim.—1. A truck-frame the parts of which are pivoted together so that it may be distorted, (or the wheel-pieces may be moved to assume different angles with the end bars,) substantially as and for the purposes described.

2. The combination, with the truck-frame, axle, and jaws, of boxes adapted to turn within the jaws, substantially as and for the purposes described.

3. A center-beam pivoted or hinged at each end to the wheel-pieces, substantially as and for the purposes described.

4. In combination with the truck-frame and hinged center-beam, the straight grooved shoe-pieces F or their equivalents, substantially as and for the purposes described.

135,615.—*Mode of Treating Leather Remnants.*—BARKER C. YOUNG, Boston, Mass.

Claim.—The process of treating leather trimmings or remnants, consisting in subjecting them to a solution of soda and potash to extract the color, &c., and then immersing them in a solution of sumac, salt, and alum in water to color and soften the leather, substantially as set forth.

REISSUE PATENTS.

5,265.—*Wringing-Machine.*—HERMAN GLASS, Honeoye Falls, N. Y., assignor, by mesne assignments, to BAILEY WASHING AND WRINGING MACHINE COMPANY.—Patent No. 39,141, dated July 7, 1863.

A wringing-machine of the ordinary construction, with two elastic rollers, has a flexible curved clamp attached to the standards, for the purpose of clamping the machine to a round or square tub, and is adjusted by set-screws.

Claim.—1. In a clothes-wringer having rubber rollers, an adjustable, curved, flexible clamp for the purpose of attaching said wringer to a tub or other receptacle.

2. In a clothes-wringer having rubber rollers, an adjustable curved clamp, as described, operated by means of set-screws.

3. In a clothes-wringer having rubber rollers, a curved clamp, in combination with set-screws and supporting-standards, or their equivalent, substantially as described.

4. In a clothes-wringer having rubber rollers, a curved clamp and set-screws, in combination with elastic strips or equivalent means for drawing back the clamp when loosed from the tub or receptacle.

5. The standards A A, having central vertical openings or cuts in their lower ends, when portions of the sides of the opening in each standard are beveled so as to conform to the curvature of a circular tub, while other portions remain parallel with the length of the machine and render it adjustable also to a straight-sided receptacle, in combination with the clamp G, substantially as shown and described.

6. A device for clamping a clothes-wringer to a tub or other receptacle, consisting of a curved clamp, G, set-screws i, cross-piece b or equivalent support, guide-pins g, elastic strips h or their equivalents, and standards A, substantially as described.

5,266.—*Stuffing for Mattresses.*—FREDERICK A. LANE, Cleveland, Ohio, assignee, by mesne assignments, to himself, LUTHER S. LANE, and EPHRAIM KENDALL.—Patent No. 90,304, dated May 23, 1869.

The material used for stuffing is composed of the fibers of refuse woolen goods, rags, &c., which is bleached or curled to render it less liable to pack or mat together.

Claim.—The prepared homogeneous woolen fiber for stuffing, bedding, upholstering, &c., when made from the waste or refuse of woolen goods, rags, &c., and by separating the woven or interlocking fibers thereof, and rendering them free and open, substantially as set forth.

5,267.—*Printing-Telegraph.*—GEORGE LITTLE, Rutherford Park, N. J.—Patent No. 123,563, dated April 9, 1872.

The type-wheel is made the pole of an electro-magnet by having a coil surrounding its shaft, and thus attracts or repels a vibrating electro-magnet, for the purposes of making the desired impressions. The type-wheel is revolved by a radially-swinging friction-lever, which acts as an armature to a third electro-magnet.

Claim.—1. An iron type-wheel, polarized by induction, in combination with a magnet, to effect the impression when the polarity of the type-wheel is changed, substantially as set forth.

2. The type-wheel upon an arbor running through a coil, and provided with a swinging armature-clamp to move the type-wheel, in combination with an electro-magnet for said armature, substantially as set forth.

3. The electro-magnet m' n set to swing and carry the armature n' and impression-roller l', in combination with the type-wheel, as and for the purposes specified.

4. A magnetized type-wheel, in combination with the swinging electro-magnet, to effect the impression and feed of the paper when the polarity is reversed, substantially as specified.

5. Two or more magnetized type-wheels in one electric circuit, and revolved in unison by pulsations from the transmitting instrument, substantially as specified.

6. A radially-swinging armature upon the type-wheel shaft, in combination with a type-wheel and an electro-magnet, whereby said type-wheel is moved around progressively by the direct action of the armature upon the shaft, substantially as set forth.

5,268.—*Elevator.*—HENRY S. STEWART, Newark, N. J.—Patent No. 21,821, dated December 12, 1871.

Claim.—1. The buckets G G, secured between the endless parallel chains F F, and supported by end flanges m m upon the links f^1 f^2 having a free end, as shown, so that said links lift and turn the buckets as the chains pass over two drums arranged above a lower drum, as herein set forth, for the purpose specified.

2. The endless chains F, formed by the combination of the slotted links f^1 f^2 and bolts f^3, the latter being made with a round head at one and a flattened head at the opposite end, substantially as described.

5,269.—*Egg Stand and Boiler.*—EDWARD P. WOODS and DANIEL SHERWOOD, Lowell, Mass., assignors to themselves and CYRUS H. LATHAM.—Patent No. 70,769, dated November 12, 1867.—Division A.

A spiral wire forms the body, having side ribs that also form the legs of the stand, and also cross-bars on the top of the stand. The handle is formed of a number of wires twisted together, then doubled to form the loop, and then united by a compound twist. One of these strands for each holder required is formed into a ring, and the remaining strands are twisted to form the continuation and unite the rings and the bottom of the stand together.

Claim.—As a new and improved article of manufacture, a wire stand or holder, constructed substantially in the manner described, and for the purposes specified.

5,270.—*Egg Stand and Boiler.*—EDWARD P. WOODS and DANIEL SHERWOOD, Lowell, Mass., assignors to themselves and CYRUS H. LATHAM.—Patent No. 70,769, dated November 12, 1867.—Division B.

The handle is formed of a number of wires twisted together, then doubled to form the loop, and then united by a compound twist. The wires are then separated, and one strand, for each holder or ring required, is formed into a ring. The remaining strands are twisted together and continued to, and united with, the bottom of the stand.

Claim.—The combination with a stand or holder made of twisted wire of the compound twist shown in the handle A, for doubling and uniting the twisted wire together in the construction of the handle, and then separating the wires, to be again twisted for the parts of the stand, substantially as described and specified.

INDEX OF INVENTIONS PATENTED FEBRUARY 4, 1873.

[The numbers in parentheses denote the classification of patents.]

Anchor, (138,) W. W. Smith 135,450
Auger, earth, (51,) Beach and Hanson 135,509
Augers, operating earth, (51,) Beach and Hanson 135,510
Bag, traveling, (102,) R. Schmitt 135,496
Bale tie, (7,) F. Cook 135,526
Bed bottom, (69,) C. Penfield 135,580
Bed, cot, (69,) L. B. Morse 135,573
Bee hive, (9,) Simmons and King 135,493
Bee hive, (9,) W. Lehman 135,566
Belt, driving, (81,) W. R. Colton 135,409
Belt fastening, (81,) T. Ruediger 135,492
Bird cage, (170,) O. Lindemann 135,567
Board, straw or mill, (109,) J. L. Thomson 135,458
Boats, device for pitching, (137,) W. H. Richardson 135,490
Boiler attachment, wash, (138,) M. Martin 135,569
Boilers, low water alarm for steam, (146,) Brown and Foskett 135,519
Bolt, (24,) E. M. Judd 135,560
Bolt cutter, (100,) J. Tomlinson 135,497
Bolts, cutter head for pointing the ends of, (14,) O. C. Burdict 135,520
Boot and shoe, (16,) Rogers and Felton 135,591
Boot and shoe lasting machine, (16,) C. W. Glidden 135,539
Boot and shoe lasting machine, (16,) C. W. Glidden 135,540
Boot and shoe soles, machine for shaping the edges of, (16,) C. W. Glidden 135,538
Box for preserving cake and bread, (83,) A. R. Ledoux 135,433
Broom head, (32,) B. C. Cook 135,385
Brushes, manufacture of, (22,) A. C. Estabrook 135,415
Buckle, harness tug, (83,) F. Seifert 135,401
Cam grooves, machine for dressing, (100,) Pratt and King 135,594
Canteen, (162,) E. Kelly 135,437
Car coupling, (122,) Fox and Howarth 135,537
Car coupling, (122,) J. E. Hitt 135,552
Car starter, (122,) Lamberton and Lenman 135,564
Car, stock, (121,) G. A. Egan 135,530
Car axle lubricator, (192,) G. A. Brannan 135,517
Car stake supporter, (192,) Mastermann and Hooper 135,436
Car track, railroad, (192,) W. Youmans 135,614
Car doors, lock for freight, (93,) W. S. Brewster 135,400
Cars, combined seat and desk for railroad, (62,) W. C. Huffman 135,557
Cart, excavating, (51,) W. Harlen 135,546
Cements, compound for hydraulic, (153,) A. Pfund 135,582
Cheese hoop, (45,) G. B. Boomer 135,514
Cheese skipper extractor, (45,) C. Green 135,540
Cigar mold, (160,) F. C. Miller 135,572
Cloth steaming machine, (37,) H. S. Green 135,543
Clothes pin, (91,) W. Wellington 135,501
Clothes wringer, (91,) G. S. Prindle 135,585
Coal scuttle, (154,) G. Howland 135,554
Cooking utensil, (154,) J. Mansfield 135,483
Cotton cleaner, (41,) J. Ralston 135,586
Cotton gin, (41,) O. Murray 135,485
Cotton laps, machine for making, (28,) T. C. Craven 135,529
Cradle and rocking chair, combined, (62,) E. Hambujer 135,425
Cultivator, (43,) B. C. Bradley 135,401
Cultivator, corn, (43,) I. Emrick 135,414
Cupboard, refrigerating, (58,) J. Polhamus 135,442
Cupboard and extension table combined, (62,) B. F. Partridge 135,440
Curtain fixture, (62,) S. Ker 135,562
Curtain fixtures, cord tightener for, (62,) H. L. Judd 135,561
Dentist's stool, (46,) L. W. Lyon 135,435
Depurator, tooth and gum, (156,) J. D. Wingate 135,619
Digger, potato, (114,) J. W. Innis 135,559
Digger, potato, (114,) Wright and Benedict 135,458
Ditching machine, (114,) R. Starbrick 135,605
Dowel pins, machine for making, (175,) M. Everts 135,416
Drill, ratchet, (100,) J. Swank 135,451
Drilling machine, (100,) E. J. Worcester 135,613
Earth closet, (8,) J. L. Young 135,504
Egg stand and boiler, (88,) Woods and Sherwood, (reissue) 5,269
Egg stand and boiler, (88,) Woods and Sherwood, (reissue) 5,270
Elevating apparatus, (79,) Blakley and Cahill 135,511
Elevator, (79,) J. H. Blohm 135,393
Elevator, (79,) H. S. Stewart, (reissue) 5,268
Elevator, (79,) G. C. Timpe 135,454
Elevator, coal car, (79,) P. H. Lamey 135,565
Elevators, automatic safety lock for, (79,) G. C. Timpe 135,453
Emery, machine for grinding, (70,) H. S. Lucas 135,482
Engine, reversing link motion, (150,) T. L. Crowley 135,410
Engines, automatic relief valve for steam fire, (118,) A. Mayer 135,437
Eraser, black board, (146,) W. S. Read 135,467
Excavator, (51,) J. T. Ham 135,475
Fan, automatic, (165,) C. H. Clark 135,584
Faucet, compression basin, (167,) W. Gordon 135,541
Faucet, self-closing, (167,) M. S. Clark 135,407
Feather renovator, (62,) S. A. Boyett 135,516
Fire kindler, (154,) R. Adams 135,395
Fire kindling, (154,) W. B. Tucker 135,607
Fire arms, breech loading, (18,) M. J. Chamberlin 135,405
Fire places, lining for, (154,) A. J. Redway 135,587
Flour bolt, (57,) F. Render 135,588
Flour bolt, (57,) G. T. and A. Smith 135,496
Fruit jar, (58,) H. Howson 135,430
Furnace, hot air, (154,) J. Fridley, Jr. 135,422
Furnace, smoke burning, (149,) S. A. Ford 135,490
Game apparatus, (143,) A. M. Smith 135,494
Gage, harness maker's, (72,) D. G. Garlock 135,472
Gas apparatus, (66,) H. H. Wainwright 135,455
Gas apparatus, hydrocarbon, (66,) Maring and Mertz 135,568
Gas retort scraper, (66,) L. F. Blair 135,397
Gate, (52,) J. Blinn 135,463
Glass mold, (68,) H. Wickham, Jr. 135,502
Glass, &c., machine for marking designs on, (54,) H. A. Wassell 135,610
Goods, apparatus for washing printed or bleached, (11,) B. G. Brooks 135,518
Governor, (69,) M. Gally 135,423
Grain scourer, (37,) T. Shiveley 135,602
Grate bar, (149,) J. A. Sinclair 135,447
Grinding, scouring, and polishing machine, (70,) A. B. Walters 135,456
Harrow, (73,) H. Cartwright 135,464
Harrow, (73,) C. Smith 135,448
Harvester, (74,) C. Lidren 135,480
Harvester, corn, (75,) H. M. Carter 135,403
Harvester cutter, (74,) Wasson, Powers and Dungan 135,500
Harvester finger bar, (74,) C. A. Smith 135,495
Harvesters, binder's stand and table for, (74,) W. R. Low 135,481
Hat pressing device, (76,) G. M. Osgood 135,577
Hat pressing machine, (76,) Hastings and Desper 135,426
Hat bodies, machine for felting, (76,) Bowden and Shaw 135,399
Heater for locomotives, feed water, (94,) E. Moyel 135,426
Hoe, (141,) H. R. Barnes 135,468
Hoisting apparatus, (79,) J. N. B. Bond 135,513
Hoops, machine for cutting and bending, (40,) J. Dobbins 135,413
Horse power, (150,) J. Müller 135,439
Hub, vehicle, (31,) H. M. DuBois 135,470
Hub, vehicle, (31,) S. McGee 135,570
Ice crusher, (58,) Hudner and Little 135,556
Ice machine, (63,) Norman and Dietrich 135,576
Ice cream freezer, (58,) G. Guinot 135,474
Inhaler, (156,) W. H. Cutler 135,411
Iron and steel, manufacturing, (65,) Bolton and Pedder 135,518
Ironing apparatus, (91,) E. Sumption 135,606
Jack, lifting, (79,) J. R. Hinton 135,551
Jack, carriage painter's, (31,) A. G. Rykert 135,592
Journal, adjustable, (87,) M. Jackson 135,477
Key, folding door, (93,) J. Seibert 135,599
Leather remnants, mode of treating, (92,) B. C. Young 135,615
Lock, combination, (93,) H. Clark 135,523
Loom shuttle, (95,) Sawyer and Wright 135,446
Loom for weaving slats, window shades, &c., (95,) Hastings, Nichols and Merritt 135,427
Looms, machine for shaping the elastic dents of combs for, (95,) M. Robinson 135,444
Mattresses, stuffing for, (62,) F. A. Lane, (reissue) 5,266
Metallic fabric for scouring grain and percolating purposes, (157,) A. J. Vandegrift 135,608
Moccasin, (16,) T. Hersey 135,548
Mop and mop wringer combined, (22,) J. L. Boyden 135,400
Mortising machine, (173,) J. H. Stahl 135,604
Mower, lawn, (75,) S. D. King 135,563
Needle setter, threader, and cutter, (134,) A. Johnston 135,479
Nut lock, (14,) Hood and Coombs 135,553
Organ reed, reed, (103,) J. R. Perry 135,581
Ovals, apparatus for turning, (175,) M. T Boult 135,515
Packing case, (107,) E. A. Pharo 135,509
Paper box, (109,) M. W. Dillingham 135,409
Paper feeding machine, (117,) Schofield and Baker 135,597
Paper feeding machine, (117,) Schofield and Baker 135,598
Paper feeding machine, (117,) Schofield and Baker 135,599
Pavement, wood, (110,) M. H. Alexander 135,408
Peg rasp, (16,) J. W. Foard 135,419
Pencil holder, (146,) G. A. Smith 135,603
Petroleum, device for burning, (149,) F. A. Hull 135,476
Pilotets, machine for pointing, (174,) A. B. Corby 135,487
Piston rods, &c., stuffing box for, (157,) P. W. Richards 135,589
Planter, corn, (133,) A. C. and G. F. Burgner 135,521
Planter, hand corn, (133,) L. H. Richards 135,469
Platform, railway ferry track, (120,) W. P. Halliday 135,545
Plow, wheel, (114,) M. Sattley 135,594
Pot, coffee, (136,) Grigsby and Braselton 135,544
Pot, mustard, (68,) T. M. Schleier 135,595
Power, device for transmitting, (67,) J. C. Clime 135,408
Press, baster and compressing, (7,) G. Ertel 135,533
Press, cotton, (7,) R. Powers 135,498
Propeller, steering, (139,) J. L. Cathcart 135,404
Propeller, vessel, (129,) E. C. Hubbard 135,555
Pump, steam, (118,) J. W. Handren 135,426
Purifier, middlings, (57,) C. E. McNeal 135,571
Railway ferry track platform, (120,) W. P. Halliday 135,545
Railway snow plow, (132,) W. Walker 135,609
Railway switch, (120,) A. W. Cram 135,527
Railway tank feeder, (120,) A. Grochau 135,473
Rod, lightning, (50,) W. B. Munn 135,574
Ruches, setting and sewing, (134,) M. and S. Roggenburger 135,445
Sad iron crimper, (38,) J. Hewitt 135,550
Sash fastener, (94,) J. Bishop 135,396
Saw frame, buck, (131,) W. Clemson 135,402
Saw mills, slab and sliding holder for, (130,) Bersaloux and Prescott 135,596
Sawing machine, (130,) W. Neidecffer 135,575
Sewing machine, (134,) D. S. Alling 135,461
Sewing machine, (134,) J. L. Follett 135,536
Sewing machine chair, (134,) F. Chichester 135,485
Sewing machine feeding mechanism, (134,) C. Parham 135,579
Sewing machine wax thread, (134,) W. H. Johnson 135,631
Shaft bearing, (87,) G. M. Ball 135,594
Shawl strap, (102,) T. R. Dunham 135,530
Shingle machine, (173,) H. Peavey 135,441
Shirt, (38,) O. Gowing 135,424
Shirt bosom, (38,) C. W. Jenks 135,478
Show case, (54,) Arnold and Mers 135,505
Silk, machine for doubling and twisting, (142,) H. A. Chapin 135,588
Spool stand and thread cutter, (38,) L. F. Ward 135,609
Spools, machine for making, (175,) J. F. C. Rider 135,443
Spoon, fork, &c., (88,) G. C. Robinson 135,590
Stirrup, riding, (72,) A. J. Herring 135,547
Stone grinding and polishing machine, (68,) J. Finn 135,535
Stove damper, (154,) J. D. Willoughby 135,611
Stove grate, (154,) S. Duncan 135,471
Stove, heating, (154,) S. Smith 135,449
Stoves, top plate for cooking, (154,) E. R. Wehrle 135,457
Sugar, apparatus for the manufacture of, (155,) S. Dod 135,580
Table slide, extension, (62,) G. Finkbeiner 135,418
Telegraph pole, (52,) C. F. Howes 135,489
Telegraph, printing, (50,) G. Little, (reissue) 5,267
Telegraphs, circuit for chemical, (50,) T. A. Edison 135,531
Ticket punch, (146,) H. W. Hewet 135,549
Tin scraps, and obtaining useful products, treating, (99,) H. Panton 135,578
Tire bender, (60,) J. Tomlinson 135,498
Tobacco, curing, (160,) J. D. Culp 135,409
Tobacco box and match box combined, (160,) C. Remhof 135,488
Torch and fire lighter combined, (154,) P. Ryan 135,592
Toy block, (143,) H. Fairbanks 135,417
Trap, animal, (143,) S. F. Estel 135,534
Tube cutter, (100,) E. Manuel 135,484
Tube, speaking, (158,) C. A. Fredericks 135,484
Vehicle wheel, (31,) H. B. Leckenby 135,434
Ventilator, (166,) G. R. Barker 135,567

Wagon brake, (31,) R. Roberts 135,491
Watch, winding and setting, (36,) C. E. Jacot 135,559
Water wheel, turbine, (168,) A. Wreaish 135,562
Water wheel, turbine, (168,) P. W. Yarrell 135,459
Water wheel bucket, turbine, (168,) S. L. Dewsey 135,412
Wrench heads, die for making, (168,) L. Chapman 135,406
Wringing machine, (91,) H. Glass, (reissue) 5,265

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 4, 1873.

Adams, J. S., assignee 135,570
Adams, R., Fire kindler 135,395
Alexander, M. H., Wood pavement 135,460
Alling, D. S., Sewing machine 135,461
Arnold, A., and H. Mers, Show case 135,505
Bailey Washing and Wringing Machine Company, assignee, (reissue) 5,265
Baker and Schofield 135,597, 135,598, 135,599
Ball, G. M., Shaft bearing 135,506
Barker, G. R., Ventilator 135,507
Barnes, H. E., Hoe 135,402
Barsaloux, J., and G. A. Prescott, Slab and sliding holder for saw mills 135,508
Beach, W. H., and C. N. Hanson, Earth auger 135,509
Beach, W. H., and C. N. Hanson, Means of operating earth augers 135,510
Benedict and Wright 135,458
Blaknall, E. J., assignee 135,586
Bishop, J., Sash fastener 138,396
Blair, L. F., Gas retort scraper 135,397
Blakley, M. A., and J. Cahill, Elevating apparatus 135,511
Bliss, J., Gate 135,463
Blohm, J. H., Elevator 135,398
Bolton, O., Jr., and J. Pedder, Manufacturing iron and steel 135,512
Bond, J. M. B., Hoisting apparatus 135,513
Boomer, G. B., Cheese hoop 135,514
Boult, M. T., Apparatus for turning ovals 135,515
Bowden, J., and R. Shaw, machine for felting hat bodies 135,399
Boyden, J. L., combined mop and mop wringer 135,400
Boyett, S. A., Feather renovator 135,516
Bradley, B. C., Cultivator 135,401
Brannan, G. A., Car axle lubricator 135,517
Braselton and Grigsby 135,544
Brewster, W. B., Lock for freight car doors 135,402
Brooks, B. G., Apparatus for washing printed or bleached goods 135,518
Brown, J. R., and W. A. Foskett, Low water alarm for steam boilers 135,519
Burdict, O. C., Cutter head for pointing the ends of bolts 135,520
Burgner, A. C. and G. F., Corn planter 135,521
Burns, W., assignee 135,503
Cahill and Blakley 135,511
Campbell, W. H. W., assignee 135,603
Carter, H. M., Corn harvester 135,403
Cartwright, H., Harrow 135,464
Cathcart, J. L., Steering propeller 135,404
Chamberlin, M. J., Breech loading fire arm 135,405
Chapin, H. A., Machine for doubling and twisting silk 135,522
Chapman, L., Die for making wrench heads 135,406
Chichester, F., Sewing machine chair 135,465
Clark, C. H., Automatic fan 135,524
Clark, M. S., Self-closing faucet 135,407
Clarke, H., Combination lock 135,523
Clemens, W., Beak saw frame 135,408
Cline, J. C., Device for transmitting power 135,466
Collins Company, assignee 135,406
Cotton, W. R., Driving belt 135,409
Cook, B. C., Broom head 135,525
Cook, F., Bale tie 135,526
Coombs and Hood 135,853
Corby, A. B., Machine for pointing pickets 135,467
Cram, A. W., Railway switch 135,527
Craven, T. C., Machine for making cotton laps 135,528
Crowley, T. L., Reversing link motion engine 135,410
Culp, J. D., Curing tobacco 135,468
Cutler, W. H., Inhaler 135,411
Denney, S. L., Turbine water wheel bucket 135,412
Denyer and Hastings 135,498
Diedrich and Norman 135,576
Dillingham, M. W. Paper box 135,469
Dobbins, J., Machine for cutting and bending hoops 135,413
Dod, S., Apparatus for the manufacture of sugar 135,529
Dubois, H. M., Vehicle hub 135,470
Duncan, S., Stove grate 135,471
Dungan, Wasson and Powers 135,500
Dunham, T. E., Shawl strap 135,530
Durham, N. A., assignee 135,594
Edison, T. A., Circuit for chemical telegraphs 135,531
Egan, G. A., Stock car 135,532
Emrick, L., Corn cultivator 135,414
Ertel, G., Beater and compressing press 135,533
Estabrook, A. C., Manufacture of brushes 135,415
Estell, S. F., Animal trap 135,534
Everts, M., Machine for making dowel pins 135,416
Fairbanks, E., Toy block 135,417
Fairchild, F. H., assignee 135,570
Felton and Rogers 135,501
Fitler, W., assignee 135,470
Finkbeiner, G., Slide for extension tables 135,418
Finn, J., Machine for grinding and polishing stone 135,535
Florence Manufacturing Company, assignee 135,415
Feard, J. W., Peg rasp 135,419
Follett, J. L., Sewing machine 135,536
Ford, S. A., Smoke burning furnace 135,420
Foskett and Brown 135,519
Fox, F., and F. A. Howarth, Car coupling 135,537
Fredericks, C. A., Speaking tube 135,421
Fridley, J. Jr., Hot air furnace 135,422
Gally, M., Governor 135,423
Garlock, D. G., Harness maker's gage 135,472
Glass, H., Wringing machine, (reissue) 5,265
Glidden, C. W., Machine for shaping the edges of boot and shoe soles 135,538
Glidden, C. W., Boot and shoe lasting machine 135,539
Glidden, C. W., Boot and shoe lasting machine 135,540
Gordon, W., Compression basin faucet 135,541
Gowing, O., Shirt 135,424
Green, A. M., assignee 135,542
Green, C., Cheese skipper extractor 135,542
Green, H. S., Cloth steaming machine 135,543
Grigsby, B., and T. C. Braselton, Coffee pot 135,544
Grochan, A., Railway tank feeder 135,473
Guinot, G., Ice cream freezer 135,474
Guy, G., assignee 135,484
Gwyn, E., assignee 135,503
Hall, N. B., assignee 135,586
Halliday, W. P., Railway ferry track platform 135,545
Ham, J. T., Excavator 135,475
Hambujer, E., Combined cradle and rocking chair 135,425
Handren, J. W., Steam pump 135,426
Hanson and Beach 135,509, 135,510
Harles, W., Excavating cart 135,546
Harrington, G., assignee 135,531
Harrison, C., assignee 135,467
Hart, B. E., assignee 135,602
Hastings, E. B., W. E. Nichols and W. L. Merritt, Loom for weaving slats, window shades, &c 135,427
Hastings, E. B., and J. Desper, Hat pressing machine 135,428
Herman, L., assignee 135,506
Herring, A. J., Riding stirrup 135,547
Hersey, T., Moccasin 135,548
Hewet, H. W., Ticket punch 135,549
Hewitt, J., Sad iron crimper 134,550
Hinton, J. H., Lifting jack 135,551
Hitt, J. E., Car coupling 135,552
Hood, H. P., and W. Coombs, Nut lock 135,553
Hooper and Masterman 135,426
Howarth and Fox 135,537
Howes, C. F., Telegraph pole 135,429
Howland, G., Coal scuttle 135,554
Howson, H., Fruit jar 135,430
Hubbarb, E. C., Propeller for vessels 135,555
Hudner, F., and J. R. Little, Ice crusher 135,556
Huffman, W. C., Combined seat and desk for railroad cars 135,557
Hull, F. A., Device for burning petroleum 135,476
Innis, J. W., Potato digger 135,558
Jacot, C. E., Winding and setting watches 135,559
Jackson, M. Adjustable journal 135,477
Jackson, R., assignee 135,480
Jenks, C. W., Shirt bosom 135,478
Johnson, W. H., Wax thread sewing machine 135,431
Johnston, A., Needle setter, threader, and cutter 135,479
Jones and Nimick, Manufacturing Company, assignee 135,600
Judd, E. M., Bolt 135,560
Judd, H. L., Cord tightener for curtain fixtures 135,561
Kelly, R., Canteen 135,432
Kendall, E., assignee, (reissue) 5,266
Kendrick, A. W., assignee 135,534
Kennedy, T., assignee 135,541
Ker, S., Curtain Fixture 135,562
King, S. D. Lawn Mower 135,563
King and Pratt 135,564
King and Simmons 135,493
Lamberton, W. W., and D. R. Lemman, Car starter 135,564
Lamey, P. H., Coal car elevator 135,565
Lander, P. C. assignee 135,481
Lane, F. A., Stuffing for Mattresses, (reissue) 5,266
Latham, C. H., assignee, (reissue) 5,269, 5,270
Leckenby, H. B., Wheel for vehicles 135,434
Ledoux, A. R., Box for preserving cake and bread 135,433
Lehman, W., Bee hive 135,566
Lemman and Lamberton 135,564
Lidren, C., Harvester 135,480
Lindemann, O., Bird cage 135,567
Little, G., Printing telegraph, (reissue) 5,267
Little and Hudner 135,556
Longley, C. H., assignee 135,594
Low, W. R., Binder stand and table for harvesters 135,491
Lucas, H. S., Machine for grinding emery 135,492
Lyon, I. W., Dentists' stool 135,435
Mansfield, J., Cooking utensil 135,483
Manuel, E. Tube cutter 135,484
Maring, L., and E. Mertz, Hydrocarbon gas apparatus 135,568
Martin, M., Wash boiler attachment 135,569
Masterman, W. H., and W. T. Hooper, Car stake supporter 135,436
Mayer, A. Automatic relief valve for steam fire engines 135,437
McCambridge, A. assignee 135,541
McCullough, J. G., assignee 135,597
McGee, S., Hub for vehicles 135,570
McKeown, M. C., assignee 135,447
McNeal, C. E., Middlings purifier 135,571
McNeal, S. D., assignee 135,542
Merritt, Hastings and Nichols 135,427

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. Fifty-two volumes per year (an issue takes place every Tuesday) was found to fill up the shelves of the libraries so fast as to make the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office; and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c	5	Manures	96

COMMISSIONER'S DECISIONS.

HOVEY *vs.* MULLER *et al*—*Interference.*

[*Appeal from the Principal Examiner in the matter of the interference between the applications of S. D. Hovey, F. H. Muller, and Philip Hufeland, and the patent of Wm. K Evans, for alleged* IMPROVEMENT IN LEAD-PENCILS.—*Decided February* 10, 1873.]

After the determination of an interference a new one should not be declared, without the order of the Commissioner, between the application of the successful party and applications filed by the other parties which were not included in the first interference, although they claim a feature shown in the successful application but not claimed in it.

The successful party should have his patent issued to him upon disclaiming the feature in question as being embraced in another application filed by him, if such is the case.

THACHER, *Acting Commissioner:*

This is an appeal from a decision of the Examiner denying a motion to dissolve the interference.

The subject-matter involved is presented in two claims, one covering the invention to which Hufeland was declared to be entitled in a former interference, and another, subordinate to the first, relating to the particular manner of finishing up the pencil. Although the latter device was shown, the claim never was incorporated in the application of Hufeland formerly in interference, but has been inserted in another application, which is also included in the new interference. Evans has filed a concession acknowledging priority in favor of Hufeland. The remaining parties, Hovey and Muller, were also parties to the former interference. Hufeland now moves to dissolve the interference so far as his earlier application is concerned, so that he may be allowed to receive a patent for the invention to which he has been declared entitled.

The Examiner errs in his statement of the subject-matter of the former interference. It was not "the broad combination of a wooden pencil, a paper tube, and an eraser." It was distinctly stated in the decision of the case that the subject-matter was limited by the declaration of interference to the particular invention shown and described by Hufeland and Illfelder; that Hufeland was entitled to the patent for this invention; and furthermore, that it was neither shown in the application of Hovey nor proved ever to have been invented by him. Muller had withdrawn from the case before hearing. [*Hovey* vs. *Hufeland et al.*, OFFICIAL GAZETTE, vol. 2, p. 493.] This decision was a final adjudication of the case between Hufeland and all other parties to the interference, and a new interference ought not to have been declared with any of them, except under the rules providing for new trials. It does not appear that the new cause has been instituted in accordance with these rules No motion has been made for new trial, no information filed calling for such action by the Office. The Examiner appears to have acted without cause and on his own motion. His action was entirely wrong, except as to Evans, with whose patent an interference was proper, because he was not joined in the former.

Hufeland's right to this invention cannot be questioned in an interference with the same parties as before, but involving only the subordinate claim, and there is therefore no reason for withholding the patent for it, pending the issue of such interference, although the subject-matter is shown in the application. But to remove all objection on this score, Hufeland should file a disclaimer to the second claim, stating that it is the subject-matter of another application. Evans having conceded priority to Hufeland, the interference should be dissolved so far as the subject-matter of the former interference is concerned.

The decision of the Examiner is overruled, and he is instructed to send forward the earlier application of Hufeland for issue, upon the filing of the disclaimer required above.

LAWTON & BLISS.—*Extension.*

[*In the matter of the application of Lawton & Bliss for extension of patent No. 23,033, granted February 22, 1859, reissued December 21, 1869, No. 3,728, for* HOSE-COUPLING.—*Decided February 6, 1873.*]

A case in which the patent and reissue have been sustained in Court, but an extension is refused on the ground that the original patent and reissue were negligently granted, being infringements on a prior patent which was not before the Court.

LEGGETT, *Commissioner:*

This case fails at the first step in its consideration. It appears by reference to the rejected application of V. Fogerty, filed May 19, 1868, cited by the Examiner, that the device was not new at the date of the original grant of the patent. Yet the patent was not only granted, but it has been reissued, litigated, and sustained in Court. It is now for the first time suspected to be defective. These facts call for a close scrutiny and a careful comparison of the patent and reference, which I have made, and I fully concur with the Examiner's opinion that the two cases show substantially identical devices. Fogerty's application, it appears, was not before the Court. If it had been it must obviously have defeated the patent, for the reissued claims are as exactly applicable to Fogerty's coupling as to the patentees. The only difference between the two devices is that the latch in one is held in place by a spring, and in the other by a screw; but the patentee does not limit himself to the use of a screw, and if he did it would be immaterial. The common screw and the common spring, when used merely for the simple function of pressing and holding a latch in place, are as perfect mechanical equivalents as it would be possible to mention. The extension must be refused for want of novelty in the device at the date of the grant of the patent.

AUGUSTUS ADAMS.—*Appeal.*

Appeal from the Board of Examiners-in-Chief in the matter of the application of Augustus Adams for a patent for an alleged IMPROVEMENT IN CULTIVATORS, *filed January 24, 1873.—Decided February 1, 1873.*]

ARTICLE OF MANUFACTURE—PATENTABILITY.

A claim for an article of manufacture may be embraced in the same application with other claims.

Although a production is called an "article of manufacture" it must possess the same requisites for patentability as in other cases, and have the same evidence of invention and novelty.

TEACHER, *Acting Commissioner:*

Applicant presents two claims—the first for a draft-hook of peculiar construction "as a new article of manufacture," and the second for what may be construed as a combination of this hook with several other devices.

The Examiner refuses to consider both claims in the same application, taking the broad ground that "an article of manufacture" must be covered as an entirety by a single claim, and that no other claim can be entertained in the same application.

It is a little remarkable that this position should be again assumed after the decision of the Commissioner in the case of E. R. Sumner, C. D. 1871, p. 180, in which this doctrine was strongly condemned in an appeal from this same Examiner, on nearly the same question. It is true that was not a precisely parallel case, but the principle announced undoubtedly applies to the present application, and should have controlled the Examiner in his action thereon.

The error is occasioned by a mistaken impression as to the phrase "article of manufacture." A strange hallucination appears to exist in the minds of many as to the effect of these words and their presence in a claim is supposed, in some miraculous manner, to change the nature of the invention. This is all a mistake. The same rules apply in determining the patentability of an article of manufacture as in any other case—there must be the same evidence of invention, the same proof of novelty.

Suppose the words "article of manufacture" stricken from the first claim in this application and the device claimed simply as a draft-hook, the nature of the invention and the character of the claim would not be changed in the least; but no one would then think of objecting to the second claim because the hook had been claimed as an entirety in the first. This is precisely what the claim covers in its present form, and the error of the Examiner's decision is just as palpable in the one case as it would be in the other.

I remark in conclusion that the combination of parts mentioned in the second claim appears to be perfectly legitimate; but that, if any of these parts are not represented by the model, it should be amended by incorporating the missing devices.

The decision of the Examiner is overruled, and he is instructed to proceed with the examination of the case.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

THE EICKEMEYER HAT-BLOCKING MACHINE COMPANY *vs.* H. O. PEARCE *et al.*

[*In Equity.—Before Blatchford, Judge.—Decision January 31, 1873.*]

PATENT OF EICKEMEYER—MACHINE FOR STRETCHING HAT-BODIES—PRIOR INVENTION—VALIDITY OF REISSUES.

A machine for stretching hat-bodies, consisting of a skeleton-ribbed former carrying the hat-body to be stretched, and of a series of external rollers arranged concentrically with the axis of the ribbed former, and acting upon the outside portions of the hat-body in opposition to the internal action of the ribs of the skeleton-former, and in the center of the recesses between such ribs, is infringed by a machine in which the external stretching device consists of fixed round-edged surfaces, although with such a device, differently from the rollers, the stretching of any part of the fabric which has once begun continues until all parts are released from tension.

That the defendants have added some features of construction and operation which are not found in the plaintiff's patent, whereby the machine may be improved, cannot relieve the defendants from the charge of infringing the patent, in view of their use of the inventions covered by the claims.

Although prior to Eickemeyer's invention, Hutchinson had stretched hat-bodies between two detached ribbed formers, laid one over the other, yet his devices were practically useless, not being combined into an organized machine. They lacked the combination and arrangement which Eickemeyer made, and which secures circumferential equality of action of the stretching devices on the material, the requisite intervention of the ribs between the stretching devices, and accuracy of operation by means of the concentric approach to and recession from each other of the ribs and stretching devices.

Detached instruments never combined into an organized machine, and not operated continuously, but broken in part after a few trials and then laid away and never used thereafter, cannot avail to defeat a patent upon an operative machine in which those hand devices appear as elements of the combination.

There was no *mechanical combination* of Hutchinson's stretching devices as he used them.

It is not a good objection to the claims of a reissue to set up that these claims were not intended to be made when the original was taken out.

A suit under the reissue, granted December 1, 1868, of letters patent originally granted to Rudolph Eickemeyer, February 28, 1865, for an improvement in machines for stretching hat-bodies, brought by The Eickemeyer Hat-Blocking Machine Company against Hosea O. Pearce, Charles Hall, the Sheldon Hat-Blocking Company, Archibald T. Finn, and Joseph H. Plume.

The invention covered by complainants' patent and the defenses set up, are fully stated in the opinion of the Court.

At the same time with the above suit there was submitted the case of the Eickemeyer Hat-Blocking Machine Company against William H. Tweedy, Thomas E. Tweedy, John E. Dann, Edmund T. Tweedy, the Sheldon Hat-Blocking Company, Archibald T. Finn, and Joseph H. Plume, the Court holding in this case that the so-called "Sheldon" machine was an infringement of the first, second, third, and fourth claims of the reissued Eickemeyer patent, under which the suit was brought.

[*Geo. Gifford,* for complainants.

C. M. Keller, for defendants.]

BLATCHFORD, *Judge:*

This suit is brought on reissued letters patent granted to the plaintiffs, as assignees of Rudolf Eickemeyer, December 1, 1868, for an "improvement in machines for stretching hat-bodies," the original letters patent having been granted to said Eickemeyer, February 28, 1865. The specification, which is signed by Eickemeyer, says:

"In the manufacture of felt hats, the bodies having been formed of a conical shape and subjected to the process of felting, termed by hatters 'sizing,' retain their conical form and require to be stretched in the tip and crown, and also at the brim, to enable the hats to receive and maintain the form subsequently given to them by the operation of blocking. The hat-body being of a conical form, rounded at the tip, is nevertheless made with reference to the hat to be produced, and the different parts of it which are afterward to be developed into the 'tip,' 'square,' 'side-crown,' 'band,' and 'brim' of the finished hat are distinguished by imaginary lines or zones around the hat-body, and the same names applied to them, the lower part of the sides being termed the 'brim,' the upper part of the sides the 'side-crown,' the line of division between the side-crown and brim the 'band,' the rounded upper part the 'tip,' and the dividing line between the tip and side-crown the 'square.' In stretching hat-bodies for blocking, the 'band' is not generally stretched circumferentially, or but slightly stretched, the stretching being required in the crown and tip to produce the square or angular corner of the cylindrical or bell-crowned hat, and at the brim in order that the latter may lie flat or at right angles, or nearly so, to the side-crown when blocked; and it is necessary that the body shall be stretched more in these parts which require stretching than would be sufficient to conform it to the shape of the hat-block, because if not overstretched before blocking the hat will shrink when, in wear, it is exposed to moisture, and tend to resume its conical shape, but if overstretched and suffered to shrink to the block, will retain its figure afterward, under ordinary wear and exposure. In stretching a hat-body for square-crowned hats the upper part of the hat-body is circumferentially stretched most at the square or angle of intersection between the side-crown and tip, beginning to stretch gradually from the center of the tip and from the band, and increasing toward the square. The lower part of the body is stretched circumferentially most at the edge of the brim, beginning to stretch gradually from the band. This stretching operation has hitherto been commonly performed by hand, notwithstanding the attempts that have been made to use expanding blocks or expanding devices inside of the bodies for stretching the tips or crowns. Hat-bodies are generally made of unequal thickness from tip to brim, but of equal thickness, as near as may be, in the direction of the circumference, and the operation of stretching, sometimes called 'wet-blocking,' by hand requires great skill and care to stretch the parts requiring to be stretched, and preserve the requisite circumferential equality of thickness of the body, without overstraining or tearing the hat. The object of my invention is to perform this operation of stretching hat-bodies by machinery, and to this end I have invented the new and improved machine hereinafter described, whereby both the tip and brim, or either, may be properly stretched by the operation of the machine.

"My said invention of a new and improved machine for stretching hat-bodies consists generally of a radially-ribbed or skeleton former, whereon the hat-body is placed to be stretched, and the ribs of which act as internal supporting and stretching surfaces, and a series of external stretching devices which act upon the outside portions of the hat-body that are to be stretched, in opposition to the internal action of the ribs of the skeleton former, and between the lines of support of the same, the internal and external supporting and stretching devices being so combined and arranged, with relation to each other and the work to be done, that when they are brought together with force they operate to stretch the hat-body embraced between them in the required places to develope the desired shape of the hat; and for the purpose of holding the hat-body in place upon the former, so that the proper portions will be stretched, a clamping-ring is also combined with the machine. I have also made the exterior pressing or stretching devices radially adjustable in position, relatively to the axis of the ribbed skeleton former, to accommodate the variations of form required; and, in order to vary the degree of stretching of either the tip or brim at pleasure, I have made the external pressing or stretching devices independent of each other and independently adjustable. It will be observed, upon inspection of the machine as illustrated in the drawings, that, although the general principle and mode of operation of the parts of the machine which act to stretch the tip are the same as in those parts that act to stretch the brim, the adaptation and arrangement of the parts for the two operations are different. The ribs which support the tip have curved or otherwise inclined surfaces to conform to the rounded tip of the hat-body, and the ribs themselves are arranged so that the recesses between them extend inward to the axis, or nearly so, in order to give room for the portions of the tip and side-crown that are pressed in by the external stretching devices, and the external stretching devices converge closely together to act upon the upper surface of the tip to be stretched. The ribs which support the brim have straight surfaces radiating from a circle or cylinder of the diameter of the band, and the recesses do not necessarily extend inside of that circle or cylinder, which may be the hub or support of the ribs of the former. The ribs are more in number than the ribs which support the tip, because of the greater surface of the brim to be stretched by them, and the external stretching or pressing devices are not converged together so closely as those which act upon the tip; and it will also be observed that the construction and arrangement, respectively, of the parts for stretching the tip and brim of the hat-body differ so much that neither will perform the office of the other, although both will perform their offices at the same time upon the same hat-body. For the purpose of securing circumferential equality of action of the stretching devices upon the portions of the hat-body to be stretched, and for convenience and accuracy of adjustment, and facility of operating the stretching devices in a practical machine, I have mounted the internal stretching devices which constitute the skeleton or ribbed former concentrically upon the upper end of a vertical sliding spindle, which is moved up and down in guides, in a frame, by a lever, and have attached the exterior stretching devices to the frame in positions concentric to the axis of the ribbed former, so that the latter may be lowered to put on and take off the hat-body, and lifted when the hat-body is put on, to bring the parts together so as to stretch all the parts operated upon equably in the direction of the circumference of the hat-body. If the exterior and interior devices which act upon the hat-body to stretch it were not guided in this or some equivalent manner, parts of a given zone of the circumference of the body would be apt to stretch more than others, according to their texture, but by causing the stretching-surfaces to act equably, by means of the frame and guides, uniformity in stretching is secured, as far as practicable in such operations."

Then follows a description of the construction of the mechanism, with references to three figures of drawings, figure 1 being a vertical central section of the machine; figure 2, a plan of the radially ribbed or skeleton former, and the lower series of stretching-rollers; and figure 3, a plan of the arrangement of the upper series of stretching-rollers. There is an upright frame, on the top of which is a stationary horizontal table having a central circular opening, under and partly within which is situated the skeleton-former, made of wood or other suitable material. This former has its vertical profile of conical or other form, corresponding with that of the hat-body before the stretching operation; and a portion of it, at about the middle of its height, is of complete circular form in its horizontal section, but above and below this portion it has a number of ver-

tical recesses, between which is left a corresponding number of equidistant radial ribs, the edges of which ribs form the profile of the former. The former is secured firmly and concentrically upon the upper end of a vertical spindle, which is arranged to slide up and down in guides in the center of the frame concentric with the opening in the said horizontal table, and which has applied to it a lever or treadle, by which it can be lifted up to raise the former. A metal clamping-ring, the interior of which is of such size and form as to fit the circular portion of the former between the upper and lower ribs, is attached by vertical rods to and below a headpiece of such weight as to be capable of producing the requisite degree of pressure to hold a hat-body upon the former. These rods work up and down by sliding through guides in a stationary horizontal plate, which is supported by vertical pillars upon the said horizontal table, and the clamping-ring is thereby kept concentric with the former. Such ring is supported, when not supported by the former, by means of a vertical screw which screws through a tapped hole in the headpiece, and the lower end of which, bearing upon said horizontal plate, prevents the ring from descending below a given position. A series of thin round-edged rollers, corresponding in number with the upper recesses and ribs of the former, is arranged above the horizontal line of the circular portion of the former, radial to the axis of the former and clamping-ring and opposite the centers of said recesses. The axles of these rollers are supported in hangers which are secured by screws to the said horizontal plate, said screws passing through radial slots in said plate, to enable the rollers to be adjusted toward and from the axis of the former. The surfaces of such ribs and rollers are the stretching-surfaces for the tip and crown of the hat-body. A series of thin round-edged rollers, corresponding in number with the lower recesses and ribs of the former, is arranged below the horizontal line of the circular portion of the former, radial to the axis of the former and clamping-ring, and opposite the centers of said recesses. The axles of these rollers are supported in hangers which are secured by screws to the said horizontal table, the said screws passing through radial slots in the said horizontal table, to enable the rollers to be adjusted toward and from the axis of the former. The surfaces of such ribs and rollers are the stretching-surfaces for the brim of the hat-body. The clamping-ring is so adjusted by the screw which supports it, and the two series of rollers are so adjusted by setting the hangers in which they are supported, that when a hat-body upon the former is in contact with said ring, while said screw rests upon the said horizontal plate, the edges of the two series of rollers are a short distance outside of the profile of the former.

The operation of stretching a hat-body in the machine is as follows: The former is first allowed to descend to such a position as to permit the hat-body to be put on and drawn tightly over it. The hat-body, wet with hot water or steam, is put on and the former is raised up by depressing the outer end of the treadle or lever. When the hat-body comes in contact with the clamping-ring the weight of the ring and of the attached head piece causes the ring to hold the hat-body with sufficient firmness against the circular portion of the former to prevent it from slipping between the ring and the former, and the continued upward movement of the former, produced by a suitable pressure upon the outer end of the lever or treadle, brings the hat-body into contact with the two series of rollers, which are thus made to press upon and stretch the portions of the hat body which are between the rollers and the corresponding ribs of the former into the recesses. Such portions are thereby stretched over the ribs. By this means the hat-body is brought to a suitable shape for blocking and shaping the crown and brim of the hat.

The specification states that fixed round-edged surfaces may be substituted for, and would be the equivalents of, the two series of rollers, but that the inventor prefers to use the rollers, as by preventing friction upon the hat-body they prevent it from being torn in the stretching operation.

The claims are as follows:

"1. In a machine for stretching hat-bodies, a skeleton or ribbed and recessed former, substantially such as is herein described.

"2. The combination and arrangement of the crown and tip supporting-ribs with the upper series of stretching devices, substantially as described, operating to stretch the tip and side-crown of the hat-body between them, substantially in the manner hereinbefore set forth.

"3. The combination and arrangement of the brim-supporting ribs with the lower series of stretching devices, substantially as described, operating to stretch the brim of the hat-body between them, substantially in the manner set forth.

"4. In combination with the supporting-ribs of the skeleton former, the stretching devices, operating, as hereinbefore set forth, to stretch the hat-body between them at one operation, as required for blocking, substantially as described.

"5. The clamping-ring, in combination with the ribs of the skeleton or ribbed former, operating to hold the hat-body thereon during the operation of stretching, substantially as described.

"6. The combination, in a machine for stretching hats, of the skeleton or ribbed and recessed former, a clamping-ring, and a system of stretching arms or rollers, the whole combined and operating substantially as described.

"7. Making the stretching devices for the tip or brim adjustable radially with relation to each other, so as to vary the degree of stretching of either tip or brim, substantially as described."

The defendants use for stretching the tip and side-crown of a hat-body a machine which does not and cannot stretch the brim; and to stretch the brim they use a separate machine, which does not and cannot stretch the tip and side crown. The defendants' tip and side-crown stretcher has ribs which support the tip and side-crown, and a series of stretching devices, which, instead of being rollers, are fixed round-edged surfaces. The ribs and stretching devices operate to stretch the tip and side-crown between them. In the plaintiffs' arrangement, however, the operation is such that the rollers which act upon the exterior of the hat-body and wrinkle or corrugate it inwardly between the ribs of the former, and thus increase its diameter, act on different points in the hat-body in succession, in lines extending toward the base of it, the parts which have been acted upon being relieved from the pressure of contact with the rollers as new parts are brought into such contact. In the defendants' tip and side-crown stretcher the hat-body is placed on a convex-ribbed former, above which is another ribbed former, the ribs of which, when the hat-body reaches the concave part of the latter former, enter between the ribs of the convex former, and the hat-body is wrinkled by the action so as to be increased in diameter. As the convex former continues to be lifted, the ribs act on the different parts of the hat-body in succession; but so far from any part already acted upon being relieved at any time, the stretching of every part, the stretching of which has once commenced, continues so long as there is any stretching done to any part.

The defendants' brim-stretcher has ribs which support the brim, and a series of stretching devices which, instead of being rollers, are fixed round-edged surfaces. The ribs and stretching devices operate to stretch the brim between them. But in the defendants' arrangement there is a convex-ribbed former on which the hat-body is placed, which is formed like the ribs and stretchers of an umbrella, the hat-body being placed on the former when the ribs are in their lowest position. Above this is another ribbed former, and when the brim on the convex former has reached the concave part of the other former the wrinkling commences, by the action of the ribs of one former between the ribs of the other former, and then a hand-lever throws out or expands the ribs of the convex former by an operation like that of opening an umbrella, and the stretching is thereby completed, the ribs of the convex former during the latter operation bearing, in their whole length, on the brim, in lines extending from the band to the outside of the brim. The action in the first part of the operation is like that in the defendants' tip-stretcher, but in the latter part of the operation there is an action not found in such tip-stretcher nor in the plaintiffs' arrangement.

It is shown by the evidence that the defendants' arrangements in their two stretchers, from the fact that the action is on the whole of a given wrinkle at the same time, are better adapted to the stretching of tender hat-bodies, such as those made of fur, as generally made, than is the plaintiffs' arrangement. But while the defendants' arrangements may contain improvements on the plaintiffs' arrangement, yet they embody what is claimed in the second and third claims of the plaintiffs' patent. The defendants' tip and side-crown stretcher has ribs supporting the tip and side-crown, and a series of stretching devices, which ribs are substantially the same as those of the patent, and which stretching devices are substantially the upper series of stretching devices in the patent, when made in the shape of a fixed round-edged surface, as suggested in the patent, and the ribs and stretching devices are combined and arranged substantially as described in the patent. They operate to stretch the tip and side-crown between them, substantially in the manner set forth in the patent. So, too, the defendants' brim-stretcher has ribs supporting the brim, and a series of stretching devices, which ribs are substantially the same as those of the patent, and which stretching devices are substantially the lower series of stretching devices in the patent, when made in the shape of fixed round-edged surfaces, as suggested in the patent, and the ribs and stretching devices are combined and arranged substantially as described in the patent. They operate to stretch the brim between them substantially in the manner set forth in the patent. The defendants' lower formers are radially ribbed. The hat-body to be stretched is placed on them. The ribs of those formers act as internal supporting and stretching surfaces. The defendants have external stretching devices in series, which act on the outside portions o the hat-body that are to to be stretched, in opposition to the internal action of the ribs of the lower formers and between such ribs, and in the centers of the recesses between such ribs. The mechanical combination and arrangement of the internal and external supporting and stretching devices in the defendants' machines, with relation to each other and to the work to be done, are such that the two sets of devices are brought together accurately and automatically, so that their parts interlock properly and stretch the interposed material in the required places, and equality in the action, circumferentially, of the stretching devices on the parts to be stretched and facility of operation are secured. The combination consists in mounting the set of ribs and the set of stretching devices concentrically, with a coincident axis, and moving one set accurately toward the other by mechanical guides, the stretching devices being opposite the centers of the recesses between the ribs. All these features the defendants' machines have in common with the plaintiffs'. These features are essential features in the plaintiffs' arrangement, and are the features covered, as respects the tip-stretcher, by the second claim of the patent, and, as respects the brim-stretcher, by the third claim of the patent. That the defendants have added some features of construction and operation which are not found in the plaintiffs' patent, whereby the machine may be improved, cannot relieve the defendants from the charge of infringing the second and third claims of the patent, in view of their use of the inventions covered by those claims.

The principal ground of defense urged is that, before Eickemeyer made his invention, one John Hutchinson, at Matteawan, New York, invented and constructed, and successfully used, in a crude way, instruments for stretching the tips and the brims of hat-bodies, which instruments had the same mode of operation as that of instruments found in the defendants' machines. The date of Eickemeyer's invention was the summer of 1861. The identical instruments which Hutchinson used are produced. They were used by Hutchinson in 1860. They are, and always were, detached parts, and never were organized into a machine working automatically. Hutchinson's parts to stretch the brim of a hat-body are three in number—a convex conical-shaped former, with ribs; a concave conical-shaped former, with ribs pivoted like the ribs of an umbrella; and a dome-shaped piece. They are manipulated by handling them. The hat-body is placed on the convex former. The concave former is then placed on the top of the hat-body, with its ribs resting on the hat-body. The dome-shaped piece, which is hollow, is then placed over the concave former and forced down so as to drive the ribs of the concave former into the recesses between the ribs of the convex former, and carry the brim in wrinkles toward the axis of the convex former. In the defendants' brim-stretcher the brim is carried in wrinkles away from the axis of the convex former; because the wrinkling is performed by an operation like that of opening an umbrella. In Hutchinson's device the wrinkling is performed by an operation like that of shutting an umbrella. Hutchinson's parts to stretch the tip of the hat-body consist of a concave-ribbed former and a convex-ribbed former, manipulated by hand, and like the two formers in the defendants' tip-stretcher in construction, as ribbed formers, and brought together to stretch the tip between them, placed on the convex former, by pressing the ribs of one former between the recesses in the other former. Hutchinson, in using his brim-stretching devices, employed a lever

which had its fulcrum in a post which formed a part of a building, to make pressure on the top of the dome-shaped piece, the fulcrum being at the end of the lever. There was no organized machine. The description given of the use of the devices is that they were tried to see whether they would block a hat or not; that they were not operated continuously; that sometimes Hutchinson would make an alteration, and then another trial would be made to see whether the alteration was any improvement; that but one brim-stretcher was made, and that of wood, which was broken several times in operating it; that the tip-stretcher was of wood, and was tried on a few tips, and was broken in use and never repaired; that Hutchinson had the idea of constructing a machine embodying the principle of such devices, but had no definite plan as to the appliances by which the machine was to work out such principle; that nothing was done toward carrying out such intention; that the devices were tried in 1860, prior to, but not later than, June; that they were then stowed away in a closet, where old books and papers were kept, in a factory where Hutchinson continued to be employed for two years afterward; and that they remained in that closet, unused, for three years and a half, and were then removed to another place, whence they were taken to be used as evidence in favor of the parties defending this suit. These devices of Hutchinson amounted to nothing, and were practically useless, for the reason that they were not combined in an organized machine. They lacked the combination and arrangement of them which Eickemeyer made, and which secures circumferential equality of action of the stretching devices on the material, and accuracy of operation, by means of the concentric approach to, and recession from, each other, of the ribs and stretching devices. The equable intervention of the ribs between the stretching devices is an essential feature of the patent, due to the mechanical organization. There is no such feature in Hutchinson's devices, because there is no mechanical organization capable of developing such feature. Whether the ribs and stretching devices in Hutchinson's tools will move concentrically or not is a matter of accident, and dependent on the skill of the person handling the tools, and the equability of intervention of the ribs and stretching devices is equally a matter of accident and skill in handling.

There is, therefore, nothing in what Hutchinson did that can interfere with the second and third claims of the patent, which are the only ones involved in this suit. Even if Eickemeyer had seen and known of what Hutchinson did, he would have been entitled to make those two claims. It has been attempted to be shown that Eickemeyer knew of, and saw, Hutchinson's devices. Whether he did or not is of no importance; but the evidence wholly fails to show that he did. Hutchinson's devices amounted to nothing. They needed the addition of what is found in the defendants' machines, and which makes of them combinations that were invented by Eickemeyer. It is a mistake to say that the claims of the plaintiffs' patent cover Hutchinson's instruments. So far as the plaintiffs' patent is concerned, those instruments are free to be used by the defendants in the manner in which Hutchinson used them.

The claims of the original patent granted to Eickemeyer were as follows:

"1. The employment, in the process of stretching hats, of a skeleton or ribbed and recessed former, substantially such as herein described.

"2. The pressing-ring E in combination with the skeleton or ribbed and recessed former, substantially as and for the purpose herein specified.

"3. The employment, substantially as herein described, in combination with the skeleton or ribbed and recessed former, of pressing-rollers K M, or other equivalent pressing devices, operating as herein set forth.

"4. The combination, in a machine for stretching hats, of a skeleton or ribbed and recessed former, a pressing-ring, and a system of rollers, or other equivalent pressing devices, the whole combined and operating substantially as and for the purpose herein specified."

Because Eickemeyer did not, in his original patent, make the claims which are made in the second and third claims of the reissued patent, but only made claims which were substantially the same as the first, fourth, fifth, and sixth claims of the reissued patent, it is argued that he must have seen the devices of Hutchinson. I draw the very opposite inference, for, if he had seen them it would have been in his mind, in taking out his patent, that the upper ribs and upper stretching devices might be used separately from the lower ribs and lower stretching devices, as Hutchinson used his tools, and, with such idea, Eickemeyer would have made, in his original patent, claims like the second and third claims of the reissued patent, which are fully warranted by what is found in the specification and drawings of the original patent. It would not detract a particle from the merit or validity of Eickemeyer's invention if he had seen Hutchinson's tools; but there is no satifactory evidence derived from witnesses, or from the history of the case, to warrant the conclusion that he saw or knew of them.

There is no more warrant for saying, in this case, that Eickemeyer did not intend, in taking out his orignal patent, to make such claims as the second and third claims of the reissued patent, than there is, in every case of a reissue, for saying that claims in the reissue, not found in the original, were not intended to be made when the original was taken out because they were not put in as claims in the original. On this principle there never could be a reissue covering claims not substantially found, as claims, in the original.

The argument on the part of the defendants seems to be founded on the idea that the second and third claims of the reissued patent cover the use of Hutchinson's tools as Hutchinson used them. This is an error. The use of Hutchinson's tools, as he used them, are not combinations of them, such as the second and third claims of the plaintiffs' patent intend and cover. There are no mechanical combinations of Hutchinson's tools when they are used as he used them. The second claim of the reissue does not cover, broadly, the use of the tip-former in connection with the upper series of stretchers, detached from the mechanical combination and arrangement of such former and stretchers, found in the plaintiffs' patent and not found in Hutchinson's tools. So, too, the third claim of the reissue does not cover, broadly, the use of the brim-former in connection with the lower series of stretchers, detached from the mechanical combination and arrangement of such former and stretchers, found in the plaintiffs' patent and not found in Hutchinson's tools.

There must be a decree for the plaintiffs for a perpetual injunction and an account of profits, and an ascertainment of damages, with costs, in respect to the second and third claims of the patent.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,833.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,085.—*Lamps.*—Granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859. Hearing February 12, 1873.

23,097.—*Machines for Crozing and Chamfering Barrels.*—Granted to HIRAM LITTLEJOHN, March 1, 1859. Hearing February 19, 1873.

23,105.—*Construction of Steam-Vessels.*—Granted to JAMES MONTGOMERY, March 1, 1859. Hearing February 12, 1873.

23,152.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,173.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON R. PETERS, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 22, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 19, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 19, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 19, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 19, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CRAMMER, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,643.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Distintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,659.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 9, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,894, 4,895, and 4,896, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,963, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 5,359, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERSHON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tyres.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,096.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,426.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,634.—*Pin-Sticking Machine.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

EXTENSIONS GRANTED.

22,812.—*Improved Machine for Rolling Horseshoe-Iron*, granted to WILLIAM W. LEWIS, February 1, 1859; reissued March 30, 1869, numbered 3,354.

Claim.—1. The combination, in a pair of rolls, of a groove with an inclined bottom and one or more creasers, for the purpose of guilding the iron, and producing a thicker edge on the outside of the shoe, substantially as described.

2. The combination of a pair of grooved rollers with one or more creasers, when the bottom of the groove, or rolling-surface of either roll is eccentric, so as to make the shoes thicker at the heels than at the point or toe, substantially as set forth.

3. The combination, with a pair of rolls, of annular adjustable creasers, substantially as described.

Disclaimer filed February 13, 1873.

Disclaims third clause of claim, as above set forth.

22,941.—*Improvement in Car-Springs*, granted to AUGUSTUS B. DAVIS, February 15, 1859; reissued January 6, 1863, numbered 1,371; and again reissued March 17, 1863, numbered 1,431.

Claim.—1. A box of any suitable form and a plate, C, or its equivalent, adapted to the open end of the said box, and connected to the latter by a bolt or bolts, D, or other suitable fastenings, substantially as set forth, in combination with a series or nest of springs, arranged side by side and free from contact with each other, each spring forming an integral part of the entire elastic medium composed of the whole of the springs, and the latter serving with the said box and plate to constitute an entire single self-contained car-spring, as described.

2. The use within a box, substantially as described, of a series or nest of spiral or coiled springs, when made of iron wire and treated by compression or impact prior to being deposited in the box, as set forth, for the purpose specified.

3. The series or nest of springs, combined with a box and plate so constructed that the compression of the said springs shall be limited and their constant available thereby preserved.

Disclaimer filed February 10, 1873.

Disclaims the following portion of his specification: "Or flat steel bars, the same being coiled or twisted or otherwise bent in whatever manner the constructor may deem most appropriate." Also,

Disclaimer filed February 15, 1873.

Disclaims third clause of claim, as above set forth.

23,011.—*Improvement in Water-Wheels*, granted to N. F. BURNHAM, February 22, 1859; reissued September 1, 1863, numbered 1,530.

Claim.—1. A hub, formed with a concave exterior in any manner, substantially as described, so as to derive a lifting tendency from the entrance of the water and deflect it downward, in the described combination with a bucket formed with a face vertical, or nearly so, at top to receive the direct force of the water, and inclined at bottom to receive its gravitating force.

2. The combination of the chutes or scrolls M M and wheel Q R, constructed as herein described, to adapt the wheel to operate with good effect with any proportionate quantity of water.

23,022.—*Improvement in Molding Covers for Cook-Stoves*, granted to GEORGE W. GARDNER, February 22, 1859.

Claim.—Combining with that part of the pattern which gives form to the recess of the cover, the pivoted projections, as and for the purposes herein set forth.

23,032.—*Improved Steam-Pressure Gage*, granted to T. W. LANE, February 22, 1859.

Claim.—1. So combining the indicating-tube with the pipe, through which the pressure within the boiler is transmitted to the gage that the length of tube in either direction from its junction with the pipe shall not exceed a semi-circle, and placing the tube in such a position that it shall descend at every point toward its junction with, and drain back into the pipe

2. Joining the pipe from the boiler with the indicating-tube at a point between its two ends, and bending the latter as set forth, so that the ends of the tube shall be nearly over the points where its two branches are rigidly supported, whereby the tube is rendered less sensitive to the vertical shocks to which it is subjected.

3. Bending the two portions of the indicating-tube symmetrically, or nearly so, upon opposite sides of a vertical line, as described, and connecting the two extremities of the tube with the lever *i*, as set forth, for the purpose of preventing the horizontal vibrations of the tube from being transmitted to the index-hand.

4. Pivoting the lever *i* to the indicating-tube without attachment to the case, for the purpose specified.

Disclaimer filed February 15, 1873.

Disclaims first, second, and third clauses of claim, as above set forth.

23,034.—*Improvement in Fire-Plugs*, granted to JOSEPH L. LOWRY February 22, 1859; reissued August 14, 1860, numbered 1,026; reissued July 30, 1872, numbered 5,017.

Claim.—1. In a fire-plug a removable hose-branch or plug-head, consisting of a vertical screw branch or stem, hose nozzles *p*, with their valves *l*, and the main-valve wrench or key *n f*, essentially as described.

2. A many-way valved fire-plug head for the attachment and supply of several hose at one and the same time, without interrupting the flow through such as are attached, in combination with a communicating supply-chamber of said plug, essentially as described.

3. A many-way valved plug-head or supply hose-branch, in combination with a valved fire plug pipe, essentially as described.

4. The chamber *j*, constructed so as to make it answer the double purpose of a through way for one or more branch pipes, and a readily accessible chamber containing a valve or valves, thus making one pit and one cover common to two, three, four, or more mains, instead of several, as now required, all substantially as set forth.

5. The combination of the fire-plug, with the chamber *j* and its branches, and the valve *v*, arranged for the purpose of effecting a circulation of the water under the valve or the fire-plug, to prevent it from freezing.

6. In a many-way fire-plug, I claim the screw hose-branches *p*, made to form the seats for the valves *b* thereof, as described.

7. The wrench *n f* of the many-valved plug-head or hose-branch, in combination with the valve *v* of the fire plug, as and for the purpose set forth.

8. The removable screw-seat *c* in the ends of the branches or bowls *y*, so as to renew the seats for the valves *b*, when necessary, without disturbing the main or stop cock, access to these seats being through a common chamber, *j*, as herein stated.

DISCLAIMERS FILED.

22,813.—WILLIAM W. LEWIS, Cincinnati, Ohio, as the owner of an undivided half interest in Letters Patent for *Improvement in Horseshoe-Machines*, dated February 1, 1859; reissued March 30, 1869, No. 3,354. Disclaims:

"That part of the claim in said specification which is in the following words, to wit:

'3. The combination, with a pair of rolls, of annular adjustable creasers, substantially as described.'"

22,941.—A. B. DAVIS, Philadelphia, Pa.—*Improvement in Car-Springs*, dated February 15, 1859; reissued January 6, 1863, No. 1,371; again reissued March 17, 1863, No. 1,431. Disclaims:

"That part of the claim in said specification which is in the following words, to wit: 'Thirdly, the series or nest of springs combined with a box and plate, so constructed that the compression of the said springs shall be limited and their constant available thereby preserved.'"

22,941.—A. B. DAVIS, Philadelphia, Pa.—*Improvement in Car-Springs*, dated February 15, 1859; reissued January 6, 1863, No. 1,371; again reissued March 17, 1863, No. 1,431. Disclaims:

"That part of the said reissued patent, which is in the following words, occurring in the body of the specification, to wit: 'or flat steel bars, the same being coiled or twisted, or otherwise bent in whatever manner the constructor may deem most appropriate.' Also to that part of the said reissued patent, which is in the following words, occurring in the body of the specification, to wit; 'or springs otherwise bent.'"

23,033.—THOMAS W. LANE, Meredith, N. H.—*Improvement in Steam-Pressure Gages*, dated February 22, 1859. Disclaims:

"So much of the subject-matter of said patent as is covered by and included in the first, second, and third clauses of the claim of said patent."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 11, 1873.]

6,385.—*Lamp.*—DANIEL ASHWORTH, Kenton county, Ky.

6,386.—*Carpet.*—JOHN H. BROMLEY, Philadelphia, Pa., assignor to JOHN BROMLEY & SONS, same place.

6,387.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,388.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,389.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,390.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,391.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,392.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,393.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,394.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,395.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,396.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,397.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,398.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,399.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,400.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,401.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,402.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,403.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,404.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,405.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,406.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,407.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,408.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,409.—*Shovel.*—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.

6,410.—*Landau Sleighs.*—JOHN C. GOOLD, Altany, N. Y.

6,411.—*Fences.*—JAMES I. HEALEY, Brooklyn, N. Y.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date February 11, 1873.]

1,123.—*Charts and Patterns for Cutting Dresses.*—WILLETT CORNWELL, Philadelphia, Pa.

1,124.—*Medicinal Compound.*—EMIL FRESE, San Francisco, Cal.

1,125.—*Packed Fresh Salmon.*—LEWIS H. NEWTON, Brooklyn, N. Y.

1,126.—*Axes and Hatchets.*—THE COLLINS COMPANY, Collinsville, Conn.

1,127.—*Harvesting-Machines.*—WHITELEY, FASSLER & KELLY, Springfield, Ohio.

1,128.—*Self-Rakes, Droppers, Reels, &c., of Harvesters.*—WHITELEY, FASSLER & KELLY, Springfield, Ohio.

1,129.—*Guard-Fingers, Knife-Sections, &c., of Harvesters.*—WHITELEY, FASSLER & KELLY, Springfield, Ohio.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date February 11, 1873.]

ORIGINAL PATENTS.

135,616.—*Drawing Mechanism for Spinning-Frames.*—REUBEN ACKROYD, Philadelphia, and WILLIAM COCKCROFT, Chester, Pa.

The friction-plate is a substitute for and is designed to accomplish the same object as the usual carrying-rollers, besides supporting the sliver close up to the bite of the drawing-rollers, preventing roller-laps and avoiding the use of much of the driving mechanism usually employed.

Claim.—The combination, substantially as described, of a friction-plate or plates, A, with the delivering and drawing rolls of a spinning-machine.

135,617.—*Soda Apparatus.*—MATTHEW S. ANDREWS, Somerville, assignor to JAMES W. TUFTS, Medford, Mass.

The rear end of each can rests upon ledges formed upon the side of the casing. The removable portion of the casing is made to slide in grooves at the corners of the apparatus, and is provided at its bottom with openings which fit over the necks of the cocks, so that the cans may be removed without unscrewing any coupling.

Claim.—The removable portion G, in combination with the cocks E and sirup-cans D, all constructed and arranged so the cans can be removed without unscrewing any coupling, substantially as described.

135,618.—*Printing-Press.*—FRANKLIN L. BAILEY, Boston, and JOSEPH WATSON, Everett, Mass.

The depression of the foot-treadle raises the peculiarly-shaped lever, the back of which slides against the frame and throws out the toggle to which the oscillating platen is attached, and near the completion of its stroke presses a secondary lever against a bearing on the toggle-lever to finish the impression.

Claim.—The combination of the lever L, lifter D, the frame E with its inclined plane, against which the lifter D slides, the toggle T, the connecting-rods C C, and the vibrating platen P, substantially as described.

135,619.—*Warping-Machine.*—JOSEPH B. BANCROFT, Hopedale, Mass.

The distance between the attendant and the reed is lessened, thereby facilitating the process of piecing the broken threads. The ordinary guide-rollers are dispensed with and the measuring-roller is made to perform their function, the drop-wires being placed in front of the measuring-roller and a drop tension-roller between it and the reed.

Claim.—The measuring-roll C, the drop-wires or their box D, the slack-take-up roller E, and the reed or guide A, arranged in manner, relatively to each other, substantially as shown and described.

135,620.—*Railroad Gate.*—JOSEPH BRAMBEDARYER, Sr., Campbellstown, Pa.

The gate is operated by the car-wheel flanges through the intervention of a vertically-moving piece, curved arms, rock-shaft, roller-arm, and ring projecting from the pivoted gate-post. The hooks which hold and release the gate in its open and closed positions are also actuated by the same movement of the platform, through a crank-shaft and connecting-rods.

Claim.—1. A vertically-movable platform, B, which is supported upon the upper extremities of levers H H', and guided by loops B', in a structure, A, in combination with springs S', connecting-rods P, link E², and an arm, E', on a rock-shaft, E, the latter carrying an arm, *f*, which acts on a wing, *b*, of the gate C, substantially as described.

2. The hooked latch *a'* on post D², connected by a rod, G, crank *r*, and a rod, E, to lever E', in combination with the platform B and swinging gate C, substantially as described.

3. The hooked latch *a* on post D, connected to the rock-shaft E by means of a rod, F, and crank *h*, in combination with the mechanism described for opening and closing the gate C, substantially as set forth.

4. The beveled wing *b* on the pivoted post of the gate C, in combination with the anti-friction arm *f* on the rock-shaft E, substantially as and for the purposes set forth.

135,621.—*Heating-Stove.*—PHILO D. BECKWITH, Dowagiac, Mich.

The several sections are secured together by bolts or rivets.

Claim.—1. The section A and section B, constructed and secured together by means of bolts or rivets, and the internal flange *b*, substantially as described.

2. The sheet-metal section C fitted into the fire-pot section B and secured thereto by means of bolts or rivets, substantially as described.

3. The sheet-metal sections C and F secured together by means of a ring, E, and bolts or rivets, substantially as described.

4. The top plate or section G secured to the section F by means of lugs and bolts or rivets, as set forth.

135,622.—*Apple-Parer.*—GEORGE BEEBNER, Washington, Mo.

A knife-stock and cutter arranged with a spring passing through the connecting hollow shaft and attached on one of the uprights holding the gear, by which motion is imparted to the machine and to the opposite upright to hold the knife, and by which tension is given to the knife-stock to hold it to the fruit to be pared.

Claim.—A knife-stock consisting of the stock B, formed with a hollow support, *b*, inclosing a spring, C, and carrying a cutter-head, D, and knife E, all constructed to operate as and for the purpose set forth.

135,623.—*Wheel for Vehicles.*—ALBERT L. BLACKMAN, Crots Plains, Tenn.

My wheel can be repaired, the spokes be replaced, and the tire and spokes tightened at any place; the wheel can be taken down without taking the hub from the axle; the tire tightened without cutting; the hub refilled with spokes at will; or any spoke can be replaced without removing the tire or rim.

Claim.—1. Cast cylinder B in its peculiar construction, with the beveled or concave flange or disk E cast with it on its inner or larger end, in combination with the adjustable, beveled, or concaved flange or disk A, that screws on from the front or nut end of the hub, or their mechanical equivalents, the whole constructed and arranged substantially as and for the purposes set forth.

2. The spoke C, with its broad flaring end one way and wedge or key-stone shape the other, in combination with the cylinder B having the flange or disk E on its inner end, and the adjustable disk or flange A screwed on the outer end of cylinder B, or their mechanical equivalents, the whole constructed and arranged substantially as and for the purposes set forth.

135,624.—*Combined Gun-Sheet and Spade.*—WILLIAM E. BLAKE, New York, N. Y.

Claim.—1. A shovel or spade formed of the head and shoulder rest A of a gun-stock, substantially as and for the purpose herein-before set forth.

2. A twist or bend given to the neck B of a gun-stock, substantially as and for the purpose hereinbefore set forth.

135,626.—*Weft-Thread Knitting-Machine.*—CORNELIUS CALLAHAN, Chelsea, Mass., assignor to himself and EDWIN E. SIBLEY, same place.

Alternate needles are pushed outward, to permit the introduction of a weft-thread, by the projection near the upper end of the needle-cylinder, and are brought gradually into line as they approach the knitting-point by moving down a long incline, a projection on the front of alternate slide engaging a projection on the inside of the cam-cylinder.

Claim.—1. The needle-cylinder C having the projection *m* arranged upon it, as described, with reference to the slide-guiding grooves, in combination with the slides *g*, constructed substantially as described, and actuated by a cam-groove, whereby the alternate needles *i*, as they are raised, are thrown out of line with respect to the other needles, and may return again into line when lowered, substantially as set forth.

2. The incline or projection *q* on the inside of the cam-cylinder B, in combination with the needle-slides *g*, provided with inclines or projections *p* and actuated by a cam-groove, whereby the needles *i* are brought back into line with respect to the other needles, substantially as set forth.

3. The cylinder B having the groove *s* with the long gradual incline 17 18, in combination with the cylinder C having the projection *m* and the needle-slides *g*, whereby the needles *i* are brought gradually into line with respect to the other needles as they approach the knitting-point, substantially as set forth.

135,627.—*Weather-Strip.*—ISAAC CASE, Des Moines, Iowa.

The metallic strips composing the device are hinged together and attached to the door in the usual manner. The lever co-operates with the catch to hold the strip up when the door is opened, and is released by contact with the step *f* when the door is closed, allowing the strip to fall.

Claim.—The strips *a a* and *b b*, the catch *c*, the bent lever *d d*, and the step *f*, made, combined, and operated with a door, in the manner described, and for the purposes specified.

135,628.—*Handle for Saws.*—WILLIAM CLEMSON, Middletown, N. Y.

The handle is made adjustable on the pivot.

Claim.—The handle B *B'*, having screws *b b' b'*, in combination with the saw-blade A having the pivot-hole *a* and adjusting concentric slots or series of holes *a' a'*, all constructed and arranged to operate in the manner described.

135,629.—*Ice-Creeper.*—EBENEZER B. COLBY, Franklin, N. H.

A lock mechanism is secured to lips or flanges at right angles to each other, and may be attached to the under and inner sides of a boot or shoe heel by screws through the flanges. The bolt of the locking device is serrated at its outer end, and forms a creeper when thrown down by use of a key.

Claim.—In an ice-creeper, the combination of either or both the lips B C with the box or case A and the serrated spar D, provided with mechanism for operating it, as described.

135,630.—*Evaporating-Pan for Salt, Sugar, &c.*—LEFFERT R. CORNELL, Brooklyn, N. Y.

Claim.—1. An evaporating-pan made up of sections running transversely of the said pan and secured by bolts extending horizontally through ribs or their equivalent attached to the same, substantially as hereinbefore set forth, whereby the length of the pan may be increased or diminished by adding or removing intermal sections, substantially as described.

2. The combination of the sections and half sections A and B with the sections C in the manner described, whereby the said sections and half sections A and B are made to break joints with the sections C C, substantially as described.

3. The combination of the upper and lower sections and the bolts *i*, substantially as described, whereby the said upper and lower sections are firmly secured together without extending the said bolts through the upper sections.

4. Dividing the sections A, B, and C longitudinally and securing them together by flanges and horizontal bolts and flanges, substantially as described, whereby the size of the sections transversely of the pan is reduced and two separate steam-chambers longitudinally of the pan are formed, substantially as hereinbefore set forth.

135,631.—*Bed-Plate for Rag or Paper Engines.*—GEORGE A. COMEN, Leicester, Mass., assignor to himself, ANTHONY HANKEY, and JAMES E. JONES, same place.

The angle-plates are secured in parallel diagonal lines between the side strips.

Claim.—1. The combination, with the bars A B, of the diagonally-arranged metal angle-plates *a* and diagonally wooden strips *b*, both varying in length, and arranged relatively, substantially as shown and described.

2. A bed-plate for rag or paper engines constructed substantially as described, and as shown in Fig. 1 of the accompanying drawing.

135,632.—*Bleaching Buffed Sole-Leather.*—HARRISON W. COTTLE, Lynn, Mass.

Compound consists of saturated solution of hyposulphite of soda, commercial sulphurous acid, and alcohol, which is applied to the buffed leather by means of a sponge.

Claim.—1. The above-described means or process of treating sole-leather, the same consisting in buffing the tanned skin or sole-leather, and subsequently applying to the buffed surface thereof sulphurous acid, or the composition as described, in which such constitutes a material part.

2. The above-described composition for application to buffed tanned skins or sole-leather, as and for the purpose specified.

135,633.—*Steam-Radiator.*—LEWIS S. DANIELS, Foxborough, Mass.

Claim.—The radiator described, consisting of the vertical pipes A B united at the top by the pipe C and at the bottom by the pipe D, the pipe D being provided with the separating-diaphragm E provided at its lower edge with an opening, *e*, for the passage of the water.

135,634.—*Brush-Machine.*—MILES DILLON, Albany, N. Y., assignor to himself and JOHN B. ARMOUR, same place.

A table, with a suitable recess for the reception of the flat brush, is provided with suitable pins and guards to regulate the size of the brush; and also with a detachable leaf. Suspended above the table, in a suitable frame, is the sliding clamping piece that holds the brush in place. To this sliding piece is attached a supplementary piece provided with one or more awls or punches to perforate through the band and brush for the reception of the nails. An envelope is also used to hold the points of the bristles close together, so that the band can be slipped over toward the butts.

Claim.—1. The bristle-table, consisting of the parts A and A', so arranged that the portion A' will be rendered detachable from the portion A, in combination with the guard *b* and gage-pieces *c c*, substantially as and for the purpose set forth.

2. In combination with the table A A' and gage-pieces *c c*, the pin *z*, (one or more,) when arranged to be operated substantially as and for the purpose set forth.

3. The combination of the clamping-piece B with the table A and gage-pieces *c c*, substantially as and for the purpose set forth.

4. In combination with the table A A' and clamping-piece B, the envelope *e e*, when the said envelope is arranged to operate substantially as and for the purpose set forth.

5. The combination of the supplementary piece B' and awls or punches *p* (one or more) with the clamping-piece B and table A, substantially as and for the purpose set forth.

135,635.—*Paint-Brush.*—MILES DILLON, Albany, N. Y., assignor to himself and JOHN B. ARMOUR, same place.

The butt or head of the handle has radial projections, which aid to hold the bristles in position.

Claim.—The arrangement of the several radial feathers *a a* or *a' a'* around the head of the handle of a brush or sash-tool, substantially as and for the purpose set forth.

135,636.—*Show-Card.*—ALEXANDER H. DIXON, Toronto, Canada.

Mounts a fabric on paper, cuts the letters out, and transfers them to card-board.

Claim.—A show-card formed of letters cut from fabric mounted on paper and transferred to pasteboard, as a new article of manufacture.

135,637.—*Machine for Shaving Hoops.*—JAMES A. DOUGLASS and JOHN WAGNER, Chest Springs, Pa.; said DOUGLASS assignor to said WAGNER.

Two revolving cutting-cylinders are placed near each other so as to score the wood to a proper depth, which is afterward removed by shaving-knives.

Claim.—1. The combination of a pair of cutting and feed rolls with planes for shaving the flat surfaces of the hoop, and pressure-rolls used in connection with said planes, all arranged and operating substantially as herein described.

2. The combination of the cutting-rolls, upper and lower sets of plane-bits, pressure-rolls, and edgers, all arranged in a suitable frame-work, and operating substantially as herein described.

135,638.—*Truss.*—CHARLES H. EGGLESTON, Marshall, Mich.

An exterior hollow cup has a small pad upon its interior, secured by a ball-and-socket joint. A clip is arranged upon the outside of the exterior cup, and through this a flat steel spring is passed, to the ends of which a band to encircle the body is secured. A single screw holds all the parts together except the flexible band.

Claim.—1. A truss-pad, composed of a cup or shell, *a*, and a ball, *b*, secured therein by means of a ball-and-socket joint, substantially as herein described.

2. The combination of a cup, *a*, ball *b*, clasp *d*, and plate *g*, when all said parts are secured together by means of a single screw or shank, substantially as herein described.

3. The combination of the pad *a b*, spring *e*, straps *e f*, and the buckles, clasp *d*, slotted plate *g*, and fastening screw or shank for securing the parts together, substantially as herein specified.

135,639.—*Metallurgic Gas-Furnace.*—HIRAM FRANK, Pittsburg, Pa.

Claim.—1. The tile *d d*, placed in the mouth of the furnace for the purpose of dividing the inflowing volume of gas and air into a number of smaller currents, for the purpose of causing their more intimate admixture prior to their entrance into the combustion chamber or bed, substantially as described.

2. The fire-bridge *f*, having a contracted or reduced opening, *g*, in combination with the tile *d d*, for the purpose of causing the more intimate admixture of the inflowing air and gas, substantially as described.

3. The fire-bridge *f*, made removable, substantially as and for the purposes described.

135,640.—*Regenerator-Furnace.*—HIRAM FRANK, Pittsburg, Pa.

The bricks of which the furnace-walls are constructed are made large, so that a multiplicity of joints is avoided, obviating the tendency to leak and the admixture of air and gas. The vertical and transverse flues are formed through the bricks.

Claim.—1. The walls A, constructed, as described, with vertical passages *a* and transverse passages *b*, such passages being made through the brick or tile which compose the walls.

2. The heating-chamber constructed with alternate walls A and chambers B, the former having vertical passages *a* extending between the chamber *c* and the fire-chamber and stack for the passage of the heated gases, and transverse passages *b* extending between the chambers B for the passage of the air to be heated, such passages being made through the brick or tile which compose the walls, substantially as described.

135,641.—*Rotary Sail.*—JULIO E. GARCIA, New York, N. Y.

Longitudinal bars of the frames play in grooved slotted segments that are attached to the shaft or a disk mounted thereon. In these slotted guides the frames are allowed free play in such a manner that the two sails pertaining to each arm will, when the wind strikes them on the inner or hollow side, be spread apart to offer a larger surface to the wind.

Claim.—The frames D D, provided with longitudinal bars *e e*, movable in slots of segments *f*, as and for the purpose described.

135,642.—*Machine for Cutting Stones.*—ALONZO S. GEAR, Boston, Mass.

The rotary wedge or disk splits and chips off any projections in the stone, which the diamond head may cut beneath.

Claim.—1. The above-described rotary cutter-head studded with diamonds, in combination with adjustable mechanism for moving the same vertically and laterally and a movable carrying-bed for feeding the stone to be cut, substantially as set forth.

2. The rotary cutter-head, composed of shaft G, hub H, and sectional rim-pieces P P P studded with diamonds, having a beveled surface, and connected to the hub by means of set-screws or their equivalents, substantially in the manner described, as and for the purposes set forth.

3. The chilled cast-iron rotary wedge or disk K, in combination with a rotary cutter-head studded with diamonds, substantially as and for the purposes set forth.

135,643.—*Sofa-Bedstead.*—JOSEPH B. HARLOW, Portland, Me.

The head-rests are hinged together and also to the stationary and folding frames. The position of the head-rest is regulated by a ratchet-bar operated by a cord. On the front rail is a sliding slotted bar, which has racks on its lower edge which engage with the notched top of the supporters or legs.

Claim.—1. The combination, in a sofa-bedstead, of the head-rest *r* and *b*, hinges *c c* and *c' c'*, ratchet *g*, and cord *q* with the mattress-frames, whose side-rails are shown at *e* and *e'*, when used in the manner and for the purposes as set forth.

2. The combination of the rail *a*, bar *w* having the slots *s s* and racks *k k*, with the supporters *i i* and mutilated gears *j j*, all as set forth.

135,644.—*Tool for Cutting Pipes.*—CORNELIUS E. HAYNES, Boston, assignor to himself and ISAAC GARDNER, 2d, Hingham, Mass.

Claim.—1. The cylinder B, with its cutters *g* or screw-dies *m*, and ratchet-wheel *n*, in combination with the hand-lever or holder A and pawl *b*, by which it is revolved, operating substantially in the manner and for the purpose described.

2. The cylinder B, constructed with a removable portion, *k*, in combination with the cutters *g* or screw-dies *m*, substantially as and for the purpose set forth.

3. The toothed ring E on the cylinder B, in combination with the gears C and cutters *g* or screw-dies *m*, so arranged that the revolution of the ring upon the cylinder will cause the cutters or dies to advance or recede, substantially as and for the purpose described.

4. The hand-lever or holder A, with its stationary portion *e* and movable portion *d* hinged thereto, in combination with the clamping-ring *c*, substantially as and for the purpose described.

135,645.—*Steam-Radiator.*—ENOCH L. HINCKLEY, Bath, Me.

In the bottom plate are holes directly opposite the mouths of the pipes. Each hole is provided with a screw plug or stopper, and thus the interior of the radiator can be easily reached for repair.

Claim.—The improved heat-radiator, composed of the hollow and partitioned base A, one or more series of tubes, C, and the bottom plate B, provided with the screw-holes *d* and plugs *f*, all arranged and combined substantially as specified.

135,646.—*Process for Converting Cast-Iron Articles into Steel.*—RICHARD A. JACKSON, Pittsburg, assignor to ISAAC CHARLES, Allegheny, Pa., and JAMES J. JOHNSTON, Columbiana, Ohio; said JOHNSTON assignor to WILLIAM D. EISENHART, Allegheny, Pa.

The articles are embedded within a furnace in a composition of charcoal, tan-bark, oxide of iron, and unburned limestone, and subjected to a process of cementation.

Claim.—The union of tan-bark and unburned limestone in compositions of the nature herein described, for the purpose set forth.

135,647.—*Apparatus for the Manufacture of Coal-Gas.*—EDWARD JONES, Boston, Mass.

Each pair of retorts are connected together by a pipe or channel within the furnace in such a manner that the gas or vapor from the most heavily-charged retorts is conducted into the less charged and consequently warmer retort, where it is superheated, and the coal-tar that follows with it from the warmer retort is subjected to additional heat, and the amount of illuminating-gas thereby greatly increased.

Claim.—1. The improved process for manufacturing coal-gas, as herein described, consisting in forcing the gas produced in one retort through one or more retorts without leaving the furnace, in a manner set forth.

2. A connecting-pipe or channel, *c*, or its equivalent, in the furnace between two or more retorts for the purpose of forcing the gas from one retort to another, as herein shown and described.

3. The process, as herein described, of charging a pair of retorts with unequal charges and forcing the gas from the heavier-charged retort into the lighter-charged and warmer retort without leaving the furnace, in a manner set forth.

135,648.—*Tobacco-Press.*—DUANE LA DU, Warner, assignor of one-half his right to JOHN P. HIER, Syracuse, N. Y.

The box on wheels has a shaft secured below, to the extremity of which a ratchet and pawl are attached. The shaft is connected with a bar above the box by a chain, which, as it is wound around the lower shaft, carries the upper bar with it and thereby depresses the follower.

Claim.—A tobacco-press, made in the form and operated substantially as described.

135,649.—*Tar or Petroleum Burner.*—JOHN LAW, London, Canada.

A hollow metallic body has four nozzles, to one of which is attached a pipe having a tube within it and screwed into a diaphragm in the center of the body, forming two chambers, the tar entering the central tube while the steam passes around it, both issuing together from a tapering nozzle onto a spreader, whereby they are distributed.

Claim.—A tar or petroleum burner, consisting of the body C with chambers *c c'*, in combination with tubes A and B, couplings E E', and spreader G, all being constructed and operating as described.

135,650.—*Puddling-Furnace.*—EVAN LLOYD, Pittsburg, Pa.

Beneath the hearth-plate is an air-passage, extending from the ash-pit to and communicating with the stack, whereby the base of the stack is protected and the gases from the hearth consumed.

Claim.—The air-conduit G, arranged beneath the hearth and communicating with the chimney or stack at the base thereof, for the purposes and in the manner substantially as described.

135,651.—*Lunch-Box.*—CHARLES E. LOCKWOOD, Bridgeport, Conn.

Claim.—A lunch or variety box with casing constructed as shown, and arranged with sliding drawers and canteen A B C D, and the grooved flange *b*, the ribbed cover or front E, all arranged as described, and for the purpose specified.

135,652.—*Loom-Shuttle.*—THOMAS MARTIN, Chelsea, Mass.

Claim.—The improved shuttle for weaving narrow fabrics having an open back to receive the quill-hook of the race, a slot through the frame of sufficient length to allow the yarn to extend in a straight line from the extremities of the quill to the delivery-eyelet, and the spring *a* and finger *b*, the whole constructed and arranged together, as specified.

135,653.—*Revolving Paddle.*—JOHN W. MCDERMOTT, New York, N. Y.

A revolving paddle is caused to slide in a slot in the axis of its driving-shaft, during the revolution of said shaft, by means of guides curved eccentrically to the latter, whereby the paddle is caused to strike the water at the proper point of the revolution and to recede into the shaft when not required to act upon the water.

Claim.—1. The bucket or paddle E, freely sliding in a mortise that goes transversely through the shaft D, substantially as herein described.

2. The sliding buckets or paddles E having the end friction-rollers *e e* and freely sliding in transverse mortise in shaft D, in combination with the guide-rods F, substantially as and for the purpose described.

3. The combination of the shaft D having a transverse mortise therein, sliding bucket E, and friction-rollers *e' e''*, substantially as herein described.

135,654.—*Gang-Plow.*—JOHN K. MCLENNAN, Elmira, Ill.

The plow-frame is vertically adjustable with reference to the axle by means of levers pivoted to the axle and having bearings on rods attached to the frame. The forward part of the frame is tilted by means of the foot-board or by a lever.

Claim.—1. The bent slotted levers D D, with their adjusting-detents G G, or equivalents, attached to the axle B, as constructed, in combination with their horizontal bars *k k*, attached to the plow-beams A A, substantially as described.

2. The plow-beams A A, when constructed as described, and carrying the axle-staples *i i*, and pivoted at the front to the heel of the tongue, and connected with the pivoted foot-board E; stirrup I I, connecting the latter to the heel of the tongue; the lever I, and

connecting-bar *r* pivoted to foot-board E, combined and arranged to operate in conjunction with the levers D D and supporting-rods *h h* of the plow-beams, as described.

135,655.—*Table.*—JACOB C. MILLER and EDSON S. ARMSTRONG, Sunbury, Ohio.

In the lower end of the corner-post is inserted a tubular casting having two vertical grooves formed on its inside and opposite each other. A short distance below the upper end of the casting are formed two inclines, each extending from one groove to the other. A stem or tenon is formed on the upper end of the leg, having a pin passing through it and projecting at both sides. The projecting pin passes up the grooves and inclines and wedges tightly on the inside of the casting, thus securing the leg to the post.

Claim.—The table-leg B formed with a shoulder at the top, and the extension D formed upon the leg and provided with the pin *s* and used in connection with the casting C and post A, all constructed and arranged for operation, as and for the purpose specified.

135,656.—*Device for Discharging Bilge-Water.*—JOHN A. MILLER, Paducah, Ky., assignor of one-half his right to HEZEKIAH P. MILLER, same place.

The bilge-water is drawn from a vessel of light draft by the tendency to a void created behind a projecting tube by rapid movement of the boat, and the discharge port and hole in the bottom of the vessel is securely closed against the access of water, mud, or sand by the raising or withdrawal of said tube.

Claim.—The drain-off pump, composed of the fixed cylinder B having inlet-hole *b'*, inner sliding cylinder C with inlet-hole *c*, discharge-hole *c'*, and packing *c''*, when constructed to operate in the manner and for the purpose substantially as described.

135,657.—*Martingale.*—ROBERT R. MILLER, Southington, Conn., assignor to himself and J. B. SAVAGE, same place.

Claim.—As an article of manufacture, a martingale formed from wire spiral springs, constructed substantially as described.

135,658.—*Stump-Extractor.*—CONRAD MÖRCHEN and PETER DOERFER, Eaton, Wis.

Lower the lever to permit securing the hooks under the stump; then take hold of the ends of lever and tilt one end down, and, as the standard near the other end rises put in one of the pins; then tilt the other end down, and as the other standard rises shift the pin down into the hole below, and so on alternately till the stump is raised out of the ground.

Claim.—The frame A with the curved iron-plate attachment D, in combination with the standards D', levers C H, link F, and hooks G, all constructed, arranged, and operated as described.

135,659.—*Straw-Feeding Attachment for Furnaces.*—DAVID MOREY, Watsonville, Cal.

Claim.—1. In combination, with a steam-boiler furnace, the detachable feeding-box B having the revolving partition C and hinged spring section *g*, substantially as and for the purpose set forth.

2. In combination with the feeding-box, the revolving partition C, elliptical cams *e*, and oppositely-acting springs *f f*, or equivalents, substantially as and for the purpose above described.

135,660.—*Sleigh.*—SANDERS MORRILL, Vienna, Me.

Claim.—The elastic steel brace, in combination with and secured to the standards, bar, and runners, substantially as herein described.

135,661.—*Broom-Head.*—DENNIS J. OWEN and JAMES G. BEYDLER, Springville, Pa.

A clamp constructed with a shank, diverging arms, and curved jaws, formed from one piece of metal, by which, with the aid of the spring in the shank and arms, the brush is held and the head covered with India rubber or leather.

Claim.—The self-fastening clamp, consisting of the shank A, diverging spring-arms B B, and curved jaws C C formed in one piece, and pocket D, all constructed and arranged substantially as and for the purpose specified.

135,662.—*Machine for Sewing Books.*—CHARLES H. PALMER, New York, N. Y., assignor to THE PAMPHLET-STITCHING MACHINE COMPANY, same place.

The signature, held between two slotted clamping-plates, is moved by them through shafts, connecting-levers, and the Geneva stop-machine intermittently under the needle of an ordinary sewing-machine, the upper plate, upon the completion of the sewing, being released from cam-pressure and raised by spring, a presser-foot operated by suitable cam holding it in contact with bed of machine during return movement of clamps. Two signatures can be alternately sewed, (upon the forward and backward movements of the clamps,) being separated by guides, one of which has a knife-edge to cut the thread, said clamps being moved longitudinally to place them into the path of the needle.

Claim.—1. In combination with a sewing-machine and suitable devices for holding the books, the slow and intermittently moving wheel E, controlled by the crank *e* and Geneva stop formed by the rotation of the crank and its attachments to the wheel, as herein specified.

2. The two parallel grooves in the periphery of the slow-wheel E, with the switch G, pin F, and connected shaft D^2 and carrier D, arranged for joint operation to move the carrier and the supported books outward and inward at each operation, as specified.

3. In combination with a sewing-machine and a carrier, D, operated as specified, the holding-plate K, raised at intervals and pressed down firmly upon the books during the sewing operation, substantially as herein specified.

4. The presser-foot N, in combination with mechanism, substantially as shown, by which it is pressed downward by a positive motion during the return motion of the carrier D, so as to hold the book between itself and the bed A, and cause it to be clamped by the next action of the clamping-plate K in a new position ready to present the thread to the knife, and by the succeeding movement free it from the machine, as specified.

5. The knife d^3, in combination with clamp D and K, as specified, so as to perform the double functions of a partition-piece to adjust the position of the books on each side, and of a knife to divide the thread which connects them, substantially as herein specified.

6. In combination with a sewing-machine having a holder-plate K, operated as shown, and adapted to hold and present books to the sewing-machine mechanism, as specified, the gage R with its shoulders R^1 R^2 and bend between them, provided with a yielding spring, *r*, to allow a slight backward motion of the carrier and of the books carried thereon, all as herein specified.

135,663.—*Metallic Packing for Piston-Rods, &c.*—FRANK W. PETTEE, Boston, Mass., assignor of one-half his right to WILLIAM P. WELCH and ALBION CHIPMAN, same place.

Segmental rings provided with ears are held together and forced against the rod radially by springs on bolts which pass through the ears, and vertically by springs on a holding device on top and bottom plates.

Claim.—1. The combination of the segments L with the ears *l*, screw N, and spring O, operating substantially as described, and for the purpose set forth.

2. The combination of the segments L with the blocks P, substantially as described, and for the purpose set forth.

3. The combination of the plates H and D with the segment-rings L M and holding device F E E H, substantially as described, and for the purpose set forth.

135,664.—*Rotary Cultivator.*—CHARLES N. POUNDSTONE, Livonia, Ill.

A common standard extends downward from the cultivator-beam. The lower end is provided with a swivel-head, upon which are placed four slotted arms extending horizontally. Adjustable teeth are set in the slots at a greater or less distance from the center of motion. The swivel-head can be turned to the right or left inclination and secured. The teeth can thus be caused to fit an inclined surface.

Claim.—1. The wheel D having arms *e* provided with slots *g*, in combination with teeth *f*, so as to render the latter adjustable, substantially as and for the purpose set forth.

2. The spindle *d* with shoe *a*, provided with pivotal rib *z* and slot *k*, in combination with wheel D, bolt *c*, and stem C, substantially as and for the purpose set forth.

135,665.—*Lamp-Chimney Cleaner.*—HENRY W. PROUTY, Boston, Mass.

A handle constructed with its end or head in three parts, two with tenons fitted to a ring which serves to give form to the rubber band, which is held in position by shoulders resting on the ring, which constitutes the device claimed.

Claim.—The above-described device, consisting of the stock or handle A B C and the rubber cylinder or elastic band D, combined and arranged as shown and described, and so as to operate as and for the purpose set forth.

135,666.—*Apparatus for the Manufacture of Gas from Hydrocarbons.*—JAMES RIGBY, Portsmouth, Ohio.

Paraffine or other hydrocarbon flows into a triangular retort set in the wheeled furnace, which is lined with tiles.

Claim.—1. A retort constructed with equal sides and adapted to present either side to the action of the flames, as described.

2. The retort D having the centrally-located pipe d^1 and openings in each angle from the pipe d^1, as described.

3. The combination of the furnace A, constructed as described, with the changeable retort D, as described.

4. The combination of the opening in the top, the furnace, the damper, and the chimney-base, as described, for the purpose of consuming smoke.

5. The combination of the furnace, made movable by wheels, as described, with the stationary washing-chamber, as and for the purpose set forth.

6. The combination of the retort D with the pipe E having the opening *e*, the pipe and retort being located on the same horizontal plane, as described.

7. The purifier, constructed and arranged as described.

8. The combination of the furnace, the retort, the supply-pipe, the connecting-pipes, the washing-chamber, and the paraffine, as described.

135,667.—*Railroad Track.*—ALEXANDER D. ROCK, Hamilton, New.

The inverted bowl-shaped bearings and jointed ties are combined with diagonal iron braces to form an improved iron bed for railways.

Claim.—The rail and bearing A, in combination with the hinged bar *b* and braces *c c*, substantially as described, and for the purpose set forth.

135,668.—*Composition for Coating Iron and other Metals.*—FREDERICK J. SEIBOLD, Chicago, Ill.

Claim.—A compound formed of asphaltum or pine-tar, sulphur, plumbago, and carbonate of lime, with or without sand, and in about the proportions specified.

135,669.—*Windmill.*—GEORGE SHAVER, Freeport, Ill.

A cranked wind-wheel shaft is arranged eccentric to the vertical axis of the post, and has its bearings on arms which connect with a cap, which rises and descends as the wind-wheel edges more or less to the wind.

Claim.—1. The cranked wind-wheel shaft C, arranged eccentric to the vertical axis of the post A, and having its bearings on arms *b b* of a cap, B, which latter is caused to rise and descend as the wind-wheel edges more or less to the wind, substantially as described.

2. The vibrating arm D, having the rod N connected to it and supported by the vertically-movable cap B, substantially as described.

3. The vane-arm G', radiating from an enlargement, *v*, on a tube, *m*, in combination with the vertically-movable cap B supporting the wind-wheel shaft, substantially as described.

4. The rod *f*, connected to the vane-stock G and to the arm D' of cap B, as described, in combination with the drawing-down connections *g' h*, substantially as set forth.

5. The vertically-sliding (but not rotating) tube *t* and swivel *s*, receiving through them the rod N and applied to the tube *n* and tongued plate *t*, substantially as described.

135,670.—*Reciprocating Steam-Engine.*—WILLIAM SIMPSON and ALFRED GARDNER, Ilford, England.

Piston-valves of different sizes are arranged on each side of the cylinder, the small one being the induction and the large one the eduction. A still smaller equilibrium-valve is connected with the main steam or the condenser and communicates by small pipes above and below with the inlet-valve. Steam being admitted at full pressure to the cylinder is cut off by the small equilibrium-valve, while the exhaust-valve remains open during the entire length of the stroke.

Claim.—The combination, with the cylinder of a steam-engine, of the inlet and outlet valves and the equilibrium-valve, all constructed and arranged substantially as described, for the purpose set forth.

135,671.—*Breech-Loading Fire-Arm.*—CHRISTOPHER M. SPENCER, Hartford, Conn.

Claim.—1. The combination, substantially as shown, of breech-block A, lever-guard B, and firing-pin *p*, whereby the firing-pin is withdrawn and the hammer started in the act of opening the breech, as set forth.

2. The combination, substantially as shown, of the breech-block A, lever-guard B, firing-pin *p*, and cam-surface *g*, whereby the firing-pin is withdrawn and the hammer started and continued to half-cock in the act of opening the breech, as set forth.

135,672.—*Candying-Machine.*—FREDERICK W. CHR. SPIESS, New York, N. Y.

Claim.—The combination of the frame A with two or more dragée or candying machines, together with the shaft C, which latter is provided with the pulley B, worms *w w'*, and clutches *v v'*, substantially as and for the purpose hereinbefore set forth.

135,673.—*Still for Petroleum and other Liquids.*—AUGUSTUS H. TAIT, Jersey City, N. J., and JOSEPH W. AVIS, Matteawan, N. Y.; said TAIT assignor to said AVIS.

Claim.—1. The arrangement in a still of partitions made in sections, the lower sections being made movable by means of hinge joints or slides, or otherwise, substantially as described.

2. The combination of shafts, operated by chains or other means on the outside of the still, with the vapor-valves in the stationary sections of the partitions of a still, substantially as set forth.

3. A tar-condenser communicating directly with the still, in combination with a valve, H, and cleaning-pipe *f*, substantially as described.

4. The arrangement of a check or stop valve inside the still on the mouth of the tar-discharge pipe, leading from the still to the tar-condenser, said valve being operated by a hand-wheel or other means from the outside of the still, substantially as set forth.

5. The arrangement of an index for the purpose of determining the position of the valve leading to the tar-discharge pipe, substantially in the manner shown and described.

6. A circular still divided in compartments by means of radiating partitions provided with apertures situated alternately at the inner and outer ends of said partitions, to cause the liquid to flow through the still in a zigzag course, substantially as set forth.

7. The arrangement of steam-jets, carrying wet or superheated steam and acting on the passages in the partitions of the still, substantially as described.

135,674.—*Furnace for Heating Metallic Bars, Tubes, &c.*—STEPHEN P. M. TASKER, Philadelphia, Pa.

The arch, having downward projections, is sprung over the hearth so as to be supported by the outer walls of the furnace, leaving the hearth unobstructed.

Claim.—The arch C, having one or more downward projections, *a*, which separate the heating-chambers, there being an open space beneath each projection communicating with the chamber to admit of the material of one chamber being removed to the other without removing it from the hearth, substantially as described.

135,675.—*Grain-Cleaning Machine.*—GARDNER E. THEOOP, Syracuse, N. Y.

A perforated case in a brush-machine is held in place over a series of concentric hoops at top and bottom. As the brush wears off hoops are removed, allowing the case to be brought nearer to the brush. Auxiliary fan on cylinder-shaft below and separated from cleaning-chamber, all the blast therefrom being forced up through dust-chamber.

Claim.—1. In combination with the cleaning apparatus, the adjustable case described, consisting of the heads A, case *a*, and rings *b*, together with the clamping devices *c d* or their equivalent, all constructed and for operation substantially as described.

2. The fan-chamber C disconnected from the cleaning-chamber, as herein set forth, and having the openings at *n n*, and the feathered fan-wheel *f*, having its blades constructed as shown, so combined that the entire blast is directed upward through the openings *n n* into the annular chamber and air-flues, all for the purposes described.

135,676.—*Device for Straightening Railroad Rails.*—THOMAS J. TODD, Somerville, N. J.

The two jaws grasping the head of a railroad rail are connected with the horizontal lever or handle by means of toggles, through which they are operated, (opened and closed.) The jaws are kept perpendicular by means of a toggle, which connects them with the handle. The rail to be bent is placed under the lever near the jaws, and by pressing down upon the end of said lever the rail can be straightened at any point desired.

Claim.—The combination of the lever, the toggle-jointed clamping-jaws, and links to connect the jaws with the lever so as to hold the jaws in proper position to be applied to their work, the parts being constructed substantially as described.

135,677.—*Umbrella-Runner.*—SIGOURNEY WALES, New York, N. Y.

The runner is locked by a catch-lever taking into a groove in the stick. Above the runner is a disk having an eccentric slot with an opening at the end, in which a tongue upon the lever works, being held in the opening by a spiral spring bearing upon the disk above. To unlock the runner, the disk is pressed up against the spring, releasing the tongue from the opening; the disk is turned, by which the tongue is carried along the eccentric slot, thereby drawing the lever from the groove and allowing the runner to move on the stick.

Claim.—1. The construction of the runner with A the catch or lever B having the tongue I, and E the revolving disk, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the runner, of E the disk, having a longitudinal and revolving action, with H the spiral spring, substantially as and for the purpose hereinbefore set forth.

3. F, the eccentric slot or groove in E the disk, substantially as and for the purpose hereinbefore set forth.

4. The opening or stop G in the disk E, substantially as and for the purpose hereinbefore set forth.

5. The combination, with the runner, of B the catch or lever, substantially as and for the purpose hereinbefore set forth.

135,678.—*Band-Cutter's Platform for Threshing-Machines.*—JAMES ALOYSIUS WALSH, Mount Hope, Wis.

A band-cutter's platform which can be attached to either side of the feeder's platform of a threshing-machine.

Claim.—An adjustable band-cutter's platform, C, with the pole *a*, the rods or chains *b b*, and the pins *c c*, as herein described, for use in connection with the feeder's platform of a thrashing-machine.

135,679.—*Mop-Head.*—GEORGE WASHINGTON WHEAT, Philippsburg, Pa.

A mop-head has a cross-bar, in the center of which is a tenoned joint, which is held in an extended position, to connect with the teeth of the frame by a spring located in the enlargement of the cross-bar.

Claim.—The combination of the frame A C D, having teeth *a*, and the jointed movable cross-bar G, all constructed and arranged substantially as and for the purposes herein set forth.

135,680.—*Apparatus for Filling Oil-Cans.*—ELI F. WILDER, Lowell, Mass.

Claim.—1. An emptying-pump, C, in combination with the filling-pump B, substantially as and for the purpose herein specified.

2. In combination with the pumps B C, the pinion *e* and racks *b a*, or their equivalent, for causing the movements of the two pump-pistons to alternate with each other, substantially as and for the purpose herein specified.

3. The three-way cock *w*, in combination with the pumps B C and their single nozzle *p*, substantially as and for the purpose herein specified.

135,681.—*Pegging-Machine for Boots and Shoes.*—ERASTUS WOODWARD, Charlestown, Mass., assignor to ASAHEL WHEELER, trustee for THE COMPOSITE CABLE-SCREW-WIRE ASSOCIATION.

Mechanism is provided for perforating the stock, feeding, cutting, and driving the wire all in the same parallel direction without changing the relative positions of the awl, wire, and driver to each other. Mechanism is also provided for riveting the driven nail from below.

Claim.—1. A pegging-machine constructed in the manner described, so as to first punch the hole in the stock, then feed the wire or wire-like material, and then cut it off, and lastly to drive it through a stationary throat-plate or driving-tube, all in the same parallel direction.

2. A pegging-machine in which the peg or pin is cut off from a wire or wire-like material and driven in the same location without changing the relative position of the remaining wire, awl, and driver to each other.

3. A pegging-machine in which the driver is operated above and the riveter below the stock.

4. The work-supporting presser-foot 13, in combination with the mechanism for operating the riveter 18 from below the stock.

5. The arrangement and use of a cam, 38, connecting-rod 40, cam-lever 41, sleeve 42, rod 30, lever 15, connection 17, cylinder 11, and presser-foot 13, or their equivalents, for the purpose of pressing the stock together and holding it till the peg or pin is driven and riveted.

6. The arrangement of the movable sleeve 2, pin 48, lever 47, rock-shaft 46 with its lever, cam 34, connection 33, rod 30, spring 36, treadle-lever 15, connection 17, and the cylinder 11 with the presser-foot 13, or their equivalents, for the partial regulation of the length of the peg, as fully set forth.

7. In combination, the regulating sleeve 2 and its connecting parts the presser-foot 13 and its connecting parts to operate the rod 30, and the rocking-cam 34 with its groove Y, as cut to move the peg-regulating sleeve 2 suddenly upward at the longest peg, and to allow the changing of stock without stopping the machine, for the purpose of preventing the waste of pegs, as fully shown and described.

8. In combination with the rocking awl, feed, and driver bars p, q, and r, and their registering projections p', q'', and r'', the arched frame 63, provided with a tapering groove, q''', as and for the purpose set forth.

9. The feed arrangement for the stock, consisting in the support 50, friction-wheel 53, and strap 59, shield-wheels 60 61, ratchet-wheel 56, and pawl-lever 57, operated in the manner and for the purpose as set forth and described.

10. In combination, the feed-tube u, sleeve t, connection w, knee-lever y, regulating-sleeve or incline 2, the operating-rod g, and the locking lever 3, as and for the purpose shown and described.

11. The mechanism for operating the riveter positively, consisting of the cam 29, lever 28, rod 27, universally-jointed levers 23 and 26, shaft 25, rod 12, arch 20, roller 19, and riveter 18, or their equivalents, as and for the purpose set forth.

12. In combination, the stationary axis i, operating-bar g, movable cylinder A with the awl, feed, and driver bars p, q, and r, and the knife-levers 5 5, arranged and operated in the manner as herein shown and described.

13. A swinging presser-foot or work-supporting point, 13, as constructed to swing in any direction around the upper end as a center for the purpose of pegging a boot or shoe, as herein shown and described.

135,682.—*Portable Cooking Apparatus.*—GEORGE YINGER, Harrisburg, Pa.

Claim.—1. The skirting W, in combination with boiler D and conducting-tubes m n p, when constructed and arranged to operate as and for the purpose herein set forth.

2. The grouped side arrangement of the tubes m n p, in combination with the stew-vessels A B C, as and for the purpose herein set forth.

3. The perforated, adjustable, detachable elbow-joints L L^1 L^2, in combination with the tubes m n p and the vessels A B C, when made to operate substantially as herein set forth.

4. The benches G G', in combination with the tubes m n p, as and for the purpose herein set forth.

135,683.—*Dumping-Platform.*—JESSE ATKINSON, Cameron, Tex.

Its two sections are held horizontally by a single support, the same being removable by means of levers and chains, in connection with a shaft, allowing the load upon the platform to be dumped.

Claim.—The combination of the springs F and their chains, the levers C, springs f, prongs d d', chains e, and shaft D with the hinged doors or sections B B, as and for the purpose specified.

135,684.—*Handle for Files.*—HENRY KNIGHT AUSTIN, Charlestown, Mass., assignor to himself and GEORGE V. MILLETT, same place.

The clamp-bar rests on the surface of the file, but the jaws that grasp the edges do not reach to the opposite surface; thus the clamp may be placed on the file at any point and yet leave the operative surface of the file free of obstruction.

Claim.—The combination, with handle B and post or arm c, of the head A provided with a stationary jaw a, and a sliding jaw, b, operated by screw d, the said jaws being provided with working-faces parallel with each other and adapted to grasp the opposite edges of the file proper, and being of a depth less than the thickness of the file, so that they cannot extend below the working-surface of the latter, as set forth.

135,685.—*Tree-Protector.*—CHARLES AYERS, Farmington Centre, Wis.

Tree-protector constructed of wire-gauze with ribs to support them a little distance from the tree. The protectors are held in position by elastic fastening, which permits of expansion without leaving an opening.

Claim.—A wire gauze wrapper provided with ribs G, as and for the purpose described.

135,686.—*Car-Coupling.*—CASPER S. BIGLER, Harrisburg, Pa.

To couple, the pin is raised and the link is drawn forward in the slot and thrown over the hook of the adjacent car, and is then drawn back so that the pin may be inserted.

Claim.—The combination of the link B and tapering pin C, whether operated by a screw or lever, with the hook A slotted at a', substantially as herein shown and described, and for the purpose set forth.

135,687.—*Reed-Organ.*—RILEY BURDETT, Erie, Pa.

To the ordinary reed-mute or stop-valve is hinged an auxiliary valve, which qualifies the effect of the mute or not, as desired.

Claim.—The veil B, in combination with the reed-mute to allow of a partial or full opening thereof, substantially as described.

135,688.—*Beer-Cooler.*—JOHN CHANDLESS, New York, N. Y.

Claim.—The zigzag funnel-topped pipe a B, provided with the air-escape d, combined with and applied to the refrigerator A, as and for the purpose set forth.

135,689.—*Hub and Axle for Vehicles.*—MARVIN CHAFIN, Erie, Pa.

To the box is affixed a flange, which forms a groove between it and the end of the box and hub; or a heavy band screwed on the end of the hub may be used for the same purpose; or the attachment may be made on the rim of the box without coming up to the full size of the hub.

Claim.—The bisected cylinder D, provided with screw-threads c, shoulder and groove e, and flange f, and used in combination with the flange C on a hub, collar b on an axle, and the nut G, the axle E and box B extending but partially through the hub A, all substantially as and for the purpose specified.

135,690.—*Reversible Magnet.*—JOHN L. CHURCHILL, Nokomis, Ill.

A series of small steel-bar magnets, pivoted at their centers to a suitable iron frame, are so geared together that they may be rotated in fixed relation to each other, and thus by the constant sum of their polarities form a compound magnet with reversible poles.

Claim.—1. The frame A, containing the end poles a a with the extension plates g g, and the arbors b b with the reversible magnets c c, all arranged to operate substantially as herein set forth and specified.

2. The combination of the armature-plates B B with the rotary magnets c c in the frame A, as specified.

135,691.—*Harvester-Rake.*—JAMES COLLINS, Guelph, Canada.

The rake-arm is connected to its supporting-standard by a swivel-joint, laterally adjustable, so that the plane of the rake, on entering the platform, may be parallel with the finger-bar or at an angle therein. The rake is operated by a horizontally-revolving bar provided with a vertical rod, which passes through a slot in the inclined rake-arm so that the revolving rod will vibrate the rake, and an adjustable nut on the rod will lift the rake above the platform at each return stroke.

Claim.—1. The combination of the rake-head, the upwardly-inclined slotted rake-arm, the swivel-joint, the bracket, the continuously-revolving arm, and the vertical rod that passes through the slot in the rake-arm and serves to operate it, substantially as described.

2. The combination of the rake-head, the slotted rake-arm, the bracket, the revolving rod, and the adjustable collar on the rod for regulating the height that the rake-head is lifted above the platform, substantially as described.

3. The combination of the rake-head, the rake-arm, the hinge-plate, the bracket-plate provided with means for adjusting the hinge plate and rake-arm relatively to the finger-beam, and the revolving crank-arm for operating the rake, all these parts being constructed and arranged substantially as described, for the purpose specified.

4. The combination of the bracket, the hinge-plate adjustable on the bracket, the inclined rake-arm pivoted to the hinge-plate, the rake-head, the friction-roller, and the adjustable guide-plate, all these parts being constructed and arranged for joint operation, substantially as described.

135,692.—*Scissors.*—JOHN A. CORREA, Green Bay, Wis.

A circular disk, with its edges increasing gradually in thickness from a certain point, is pivoted upon one of the blades just front of the usual fulcrum-pin of the shears. The fulcrum-pin has a lug cast upon one side, which enters a recess in the blade; thus the fulcrum-pin must turn with the blade as the scissors are opened or shut. The fulcrum-pin has a rectangular recess, in which the edge of the circular disk works as the scissors are opened and shut. The varying thickness of the edge of this disk acts as a cam in the recess of the pivot and binds the edges of the scissors together the more widely they are opened.

Claim.—1. One or more cam-wheels, g, in combination with the pivot-pin of scissors or shears, when the same is made to operate upon the blades, substantially as and for the purposes described.

2. The slot D in the fulcrum-pin of shears or scissors, as and for the purposes described.

3. The lug E on the pin and the recess F in the blade, as and for the purposes described.

135,693.—*Boring-Machine.*—ISAAC CORY, Dalton, Ind.

The frame is made adjustable by set-screws on the standards. The boring-frame is fed by the handle, and the auger is operated by the internal gear and pinion-wheels.

Claim.—A portable tree-tapping machine, consisting of platform A and legs B, adjustable with respect to each other by screws a, the inclined frame C movable therein, and provided with boring mechanism D E f g h, and the lever G, all constructed, arranged, and adapted to be used as set forth.

135,694.—*Machine for Trimming and Burnishing the Soles of Boots and Shoes.*—LOUIS COTÉ, Saint Hyacinthe, Canada.

The gage is arranged to slide upon the burnishing-sleeve, and may be adjusted to accommodate the burnishing-surface to the varying thicknesses of sole-edges.

Claim.—The adjustable gage E, provided with the recesses e or the equivalent thereof, in combination and arranged with the rasping or burnishing sleeve C, the clamping-guide D, arbor A, and clamp-screw, all substantially as specified.

135,695.—*Land-Marker.*—JOHN CUFF, Emery, Ohio.

A pair of carrying-wheels have marking-pieces attached laterally to their peripheries. Between them, swung to the axle-tree, descend two arms joined at the bottom by a lateral piece. At each end of the latter is a small wheel, and pivoted to the middle is a lever ascending through a longitudinal slot, and confined

therein by a shoulder below and a pin above. The seated driver, by pulling this lever, throws the weight of the carriage from off the larger wheels onto the smaller ones.

Claim.—The arms D D, pivoted at one end to the axle B of marking-wheels, and at the other to an axis, E, provided with small wheels F F and lever G, arranged as described.

135,696.—*Flower-Stand.*—ARCHELAUS C. DAKIN, Clinton, Mass.

A foot piece supports a central rod, upon which is placed rotating disks at any desired height. The rod being loose in its socket, all the disks can be rotated at once, or each separately.

Claim.—The socket A and loose-fitting post C, extending to the top of the stand, and combined with the shelves D D, spiders E E, and tubes a a, all constructed and arranged for operation as and for the purpose specified.

135,697.—*Device for Converting Circular into Reciprocating Motion.*—LUTHER DAME, Newburyport, Mass.

Claim.—The conversion of circular into reciprocating motion by means of adjustable eccentric C, connecting bolt-nipple d, core E, longitudinal slot b, and hollow cylinder A, substantially as and for the purpose described.

135,698.—*Safety-Valve.*—HENRY DAVIES, Newport, Ky.

Radial plates with rounded ends fit into a collar on the valve-stem and into a rabbet in an outer ring, and serve to protect the diaphragm, allowing it to move freely. The valve is made in two parts, held together by a spring for adjustability.

Claim.—1. The combination, with diaphragm G, of the radial plates H, constructed as shown and set forth, and arranged with the rear ends loose in the rabbets of ring I, and the front ends in the concavities of collar K, as and for the purpose described.

2. The valve D, made in two parts and held together on stem P by a spring, as and for the purpose described.

135,699.—*Scraping Instrument.*—VAN NESS DAVIS, Stoneham, Mass., assignor to himself and FRANK A. DAVIS, same place.

An implement or scraper for household use, constructed with an increased width of blade from its shank, forming acute angles or corners, for clearing and cleaning sharp corners, often found in cooking utensils, &c.

Claim.—As a new and useful article of manufacture, the scraping implement A, substantially as and for the purposes described.

135,700.—*Bale-Tie.*—PETER K. DEDRICK, Albany, N. Y.

Claim.—1. A bale-tie, consisting of a metal plate having one point of connection common to both ends of the band, and a projection of one or both ends from the point of connection along and over the taut portions of the band, adapted to secure the end of the band to be tied between said projection and the band, substantially as specified.

2. The mode of securing a wire band to the tie by passing the end of the band to be tied through a hole in the tie-plate or around it, and then between a projection of said plate along the band and the said band, substantially in the manner described.

135,701.—*Wheel for Vehicles.*—JEROME F. DOWNING and WELLINGTON DOWNING, Erie, Pa.

The tenons and wedges are glued when inserted into the hub. To prevent the wedges from being forced out of place a metallic band is forced out over the hub close up to the sides of the spokes and covering the ends of the wedges. Several screws are inserted through the band into the hub to prevent it from slipping.

Claim.—1. The spoke-tenon A, shaped as required in dovetailing, and with one of the narrow sides beveled, as at H, in combination with the mortised hub B, having mortises with the narrow sides opposite the ends of the hub converging in the direction of the center of the hub, but slanting or inclined the same way, so as to leave a space between one of the said narrow sides of each mortise and the spoke-tenon opposite to permit of the insertion of the dovetailing-wedge E, all constructed substantially as and for the purpose specified.

2. The wedge E employed for the purpose of completing the dovetailing of the spoke-tenon A with the mortised hub B, in combination with the mortised hub B and metallic bands F, substantially as described and shown.

3. The combination of the spoke-tenon A with the mortised hub B, the dovetailing-wedge E, and metallic bands F, all constructed and secured together substantially in the manner described, and for the purpose set forth.

135,702.—*Lock.*—ELIZABETH DUENZ and JOHN A. DUENZ, of Fayetteville, Ill., administrators of CASPER BODMER, deceased.

A lock provided with a series of wards, tumblers, and levers, to be operated by a double-bitted key. A false bottom is arranged within the lock and provided with a slot and cross-notches to admit pins attached to a sliding bar and one of the tumblers, for the purpose of holding the bolt in the locked position. One of the wards is provided with a projecting arm, which acts upon the pin of the sliding bar to release it from its notch in the false bottom.

Claim.—1. The false bottom G arranged within a lock and provided with the slot x and cross-notches p q z y to admit and lock the pins m and stop o, as set forth.

2. The tumbler F pivoted on the sliding bar J and provided with the stop o, to operate substantially as herein shown and described.

3. The ward N provided with the arm f^5 for the purpose of acting directly against the pin m, and thereby swing the tumbler F and bar J clear of obstructions, as set forth.

4. The tumbler Q pivoted to the pin r and cambed to hook over the pin m, in combination with a sliding bar J pivoted to the bolt, as specified.

5. The tumbler F pivoted on stud m of bar J and having a projection working in notch p of false bottom G, to operate substantially as herein shown and described.

6. The tumbler U and lever V arranged within the same plane, one to be moved and the other to remain undisturbed to enable the opening of the lock, as specified.

7. The vibrating plate W acting at once upon the pin h^3 and against the bolt, as set forth.

135,703.—*Dress-Elevator.*—MORIS FOX, New York, N. Y.

A hoop of the skirt or bustle is raised or lowered by means of levers attached to a pendant. The toothed lever works in a slot in the other lever, and locks it at the required height when lifting or lowering the skirt.

Claim.—1. The combination of the levers B and C with the hoop D of the ladies' dress-support, as and for the purpose set forth.

2. The combination of the inward projection f, slide e, rods g and h with the levers B and C, to operate in the manner described.

135,704.—*Seed-Planter.*—THOMAS C. GARLINGTON, La Fayette, Ala.

A frame on a carrying-wheel and coverers has affixed thereon two erect funnel-shaped hoppers, with auger-formed feeders, operated by belting from the carrying-wheel.

Claim.—The auger-stirrer J, having side fingers d d, spirally bent to correspond to thread of auger, as and for the purpose set forth.

135,705.—*Bridge.*—JAMES GATES, St. Louis, Mo.

Devices to secure better adjustment of tension, diminished weight, increased strength, and advantageous disposition of material.

Claim.—1. The lower chord, consisting of the tension-bars a a, the pins a^3 a^3, the packing-blocks E E E, the bridge-seat D, and the pins a^4 a^5, constructed and arranged substantially as described and shown.

2. The angle-block F, provided with the flanges f f, the flanges f^1 f^1 f^1, and the tubular projections f^2 f^2 f^2, substantially as described and shown.

3. The packing-blocks E, in combination with the pins a^3 a^3, constructed and arranged substantially as described and shown.

4. The joints in the lower chord, formed by the tension-bars a a, the pins a^3, and the packing-blocks E E E, constructed and arranged substantially as described and shown.

5. The bridge-seat D, provided with the shoulder d, the slots d^1 d^2, and the half-block d^3, constructed substantially as described and shown.

6. The upper chord K, consisting of the end angle-block P, the chord-pieces k, the angle-blocks H H, the keys L, and the pins N, constructed and arranged substantially as described and shown.

7. The angle-block H, consisting of the web h, provided with the vertical tubes h^1, the flanges h^2, and the piece h^4, substantially as described and shown.

8. In combination with the elements of the angle-block H, constructed as described, the half-block h^4, arranged as described.

9. In combination with the elements of the angle-block H, constructed as described, the short chord-pieces K K, as described.

10. The lateral braces O and rods I I, in combination with the angle-block H, constructed and arranged substantially as described and shown.

11. In an angle-block for a truss-bridge, the concave upper surfaces f^2 f^2, substantially as described.

135,706.—*Fire-Kindler.*—MONTRAVILLE GENNEY, Middleburg, N. Y.

Claim.—A fire-kindler prepared by immersing solid charcoal in water saturated with one part of chlorate and two parts of nitrate of potash, and then, after drying, in oil saturated with resin, as and for the purpose described.

135,707.—*Turbine Water-Wheel.*—WILLIAM P. HALE, Lockhaven, Pa.

The water comes in on one side of the curb under the wheel and rises up on an inclined scroll within the same, and the under side of the wheel being on an angle, the water is forced outward to the buckets. The scroll runs in the opposite direction to that of the buckets, which causes a direct action and a reaction at the same time, and the water entering on the inside of the wheel under full pressure and discharging on the outside of the wheel without any back pressure gives a greater amount of power than it would otherwise have.

Claim.—The water-wheel provided with the rim A and buckets B B, formed on a circle of one-half the diameter of the wheel, and the conical top plate C, and used in combination with the interior inclined scroll H, all constructed and arranged as and for the purpose herein set forth.

135,708.—*Wash-Boiler Attachment.*—RICHARD B. HART, Salado, Tex.

In an ordinary wash-boiler are placed two inverted shallow funnels provided with perforated vertical rims. On the vertical tubes of the funnels is placed a horizontal pipe provided with branch pipes. The tubes of funnels pass through a perforated flanged false bottom.

Claim.—The combination of the inverted shallow funnels C provided with vertical perforated rims, the tubes D E, the horizontal pipe F, connected with both tubes E and provided with numerous small discharge-pipes G, and the perforated and flanged false bottom H, with each other, substantially as herein shown and described, to adapt them to be used in connection with an ordinary wash-boiler, as and for the purpose set forth.

135,709.—*Hand Corn-Sheller.*—JAMES M. HAWLEY, Alma, Ill.

The ear of corn passes between two yielding toothed jaws fixed between two revolving carriers, which operation removes the corn from the cob.

Claim.—The combination of the disks A B, hand C, bars and hollow journals D E *d d'*, block or blocks F, pivoted arms G H, jaws I J, stop K, and rod and springs L M, with each other, substantially as herein shown and described, and for the purpose set forth.

135,710.—*Paddle Mechanism for Boats.*—CHARLES HOWARD, New York, N. Y.

Claim.—The paddle shank provided with the slot *c* or equivalent guide, by which the paddle is allowed to slide up and down on the pin or wrist of a crank in such a manner as to allow two cranks, *a b*, of different lengths, to be attached to the paddle, substantially as set forth.

135,711.—*Lantern.*—SEYMOUR HUGHES, Jersey City Heights, N. J.

Claim.—The crown or dome E slitted at the lower edge to form the spring-holding jaws *d d*, and made open or provided with a removable cover at its upper end, as shown and described, whereby the globe C may be inserted or removed through said crown, and adjusted and supported therein, as set forth.

135,712.—*Key-Ring.*—WILLIAM T. JENKS, Toledo, Ohio.

Claim.—As a new and improved article of manufacture, the key-ring herein described, formed of the circular piece A cut out or notched at the ends, and the clasp B pivoted thereto at *d*, and adapted to complete the circle when closed, in the manner described.

135,713.—*Window-Shade.*—EDWARD E. JOHNSON, Painesville, Ohio.

The shade or curtain is made of flexible material and provided with weighted sections, and with cords so arranged that the sections may be rolled together with the shade or separately.

Claim.—The flexible window blind or shade B provided with the weighted sections *b'*, and with cords arranged so that the said sections may be rolled together with the blind or shade, or separately, as described.

135,714.—*Car-Coupling.*—PATRICK KENNEDY, Jr., and ALBERT B. DIBB, Watertown, N. Y.

The link is guided by a hook suspended from a lever. The approaching draw-head strikes the bend on the lever and raises it until the hook is struck by the draw-head, when the end of the link is deposited in the mouth of the same.

Claim.—The lever D, pivoted to the draw-head, supported by a suitable projection thereof, and bent or curved upward at its front end, in combination with the hook E and link B, as shown and described, to operate as specified.

135,715.—*Tool-Holder.*—LEVI L. LAMB, Chelsea, Mass.

The lips on the box and cover, when closed, form a dovetail to hold the blade or tool.

Claim.—The box A and laterally-swinging cover B, each provided with a lip, E, so as to form, when closed, the dovetailed socket F, as described, for the purpose set forth.

135,716.—*Safety-Truck for Railroad Cars.*—BENJAMIN P. LAMASON, Milton, Pa.

To the extreme ends of the car-body are secured pivot-plates, which turn in corresponding plates secured to the ends of beams, which are fastened to the center of the trucks. The object of pivoting the trucks to the ends of the car is to lessen the liability of the car to overturn should it become disengaged from the trucks.

Claim.—The trucks pivoted at their extreme ends to the body of the car, as herein shown, by means of the plates *a b*, beams H H', and bolt *c*, all combined and operating substantially as herein described.

135,717.—*Railway Freight-Cars.*—BENJAMIN P. LAMASON, Milton, assignor of one-half his right to W. J. BRUNDRED, Oil City, Pa.

An oval-shaped car having an iron shell and wooden lining, between which is an air-space. The car is provided with inside and outside sliding doors on its sides, port-holes at its ends for the reception of lengthy freight that could not be entered at the sides, and discharge-vent underneath its center. The body is secured to the trucks by straps passing around it and bolting to the truck-frame, the bolsters of the latter being cut away to conform to the shape of the car. A railing is secured to each side of the car-body for the better security of the employés.

Claim.—An oval-shaped freight-car, composed of an iron shell, *c*, and inner wooden lining *a*, with heat-absorbing space *d* between the shell and lining, provided with doors B C, port-holes *f f*, manhole *e*, discharge-vent *g*, with or without wickets A, when constructed and arranged as described, and combined with a truck, in the manner and for the purpose set forth.

135,718.—*Driven Well.*—JAMES LARUE, Gill Hall, Pa.

The upper connecting section of tubing answers the purpose of a pump-barrel, while the lower section is perforated and provided with a concave cutter having a circumferential edge and central axial aperture closed by a screw-plug to prevent the earth from entering the tube while being driven. The plug has a right- and left-hand screw-thread, by which arrangement it may be withdrawn for a drill to enter through the tube to break such rock in advance of the pipe as would be impenetrable by the cutter.

Claim.—1. The concave cutter B with its central and detachable plug E, in combination with the perforated tube A, in the manner shown, for the purposes hereinbefore set forth.

2. The perforated tube A, concave cutter B, and detachable plug E, in combination with the upper tube N, its check-valve P, and sucker K, when the same are arranged substantially in the manner shown and set forth.

135,719.—*Combined Sod-Cutter and Land-Roller.*—CHARLES LEAVITT, Cleveland, Ohio.

A common land-roller is attached to a frame by tongue or shafts, by which it is drawn over the ground. A cutting-blade is attached by a hinged joint that unites the two frames. The roller serves to gage the depth to which the blade penetrates the earth. When the roller only is used the blade-frame is thrown over upon the roller-frame.

Claim.—The cutting device or blade G, having upturned ends G', with sharp cutting-edges, as arranged in combination with the frame C, and roller A, in the manner as and for the purpose set forth.

135,720.—*Apparatus for Loading and Unloading Hay.*—GEORGE W. LONG, Delaware Center, Iowa.

A sling having a loose rope on one side to be wound upon a crank-shaft upon a frame, to which is attached the other side of the sling with a latch, which releases the rope from the crank-shaft when the load is conveyed to the point desired.

Claim.—The combination of the sling A B, ropes C D, rope E, block F, crank-shaft H G, latch I, and trip-rope J with each other, substantially as herein shown and described, and for the purpose set forth.

135,721.—*Drain-Pipe.*—WILLIAM G. MONK, Brooklyn, N. Y.

Sand is heated and sulphur added; then cement is added to this mixture, the whole being thoroughly mixed and molded.

Claim.—The above-described composition drain-pipe, as a new article of manufacture.

135,722.—*Pulley.*—CHARLES C. MOORE, New York, N. Y.

Claim.—As an article of manufacture, a pulley or wheel revolving upon an axis, C, movable in the curved groove in the eye A, as and for the purpose set forth.

135,723.—*Drain.*—GEORGE B. MOORE, Lyons, Iowa.

A perforated cup with solid bottom is placed below the outlet of the sink and surrounded by a larger receptacle, drained of its contents by siphon-tubes communicating therewith, the fluid passing through the side perforations of the sediment-cup into a receptacle placed underneath, and thence through the siphon-tubes into the drain-pipe.

Claim.—The sediment-cup *c* in combination with the ring *b* and outside receptacle *d*, and arched passage to the outlet *e*, substantially as and for the purpose herein set forth.

135,724.—*Bed-Bottom.*—THOMAS L. ODELL and JOSEPH C. HUDSON, Iowa Falls, Iowa.

Elliptic springs clamped together at the ends; a coiled spring in the middle, the ends resting on a bar and held by a pin.

Claim.—The slats *a*, spring *b*, spring-beam *c*, and pins *d*, substantially as set forth.

135,725.—*Bed-Bottom.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

The springs are formed with hooks and eyes on the upper and lower sides, and on the ends of the wire terminating the coils are hooks which hook into the eyes, and the springs are graduated to form a bolster.

Claim.—1. A mattress, the springs of which are formed with hooks and eyes on the last coils thereof, when the ends of the wire forming the coils are secured to or around the eyes, substantially in the manner and for the purposes herein set forth.

2. A mattress constructed of the springs, as described, with a head or bolster elevation formed by graduating the springs at the head.

135,726.—*Cultivator.*—WILLIAM T. PARKER, Verona, Miss.

The frame which carries the cultivators and chopper is suspended from the main frame, so as to have a swinging lateral motion.

Claim.—1. The vibrating side pieces C C, jointed to cross-pieces D H and connected with tongue K, as described, and for the purpose set forth.

2. The combination of a chopper-shaft, F, with bearing-pieces D H, when the rear one of them has a vertical and elongated slot, as and for the purpose described.

135,727.—*Centrifugal Machine for Purifying Sugar.*—HERMANN PRIEW, Magdeburg, Prussia.

Claim.—1. The herein-described arrangement for using dried steam with air in a centrifugal machine, substantially in the manner and for the purpose set forth.

2. The cover D, in combination with the jacket or casing B, tubes C and A, steam-pipe E, and water-escape pipe F, attached to the top of a centrifugal machine, and arranged in the manner substantially as described, and for the purposes set forth.

135,728.—*Self-Closing Hatch.*—CHARLES H. REYNOLDS, Williamsburg, N. Y., assignor to himself and HENRY C. RICHARDSON, same place.

The hatches are held open by pivoted latches, to which a rod is attached, supported at its lower end by a prop on a weighted lever. A cord inclosed in a tube sustains this lever until a fire occurs, when this cord, exposed to the draft in the tube, is burned

allowing the rod D to fall and lift the latches, which in turn permit the hatches to fall by their weight and close the openings.

Claim.—1. The combination of the sliding rod D, pivoted latches E, and stops G with each other and with the arms H attached to the hatches C for holding said hatches open, substantially as herein shown and described.

2. The combination of the tube I having openings formed in it, the rope J, and the weighted and armed lever K L *b'* with the sliding rod D and pivoted latches E, substantially as herein shown and described, and for the purpose set forth.

135,729.—*Harvester.*—ALEXANDER RICKART, Schoharie, N. Y.

The shipping-lever is pivoted to a block hinged on the main axle and held in place by a collar thereon. A cam on the lever, arranged between vertical arms on the main frame, slides the latter on the axle, and thus separates the driving-gear from its pinion. One of the vertical arms is adjustable to compensate for wear.

Claim.—The combination of pin P, collar Q, and double-cammed lever R S, with studs T T and arm U on frame F, as and for the purpose described.

135,730.—*Machine for Stiffening Netting for Bonnet-Frames, &c.*—PETER C. RITCHIE, New York, N. Y.

The material on which the stiffening solution is to be applied is stretched on the frame and held by pins. The applying roller is mounted in journals on the movable trough that holds the stiffening solution, and as the trough is reciprocated the pinions on the axis of the roller engage the teeth of the rack, and the roller is turned to apply the solution to the net.

Claim.—The net-frame A having rack F on the lower side, the cloth-covered roller D provided with the pinions E E on its journals, and the movable trough C having bearings to receive said journals, all arranged and applied together, as and for the purpose described.

135,731.—*Harvester.*—WILLIAM H. SEYMOUR and DAYTON S. MORGAN, Brockport, N. Y.

The reel is hung on a post pivoted at its bottom, and caused to vibrate back and forth over the finger-bar by its connection with the driving mechanism, in unison with the movement of the rake.

Claim.—1. The combination of the rotating gathering-reel and mechanism, substantially such as described, for vibrating it, these members being constructed and operating in combination substantially as hereinbefore set forth, to cause the reel automatically to move forward in advance of the cutters to gather in the standing crop, and then to retract to sweep the cut grain behind the finger-beam.

2. The combination of the rotating reel moving backward and forward over the cutting apparatus and a side delivery-rake moving over the platform in unison with the reel, but in circular curves, substantially as set forth.

3. The combination of the slotted turning-post, the rotating driving-crank, and the rake-arm rocking in, turning with, and sliding through the post, these members being constructed and operating in combination substantially as set forth.

4. The combination of the rake-driving gear on the main axle, the driving-gear which carries the rake-arm, and the interposed idle-wheel mounted in a bearing swinging around the axes of both the gear-wheels above mentioned, substantially as set forth, to allow the machine to be raised or lowered without deranging the gearing.

5. The combination of the main driving-axle, the swing-frame, the main axle, the windlass, cord, and lever, substantially as set forth, to raise or lower the main frame.

135,732.—*Animal-Trap.*—EMILE ACHILLES CORDEIRO DA SILVA, New York, N. Y.

The trap tips the moment the pivot is passed, and is reset by its own gravity.

Claim.—The wire grating B, vertical slide C, bottom D, two-part top E F, bait-chamber I, hook J, and inclines L L, all combined, constructed, and arranged, in connection with box A, as and for the purpose described.

135,733.—*Apparatus for Treating Offal.*—JOHN A. SLATER, New Haven, Conn.

Claim.—1. The combination of the cylinders B provided with removable teeth, the pipes E F and jacketed tank, substantially as set forth.

2. In combination with the cylinders B, the detachable stirrers, as described.

3. The jacketed tank A, revolving cylinders B having detachable teeth, gears *c*, and pipes D, E, and F, when all are combined to operate in the manner and for the purpose set forth.

135,734.—*Belt-Punch.*—ALBERT N. SOUTHWICK, Boston, Mass.

Claim.—The combination of the punch A, slotted sleeve D, awl B, and thumb-screw *c*, constructed and arranged together as specified.

135,735.—*Stove-Grate.*—JOHN R. STONE, Round Grove, Kans.

A device for suspending, raising, and lowering the grate.

Claim.—The bent lever G, pawl I, notched yoke C, and catch plates or buttons F, in combination with the grate A, substantially as shown and described.

135,736.—*Cultivator.*—WILLIAM TAYLOR, Mansfield, Mass.

The expanding wings are connected by means of rods to a block sliding in the beam.

Claim.—The block J, arranged in a longitudinal slot of the beam A, the bars I, connected therewith at the under side and pivoted to the middle portion of the wings H, the lever N, and plate O, all as shown and described.

135,737.—*Fruit-Basket.*—WALTER D. TEMBLER, Dunkirk, N. Y.

The basket is made of paper or thin sheets of wood saturated with paraffine. The upper edges are strengthened by rods and cords, and feet are stamped in the bottom.

Claim.—A fruit-basket, with body A saturated with paraffine, having feet *a* in combination with rods *b* having cords *c*, substantially as and for the purpose specified.

135,738.—*Swing.*—EDWARD A. TUTTLE, Williamsburg, N. Y.

To prevent the too great elevation of a child in swinging, the inventor has contrived, by the aid of horizontal springs and two bars, to keep the seat moving in a horizontal line.

Claim.—The pivoted posts, uprights, or frame C and springs F, or equivalent counter-balance, for supporting the pendent bars or arms D and seat E, substantially as herein shown and described, and for the purpose set forth.

135,739.—*Button for Garments.*—ANNA CATHARINE WILHELM, Philadelphia, Pa.

The shank of the button is shouldered at its lower end, and has a transverse hole near its upper end to receive a small pin which fastens it to the disk. An annular screw-cap secures the pin, and also affords a means of producing a button of different design by the insertion of any desired material over the disks, or by changing the disks themselves.

Claim.—1. The shank A and detachable pin 3, in combination with the disk B, annular screw-cap C, and the changeable fabric D, the said parts being constructed and arranged, in their relation to each other, as and for the purposes hereinbefore set forth and described.

2. The shank A and detachable cap C', in combination with the changeable disk E or either of the beads F G, the said parts being secured together, respectively, substantially as and for the purposes hereinbefore set forth and described.

135,740.—*Millstone-Balance.*—GEORGE W. WILSON, Chebanse, Ill.

Adjustable weights are kept in place between the band and millstone by having their convex sides grooved or ribbed.

Claim.—A balance for burr-millstones, consisting of the riveted band B, and the grooved or ribbed weights C, arranged substantially as herein shown and described.

135,741.—*Harvester.*—THOMAS Y. WOOLFORD, Romney, W. Va.

The main driving-gear wheel is incased in the driving-wheel, and propelled by it by means of a pawl secured to the drive-wheel, and engages with ratchets on the gear-wheel, and, through intermediate gearing, motion is communicated to the cutters.

Claim.—The arrangement of the spring-pawls J, gear-wheel I, pinion-wheel K, shaft L, and gear-wheels N O, with respect to the recessed drive-wheel H, axle C, frame A, and driving-shaft P, substantially as herein shown and described, and for the purpose set forth.

135,742.—*Wagon-Coupling.*—ULYSSES WYNN, Sterling, Ill., assignor of three-fourths his right to WILLIAM L. PATTERSON and JOHN G. MANAHAN, same place.

Claim.—The combination of the socket A, body-loop B, socket C, king-bolt D, and clevis E, in combination with the spring H or other connecting device, all constructed and operating together substantially as described, as and for the purposes specified.

135,743.—*Seed-Dropper.*—FRANK W. YOUNG, Holden, Mo.

A flat circular box has at its central portion a concentric recess, between which and the periphery is a series of recesses, which form seed-cups with adjustable capacity. The disk is rotated by means of a reciprocating bar, the bifurcated ends engaging with teeth on the disk.

Claim.—The pivoted arms D and pivoted disk E, in combination with the pivoted wheel C provided with dropping-holes *c'*, substantially as herein shown and described, and for the purpose set forth.

135,744.—*Tug-Buckle for Harness.*—CHARLES W. ADAMS, Wheeling, W. Va.

The buckle consists of a rigid tongue, which projects from the outer side of the tug; a metallic box-slide or keeper, which is notched to embrace the tongue; and a metallic strap, which is riveted at both ends to the tug and forms a way for the slide. The metallic strap, by friction, prevents the displacement of the trace when the slide is properly adjusted.

Claim.—The combination of the metallic tug A, supporting a rigid tongue or spike, *c*, and the box-slide or keeper C applied to the face of said tug, and attached, guided, and held by a spring or metallic strap, *d*, as herein shown and described, for the purpose specified.

135,745.—*Heel-Trimming Machine.*—CHARLES J. ADDY, Boston, Mass., assignor of one-half his right to JOHN R. FOLSOM, same place.

The shaft of the revolving cutter-head has bearings in a sliding frame, which is provided with a pin resting, when the machine is in action, upon a movable guide. The upper side of this guide conforms in shape to the finished heel, while its opposite side has a rack which meshes into a pinion upon the periphery of the heel-plate. The cutting action of the wheel H is limited and regulated by the moving guide.

Claim.—1. The combination of the cutter H, the arm G' G², and the sliding frame K, substantially as described, and for the purpose set forth.

2. In a heel-trimming machine, the sliding guide *l D F*, operating, in combination with the cutter H, substantially as described, and for the purpose set forth.

135,746.—*Grain-Separator.*—WILLIAM B. ALLEN, Winona, Minn.

Flexible sieve having different-sized apertures, so as to deliver oats, cockle, &c., at different places, surrounded by a roller covered with yielding material. Grain fed in between roller and sieve.

Claim.—The combination of the cylinder A having at one of its ends the zigzag cam F and its outer surface covered with one or more thicknesses of soft cloth or leather, or their equivalent, and the flexible sieve B B, with its elastic straps or springs *a a*, substantially as and for the purpose hereinbefore set forth.

135,747.—*Railway-Track Lifter.*—AUGUSTUS H. ARNOT, Morristown, assignor of one-half his right to THOMAS J. SPECK, Rogersville, Tenn.

The beveled or front end of the foot and nose of the lever are inserted between the ties and under the rail. The power end of the lever is then depressed, the pawl following over the ratchet-teeth and locking the lever at the successive points or various angles.

Claim.—The foot-piece, beveled at its forward end and formed of the two like parts 2 2, the lever 1 (A B) pivoted between them at F, the block 6, and the standard formed of the parts 4 4, applied to the rear end of the foot-piece, as described, and the pawl 3, all constructed and arranged to operate as set forth.

135,748.—*Shuttle-Box Mechanism for Looms.*—WILLIAM ATKINSON and CHRISTIAN C. KLEIS, Philadelphia, Pa., assignors to THOMAS WOOD, same place.

The horizontal lifting-lever is actuated by a cam having inclines, each arranged as to length and pitch to move the boxes one step up or down. The reciprocations of this cam to the right or left, as required, are effected by means of a disk on the same shaft, having on its face two series of steps, so placed as to be acted upon by a swiveled double-pawl on a reciprocating sliding arm. The extent and direction of movement of the disk depend upon the position of the arms of the double pawl, which position is controlled by a pattern-chain having studs of different length. The cam having inclines is held against the disk by a spring-clutch to prevent breakage of the parts in case the boxes are obstructed.

Claim.—1. The cylinder *i* with steps projecting from its face, and the cam *k* provided with inclines, in combination with the swiveling double pawl *h*, carried by the reciprocating-bar *f* and with the lifting-lever *a*, all constructed and operating substantially as described.

2. The cylinder *i*, having steps on its face, and the cam *k* having inclines, in combination with the clutch 5, spring 6, and collar 7 upon the stud *g*, as and for the purpose set forth.

135,749.—*Lamp.*—LEWIS J. ATWOOD, Waterbury, Conn., assignor to THE PLUME AND ATWOOD MANUFACTURING COMPANY, same place.

The chimney-supporter is formed of bent wires passing under the cone and through the ratchet-case, thence upward, giving a support to the air-distributer, which is situated near the upper end of the wick-tube. The cap is detachable.

Claim.—The air-distributer near the upper end of the wick-tube, and the deflector resting upon the same, in combination with the cone *h*, chimney-supporting flange *k*, and spring chimney-clamps *s*, substantially as and for the purposes set forth.

135,750.—*Machine for Stamping Sheet-Metal Ware.*—THEODORE P. AUSTIN, New York, N. Y.

A hydraulic press adapted for stamping sheet-metal ware is operated by both a high and low pressure fluid, the high-pressure fluid being used to give the final depression to the "holding-down" block and the "stamping"-block; also to start the blocks back in case of binding.

Claim.—The combination of the high and low pressure fluid-reservoirs M M, and valves L l′ with the cylinders D E, the pistons F H, the holding-down block or ring G, the stamp I, and treadles K K′, when said valves are constructed and connected with both reservoirs for successive supply of the fluid at different pressures during the motion of the pistons, substantially as specified.

135,751.—*Paper-Ruling Machine.*—ELLICOTT DAVID AVERELL, New York, N. Y.

The paper is carried forward by the feed-apron until arrested by the stop-gate, which is raised to release it at the proper time by a cam on one end of the ruling-cylinder, which carries on its opposite end adjustable cam-plates operating a circuit-closing arm. As this arm is thus vibrated its conducting body is brought into contact with the finger connected with the battery to complete the circuit through the magnet, which attracts the armature and depresses the pen-beam attached to it, thus keeping the pens upon the paper until raised by the breaking of the circuit, as the insulated point of the circuit-arm is vibrated into contact with the conducting-finger. A second pen-beam, divided transversely, is arranged to rule faint or continuous lines.

Claim.—1. The combination, with an electro-magnet or magnets, O, armature N, and striking pen-beam K, actuated by the magnet, of the revolving cam S carrying adjustable sections *m n*, which operate the circuit breaker and closer R, substantially as and for the purpose herein set forth.

2. The pen-beam L, divided transversely at or near the middle of its length to form independent sections for separate or joint action, substantially as specified.

3. The transversely-divided or sectionally-constructed pen-beam L, in combination with the striking pen-beam K, essentially as described.

135,752.—*Machine for Setting Saws.*—JOHN G. BAKER, Philadelphia, Pa., assignor to ENTERPRISE MANUFACTURING COMPANY OF PENNSYLVANIA.

Near one end of the frame is attached an arm, acted on by a coiled spring, and carrying at its outer extremity an adjustable disk having a periphery of varying width that strikes on a cylindrical and reversible anvil-block, the edges of which are beveled eccentrically. An adjustable pointer determines the position of the saw-teeth on the anvil, and a set-screw, striking against projections near the pivoted end of the striker, limits the force of the blow.

Claim.—1. The combination of the said spring-arm with a striker, consisting of an adjustable disk having a periphery of varying width.

2. The combination of the said spring-arm and its set-screw *j* with two or more stops on the frame.

3. The combination of the said spring-arm with a rubber block or equivalent spring, *p*, on the frame, for the purpose specified.

4. The combination of the arm and its striking-disk, having a periphery of varying width, with the adjustable anvil F, having an eccentrically-beveled edge.

5. The cylindrical reversible anvil, having its opposite edges eccentrically beveled, as set forth.

6. The combination, substantially as described, of the adjustable pointed gage G with the striker and anvil and the shoulders or stops *s s* of the frame.

135,753.—*Mop-Head.*—JOSEPH W. BARBOUR, Winooski Falls, Vt., assignor of one-half his right to GEORGE D. NASH; said NASH assignor to THOMAS COLLAMER, same place.

A spring-clamp is pivoted on the inside of the mop-frame, and is provided at its lower end with a roller that presses against the lower part of the mop-frame and holds the mop-cloth between the clamp and frame.

Claim.—The spring-clamp C, pivoted to the mop-frame A, and provided with the round or roller F, in combination with the concave bar B, substantially as specified.

135,754.—*Drawer-Pull.*—CHARLES S. BARNARD and EDWARD A. BARNARD, West Meriden, Conn.

The pendent drawer-pull is made a part of the ordinary escutcheon-plate. Thus several screws and a large amount of labor and space upon drawer are saved.

Claim.—As an article of manufacture, the combined escutcheon and drop-pull, substantially as specified.

135,755.—*Saddle-Tree.*—PHILIP BECKER, Philadelphia, Pa.

The saddle is constructed almost entirely of leather and strengthened with steel springs.

Claim.—1. The saddle-tree constructed of leather, in connection with the springs K and stiffening end braces or bands, substantially as set forth.

2. The saddle-tree having its seat E constructed of overlapping pieces L L, substantially as and for the purpose set forth.

135,756.—*Feed-Water Heater and Condenser.*—ROBERT BERRYMAN, Hartford, Conn.

The steam is conducted from the heater to the condenser, and the water from the latter is carried back to the heater. The head of the heater, having suitable flanges, is connected to cast-metal U-shaped pipes, in preference to the tubes made of malleable or composition metal.

Claim.—1. The combination, with a condenser, A, and feed-water heater B, of pipes or passages *b c d*, whereby the steam is conducted from the heater to the condenser, and the water from the latter is carried back to the heater, as specified.

2. The combination, with the head C of the heater, of U-shaped pipes, made in whole or in part of cast metal, and secured substantially as specified.

135,757.—*Feed-Water Apparatus for Steam-Boilers.*—ROBERT BERRYMAN, Hartford, Conn.

A case provided with a diaphragm is connected by levers to the throttle-valve in the steam-pipe, and is combined with a pump and a series of boilers, so that the pressure of water in the feed-pipe is made the means of regulating the throttle and thereby automatically regulating the flow of water. To prevent any sudden descent of the diaphragm when it is elevated by the rising water, a check-valve having a slight lead or small hole through it (to allow the water to escape slowly) is arranged in the pipe leading to said diaphragm.

Claim.—1. The regulating apparatus, consisting of a case, A, diaphragm, chambers, and levers, or its equivalent, in combination with a pump and with a series of boilers, all arranged substantially as described, so that the pressure of water in the pipe leading from the pump to the boilers is made the means of regulating the throttle, and of automatically retarding, stopping, and starting the pump, for the purpose set forth.

2. The combination, with the pipe leading to the chamber *c*, of a valve, *i*, having a "lead" or opening, and operating as set forth.

135,758.—*Steam-Radiator.*—ROBERT BERRYMAN, Hartford, Conn.

Bent pipes, formed partly of cast and partly of malleable metal, communicate with independent chambers.

Claim.—The combination, with independent chambers, of one or more series of tubes, each communicating with both chambers, and each consisting of a section of cast metal and sections of thin malleable metal, as set forth.

135,759.—*Fire-Plate for Steam-Boilers.*—ETIENNE BOILEAU, St. Louis, Mo., assignor to BOILEAU PATENT STOVE AND FURNACE FIRE-PLATE COMPANY, same place.

Claim.—1. In combination with the slotted fire-plate A B, the overhanging top C, substantially as set forth.

2. The bracing-legs G, employed in connection with the fire-plate, in the manner and for the purpose set forth.

3. The apron L, substantially as and for the purpose set forth.

135,760.—*Blank-Book.*—JOHN C. BONNELL, Burlington, Iowa.

Spaces are left on full folio for entering the office, the name of the buyer, the form of coupon, through rate, number of coupon, class, and aggregate amount. The other folios are curtailed of the paper occupied by these spaces, the latter forming an index for the rest of the book, which is occupied by the names of the companies and rate and amount columns.

Claim.—As an article of manufacture, a blank-book provided with one full folio, while the remainder are cut out and the vacant space filled, in substantially the manner as and for the purpose set forth.

135,761.—*Churn.*—JOB BORTON and WILLIAM H. HARTLEY, Quaker City, Ohio.

The dasher is adjustably attached to the rod by set-screws. The rod is rigidly united to the rocking-shaft, as is also an exterior rod, which carries a weight, forming a pendulum.

Claim.—The dasher-staff B, slotted as described, in combination with the adjustable dasher C and the weighted rod *a*, as and for the purpose set forth.

135,762.—*Railroad Truck.*—JAMES W. BOWER, Greencastle, Ind.

Claim.—The railroad truck herein described, having the horizontal braced beams A B², holding at each end a journal-box, and provided at the middle with a square opening, F, to receive the transverse beams G and I, substantially as specified.

135,763.—*Machine for Setting Button and Lacing Hooks.*—HORACE C. BRADFORD, Providence, R. I.

The button-hooks are selected from a hopper and conducted to a clinching apparatus singly, and the prongs, after being inserted, are successively bent over and clinched.

Claim.—1. The finger-wheel, arranged to be intermittently rotated, in combination with the inclined chute, substantially as described, whereby the line of hooks in the chute may be held in place, and the lowest in line released and started downward, as and for the purposes specified.

2. The combination, with the transfer-bar and the nippers, of the finger *k*, arranged to retire on the descent of the nippers, substantially as described.

3. The turning-fingers, arranged to operate successively upon the prongs of the hook, in combination with the clincher, substantially as and for the purposes specified.

135,764.—*Child's Carriage.*—RODNEY G. BRITTON, Springfield, Vt.

Claim.—1. The front axle of a child's carriage, provided with lateral arms *d d*, and connected, by a swivel-joint, *a*, with the supporting-arms *b b* of the sills D D, substantially as described, for the purpose specified.

2. The segmental guide-bar *c*, provided with the L-shaped bracket, and arranged between the sills D D of a child's carriage, in combination with the front axle swiveled upon the pivot *a*, substantially as set forth.

3. The handle F of a child's carriage, connected with the same by a hinge-joint, in combination with the slotted brackets *g g* and set-screws *i i*.

4. The lips *k*, projecting from the ferrules or caps of the side bars of the handle, in combination with notches *l* in the brackets *g*, and with the set-screws *i*, substantially as set forth.

5. The sectional standards *m*, connected to each other by hinge-joints *n*, in combination with the top G of a children's carriage, substantially as and for the purpose herein shown and described.

135,765.—*Steam Water-Elevator.*—ALVAN D. BROCK, Washington, D. C.

Water is admitted from an elevated reservoir into a boiler arranged in a furnace. As soon as enough steam is generated it forces the water contained in the boiler out through a pipe having its exit near the lower end of the boiler. A check-valve in the pipe, connecting the reservoir and boiler, is opened when the boiler is empty and closed by the steam until this has escaped with water through the outlet-pipe.

Claim.—The combination, with a reservoir, C, and boiler B, of a supply-pipe, D, having an automatic check-valve, *d*, and a discharge-pipe, E, having its exit from the boiler below the water-line, all arranged substantially as and for the purpose specified.

135,766.—*Cotton-Planter.*—JAMES M. BROOKS, Woodbury, Ga.

A seed-box, supported upon a single wheel, is attached, by means of two pairs of link-hinges, to the back of the plow-standard, one pair at the top and the other at the bottom, so that the seed-box has a free vertical movement in parallel lines with the back of the standard. The seeding device within the seed-box is worked by means of the bearing-wheel.

Claim.—The combination of the standard B and the seed-box D, hinged thereto at its top and bottom by the staples *a a*, so that the box will move up and down on the standard in parallel lines thereto, substantially as set forth.

135,767.—*Machine for Turning Sewing-Machine-Needle Blanks.*—JOHN BROOKS, North Bridgewater, Mass., assignor to himself and CHARLES HOWARD & CO., same place.

This is an automatically-working machine throughout. It grasps the wire fed to it and carries it forward intermittingly to a reducing device or turning-tool, which is made to pass along it as it is rotated and fashion it to the contour of a finished needle. On a single length of wire several of these blanks are made in succession, and left connected as the wire comes from the machine. The wires are fed to the machine through the tubular shaft by hand.

Claim.—The combination and arrangement of the mechanism, operating substantially as described, to successively and automatically reduce the wire to form the needle-blanks.

135,768.—*Manufacture of Steel.*—THOMAS BROOKS, Canton, Ohio.

Tungsten, fourteen ounces; spiegeleisen, fourteen ounces; charcoal, eight ounces; manganese, half an ounce; Swedish bar iron, seventy-four pounds. Place in a smelting-furnace and treat in the usual way for production of steel.

Claim.—The herein-described compound of tungsten, manganese, and charcoal, when used substantially in the proportions and manner set forth, for the conversion of wrought or bar iron into steel.

135,769.—*Machine for Gumming Saws.*—CHARLES N. BROWN, Providence, R. I.

Artificial heat from 150° to 350° Fahrenheit, according to the degree of hardness of the saw, is applied at the part where the teeth are to be cut or gummed to render the saw elastic under such operation, and thus obviate the danger of the saw becoming broken at such time.

Claim.—1. The employment of artificial heat to render saw-plates and saws elastic before being cut or gummed, in the manner and for the purposes herein set forth.

2. The combination of a lamp or other heating device with a saw and punch or gumming-machine, for the purpose set forth.

3. The application of a thermometer to a saw-plate at the time of heating, substantially as described, and for the purposes set forth.

135,770.—*Automatic Toy.*—ARTHUR W. BROWNE, Bloomfield, N. J., assignor to ALTHOF, BERGMAN & CO., New York, N. Y.

The figures seem to rock themselves, the source of motion being concealed in the seat of the swing.

Claim.—A train of clock-work and revolving crank, swinging with the seat or platform to which they are attached, in combination with the suspending-rods and a connecting-link from the crank to one of said rods, substantially as and for the purposes set forth.

135,771.—*Carriage-Painter's Stand.*—JOEL BURTCH, Hall's Corners, N. Y.

The article to be painted can be raised or lowered, turned around, or tilted.

Claim.—1. The tilting piece G, combined with the universal joint D, for the purpose specified.

2. The revolving and adjustable standard C, for the purpose specified.

3. The general construction of the stand, for the purpose specified.

135,772.—*Apparatus for Extinguishing Fires.*—OSCAR F. BURTON, New York, N. Y.

Bridges are connected to buildings on opposite sides of the street, and water-pipes extending up from the main pipes in the street are provided with nozzles above and below, and with jackets to prevent the water in the pipes from freezing, and which also assist in supporting the bridge, the lower nozzles being so situated that they can be connected to a fire-engine, while the bridges give convenient access to the upper nozzle that a hose can be connected to them and that currents of water can be thrown on any portion of the adjacent buildings.

Claim.—1. The combination of bridges B B, connecting the roofs of buildings, with water-pipes C C extending up from the street, and provided with upper nozzles *a a* and with lower nozzles *b b*, substantially in the manner and for the purpose herein shown and described.

2. In combination with the bridges B B and water-pipes C C, the jackets D D, inclosing the water-pipes and serving as additional supports for the bridges, substantially as set forth.

135,773.—*Pipe-Wrench.*—WILLIAM H. BURTON, Selma, Ala.

A bifurcated or forked wrench with one jaw, made adjustable by means of the same being hinged and operated by a set-screw.

Claim.—The adjustable serrated or movable jaw-fork pipe-wrench, when the said jaw is held firmly by a set-screw or an equivalent device, for adjusting the opening or space E, between the jaws A and B, to receive and turn the pipe, substantially in the manner as herein shown and described.

135,774.—*Bed-Bottom.*—EZRA G. CAMERON, Ashtabula, Ohio, assignor of one-half his right to L. M. CROSBY, same place.

Each spring supports two slats, and the terminal coil of the spring is interwoven with the webbing.

Claim.—The combination of the slats D, springs B, and webbing C, two slats being supported upon each spring and the upper ends of the springs interwoven with or passing through and through the webbing, as and for the purpose specified.

135,775.—*Car-Coupling.*—WILLIAM J. CHAPLIN, Kalamazoo, Mich.

Claim.—The shoulders *s s* on each side of a vertical recess of a draw-bar for receiving the leg *d*, in combination with the bifurcated coupling-pin, substantially as described.

135,776.—*Pivot-Bridge.*—THOMAS C. CLARKE, Philadelphia, ADOLPHUS BOSMANO, and JOHN GRIFFEN, Phœnixville, assignors to CLARKE, REEVES & Co., Philadelphia, Pa.

The links are depressed by suitable mechanism when the bridge comes to its closed position, and encounter the plates G with their raised stops h, by which centering and arrest of vibration are speedily accomplished, and a firm bearing at multiple points secured during the transit of trains, which relieves the central pivot. The peculiar form here claimed is adapted to the repair of old bridges, another style being already patented for new ones.

Claim.—The combination of the links b, connected to a pivot-bridge and to any suitable operating mechanism, with the foundation-plate G and their stops h.

135,777.—*Lubricator.*—BENJAMIN F. CLEMINSHAW, Troy, N. Y.

Claim.—The wrench H, constructed as described, and passing through the stuffing-box G and head E, for operating both said head and the valve D, substantially as herein set forth.

135,778.—*Lamp-Shade Holder.*—ERNST E. CONRAD, Philadelphia, Pa., assignor of one-half his right to MATTHIAS MEIR, same place.

To remove the band it is only necessary to lift one section from the other, whereby the angles clear the ways, and the sections are immediately disengaged.

Claim.—1. The sections A′ and A″, with their locking-joints constructed of the angles d and ways e, adapted to be connected and disengaged, substantially in the manner set forth.

2. The combination, with the sections A′ and A″ and their joints d e, of the screw C, applied and operating substantially as described.

135,779.—*Wagon-Body.*—NELSON B. COOPER, Liberty, Ind.

The end posts are made of iron and have grooves for the reception of the sills, cross-bars, side boards, and end gates of the wagon-body.

Claim.—The rear posts having the braces E in the same piece, and being provided with grooves or notches for embracing the sills B, the cross-bar C, the side boards F, and the end gates G, and also with a ring or loop, D, for the stakes, substantially as set forth.

135,780.—*Boster-Press.*—JOEL COBY, Chicago, Ill.

Claim.—1. The combination of the levers B B, wheels a a, track C, pulleys b b, and rope S attached to one of the pulleys b, substantially as and for the purpose specified.

2. The frame D E, in combination with the platen J, levers B B, substantially as and for the purpose specified.

3. The wheel K, when provided with a flange, y, both upon its upper and lower side, the flanges being recessed, and one flange being provided with a removable piece, g, substantially as and for the purposes specified.

4. The wheel K, when provided with recessed flanges y and spring r, substantially as and for the purposes specified.

5. The combination of the wheel K, having recessed flanges y, with the spring-bolt h, pin i, and plate l, substantially as and for the purposes specified.

6. The combination of the wheel K, spring-bolt h, and stop or catch k, substantially as and for the purpose specified.

7. The combination of the drum M, lever N, brake-bars P P′, constructed and operating substantially as and for the purpose specified.

135,781.—*Meat-Crusher.*—ANDREW J. CRANE, Waterbury, Vt.

Two rolls or cylinders cast with teeth so arranged that the inner face of the teeth is brought in contact or opposite the opening of the teeth in one above it, by which, as a crusher, it is rendered more effective.

Claim.—The combination of two or more cylinders, each having concave-sided ribs broken into teeth, the spaces between the ribs running the whole length of the cylinder, the cylinders being so collocated that, in revolving, the ribs of each cylinder enter the spaces between the ribs of the other, and the teeth of each cylinder come opposite the intervals between the teeth of the other, all the parts being constructed and arranged to operate as specified.

135,782.—*Case for Exhibiting Spools.*—JOHN D. CUTTER, Brooklyn, N. Y.

The exhibitor is provided with curved rails or tracks for the heads of the spools to run upon, said rails terminating in front of the case, both above and below. Near the lower ends of the tracks pockets or breaks are made for the lowest spool to drop into, and operate as a stop to the spools above it on the same track.

Claim.—1. The case A of a spool-exhibiter constructed or provided with rails or tracks for the heads of the spools to run upon, substantially as and for the purposes herein set forth.

2. The semicircular rails or tracks C C arranged to terminate in front of the case A, both above and below, essentially as and for the purposes described.

3. The pockets or breaks g in the spool ways or tracks C C at the forward lower ends of the latter, substantially as specified.

135,783.—*Signal-Lantern.*—THOMAS A. DAVIES, New York, N. Y.

The colored glass is moved up and down by rods passing through tubular passages in the oil-cup.

Claim.—1. In combination with the oil-cup provided with the tubes C C and with the annular plate D for supporting the colored cylinder J, the rods F and H, jointed so as to fold, as specified.

2. The lantern oil-cup or lamp provided with the tubes C running vertically through it for receiving the elevating-rods F, as specified.

135,784.—*Life-Raft.*—WILLIAM B. DAVIES, New York, N. Y.

An annular cylinder, braided of rattan or basket-work, contains within it another cylinder, also of the same material, whose exterior is covered by some water-proof elastic material, the outer cylinder acting as a protection to the inner one.

Claim.—1. A life-raft, the boyant float of which is made of an interior frame of basket-work covered with flexible water-proof material, substantially as described.

2. In combination with such buoyant float a protecting-guard of basket-work, adapted to receive a bottom, C, substantially as and for the purpose specified.

135,785.—*Derrick.*—FRANK DONALD and GEORGE S. NEWTON, Waupun, Wis.

The beam rests upon the standard in a swivel, and consists of three parts, two of which are held in clamps and can be extended to the desired length, and the other is jointed to one end of the lower beam. The jointed part of the beam is operated by a double block and rope.

Claim.—1. The combination of standard A, beams B and C, clasp D, piece E, clasp F, chain K, hook L, poles R, and ropes S, substantially as described.

2. Double blocks I, rope P, and stakes O, in combination with rope H, substantially as described.

3. Hooks L, chain K, and rope S, all in combination, substantially as described.

4. Beam B, yoke Q, in combination with standard A, substantially as described.

135,786.—*Machine for Burnishing Heels.*—EBEN H. DOWNING and WILLIAM JOINT, Lynn, Mass.

The jack is supported upon a yielding standard, the upward movement of which is controlled by a screw and nut.

Claim.—1. In a machine for burnishing the heels of boots and shoes, the combination and arrangement, as herein set forth, of a burnishing-tool, B, provided with a spring, E, to press said tool onto the heel, and a jack for holding the shoe so mounted upon a spring, e, that it will yield to the increased pressure of the spring E when the burnishing-tool is passing over the higher parts of the heel, and rise again when the tool is passing over the sides of the heel, substantially as described.

2. The combination of the rocking block J with the rod F² of a jack passing freely through said block, and the spring e for controlling the position of the jack, substantially as described.

3. The combination of the rod F², the block J, the spring e, and the adjustable nut d, all arranged and operating substantially as described, for the purpose specified.

135,787.—*Sewing-Machine for Boots and Shoes.*—WILLIAM DUCHEMIN, Boston, Mass., assignor to GEORGE B. BIGELOW, trustee, same place.

The needle, which is eye-pointed, carries its thread from the bottom of the channel in the sole outward. Its loop is entered by the thread-carrier. The pick-up passes its point between the carrier and its thread, picks the thread up, and holds it until grasped by the fingers, which hold such loop while the carrier retracts, and until it again passes forward and through its own loop. The shoe is sewn as a turn, and is supported on an arm that enters the shoe.

Claim.—1. The needle and thread-carrier, combined and operating as described, so that the needle a^6 has a positive movement forward, as explained, after the thread-carrier has been withdrawn, in order to tighten the previous stitch.

2. The combination, with the thread-carrier b^4, of the picker-up c^3, and fingers n, these parts being constructed and operating substantially as described.

3. In combination with the thread-carrier b^4 and fingers n, the loop-gage n^7, for determining the length of the loop formed by said thread-carrier and fingers, substantially as described.

4. The take-up lever p, operated by the cam-rod a^1, slotted standard p^2, and spring p^7, for imparting tension to the needle-thread at each end of the stroke of the needle, substantially as described.

5. The adjustable stop p^6, in combination with the take-up lever p, and the tension-roll for regulating the tension of the needle thread during the forward stroke of the needle, substantially as described.

6. The combination of the slotted standard p^2, the bar p, and rollers p^1 p^2 p^3, substantially as described.

7. The combination of the sewing-gage K, presser-spring k^4, presser-arm k^3, and arm g^9 having its upper surface curved, substantially as set forth.

8. In combination with a needle or a thread-carrier moving in an arc of a circle, a stationary guide or support for the thread, arranged substantially in the described relation to the needle or thread-carrier, to prevent the thread from being deflected when the stitch is being drawn up, as set forth.

9. In combination with the thread-carrier b^4 and picker-up c, the standard s, for supporting the thread-carrier and maintaining the loop formed by it in proper position to be taken by the finger n, substantially as described.

10. The block n^5, in combination with the finger n and finger-carriage n^1, substantially as and for the purpose set forth.

11. In combination with standard g^1, the set-screw g^7, for adjusting the position of the top of the arm g^6 relative to the sewing-gage K and presser-spring k^4, substantially as described.

135,788.—*Apparatus for Treating Saccharine Liquids.*—CHARLES W. DURANT, New York, N. Y.

Claim.—1. The receiver I, provided with a vessel or "try-chamber," K, to receive a saccharometer for testing the contents or gravity of the liquid of the receiver, and for the purpose herein specified.

2. In combination with the receiver having a testing-chamber and connecting with the tail-pipes of the heating-coils of a vacuum-pan, essentially as described, the pipes M J N L, operating in respect to each other and to a steam-boiler, substantially as set forth, for the purpose specified.

135,789.—*Rotary Steam-Engine.*—JOHN F. EARLY, Ruckersville, Va.

The revolving wheel is provided with depressed cut-off cams and projecting pistons. The steam is admitted and exhausted by a notched wheel, provided with a series of valves having channel-ways that receive the steam and discharge it in front thereof.

Claim.—1. A wheel, B, having the steam-cut-off cams d arranged between the pistons D, as described.

2. A notched wheel, F, provided with the series of valves G having channel-ways that receive steam at f^2 and discharge it in front thereof, as described.

135,790.—*Harness and Saddle Pad.*—GEORGE ELSEY, Sterling, Ill.

The pad is made of sheep-skin with the wool turned inwardly.

Claim.—A harness or saddle pad, composed of sheep-skin or its equivalent, retaining the wool or hair, and having the same turned inward to form the packing, substantially as specified.

135,791.—*Sad-Iron.*—JOSEPH T. FEWKES, Philadelphia, Pa., assignor to himself, JOSEPH L. WILKINS, and W. CLARENCE CRANMER, same place.

A shell is used which has a post rising from its bottom and another post rising from the core, so that both posts meet near the center of the iron, and are there engaged by a locking-plate.

Claim.—1. The single post C rising from the shell A, in combination with the single post D rising from the core and arranged centrally with said shell and core in relation to the locking-plate, substantially as and for the purpose set forth.

2. The operating-lever J, in combination with the locking-plate G, and with the shell A, core B, and posts C D, substantially as and for the purpose set forth.

3. The guard H on the locking-plate G, in combination with the posts C D of the shell and core, substantially as and for the purpose set forth.

135,792.—*Car-Spring.*—GEORGE FRANKLIN, Philadelphia, Pa.

Claim.—1. A spring composed of plates A connected together at their ends, and arranged in zigzag form to cause the spring to act in the manner of an elliptical or spiral spring, substantially as described.

2. The scrolls a and a′ on the ends of the plates A for connecting the latter together, substantially in the manner and for the purpose set forth.

135,793.—*Razor.*—ELIJAH A. FREEMAN, Moscow, Pa.

The back of the razor blade is separate from the cutting-blade and both are pivoted together and to the handle at a point near one end. The back is grooved to receive the blade. When the razor is to be ground the back can be turned back out of the way until the sharpening process is completed. In this way a thinner edge can be easily put upon the blade.

Claim.—The combination of a razor blade and back pivoted together and to the handle at points near one end of each, the back being grooved along its front edge to receive the blade, substantially as described.

135,794.—*Cut-Off and Reversing Valve-Gear for Engines.*—RONERT MCC. FRYER, Nashville, Tenn., assignor of one-half his right to GEORGE W. SAULPAW.

Devices for changing the position of the eccentric which operates the valve of a steam or other engine, whereby the valve may be reversed, or have its cut-off action varied or adjusted to stop the engine.

Claim.—The combination of the rack M, the toothed sector N with its elbow N′, the rod O, the revolving support or box P, the block K of the revolving shaft F, and the eccentric H with its slot b, substantially as and for the purposes herein set forth.

135,795.—*Valve-Gear and Connections for Steam and other Engines.*—ROBERT MCC. FRYER, Nashville, Tenn., assignor of one-half his right to GEORGE W. SAULPAW.

Claim.—1. The combination of the crank C with the cross B or its equivalent, the crank D of the engine shaft E, and the piston-rods a a′ of the cylinders A A′, the whole being combined and arranged for operation as described.

2. The combination, with the elements recited in the preceding clause of claim, of the secondary shaft F, the wheels S S, the cross B′ or its equivalent, the eccentrics D′ D′, and the valve-rods e e′, substantially as and for the purposes herein set forth.

135,796.—*Valve-Gear for Engines.*—ROBERT MCC. FRYER, Nashville, Tenn., assignor of one-half his right to GEORGE W. SAULPAW.

A single eccentric operates two valves.

Claim.—The combination, with the revolving shaft E of the engine and its operating-cross B or its equivalent, of the secondary cross B′ or its equivalent, the eccentric D′, the slide C′, and the valve-rods e e′, the whole being arranged in relation with each other for operation substantially as specified.

135,797.—*Nail-Cutting Machine.*—CHARLES W. GLIDDEN, Lynn, assignor to JAMES W. BROOKS, trustee, Boston, Mass.

The nails are cut, heads and points, from a plate of the width equal to the length of the nails being cut. The outer end of the plate or bed upon which it rests is swung laterally after each cut in the usual manner for tapering the nails. Pivoted to this bed are two arms, the ends of which are alternately brought under the point of the nail being cut by the movements of the bed, so that when the nails fall, after being cut, their points will strike the ends of the arms and the nails will be tipped headforemost.

Claim.—In combination with a nail-plate feeding and cutting mechanism, mechanism for canting the nails and causing them to be delivered in uniform position, substantially as described.

135,798.—*Shedding Mechanism.*—WILLIAM GMEINDER, Reutlingen, Germany.

A graduated spring-tension is given to the heddle motion by means of vibrating levers, their inner ends taking hold of the heddles and one end of a spiral spring being suspended upon the lever between its fulcrum and outer joint by means of a sliding or rolling yoke, in such manner that the point at which the power of the spring acts upon the lever shall be farthest from the fulcrum when the lever is down and the heddle at rest; while with the upward motion of the lever the spring-yoke shall pass toward the fulcrum of the lever, and thus diminish its power to a minimum of resistance as the heddle approaches its highest position.

Claim.—In combination with the harness of a loom, the levers p p, springs d d, yokes s s, rollers f f, all relatively arranged to operate in the manner and for the purpose set forth.

135,799.—*Furnace-Grate Bar.*—ROBERT C. GRAVES, Barnesville, Ohio.

Claim.—The oscillating grate-bars, constructed in sets of three, having the side bars a of less depth than the middle bar A, as shown, in combination with the reciprocating bar D, constructed with recesses to allow limited play to the bars a, substantially as specified.

135,800.—*Wheel-Plow.*—WILLIAM S. GRIMSHAW, Pittsfield, Ill.

To lower or depress the plow a foot-lever hinged to the axle-tree is so shaped that it falls upon the cross-piece of the frame, while at the same time its forward end is convenient to the foot. When pressed upon by the foot it pushes down the frame containing the rock-shaft, to which the end of the plow-beam is fastened.

Claim.—1. The combination of the movable frame D D with the axle-tree B, said frame having the rock-shaft E, to which the plow-beam is fastened, substantially as described.

2. The rod P attached to the rock-shaft E and the plow-beam, and acting as an adjustable brace and guide to the plow.

3. The foot-lever K, in its combination with the axle-tree B and the frame D D, acting as a convenient and efficient device for lowering the plow.

4. The combination of the movable frame D D, the rod P, and the foot-lever K acting together, substantially as described, and for the purposes herein set forth.

135,801.—*Bustle.*—JOHN H. HALL, Ansonia, Conn.

Two crescent-shaped pockets, formed in one body and divided by a line of stitching, and being filled with suitable stuffing, have two similar pockets overlying them in such a position that the outer pocket of the upper pair shall come within the hollow between the lower pair.

Claim.—The herein-described bustle, consisting of the under pockets or parts A B combined with the overlying pockets or parts C D, united at the band E, and the parts having the relative position to each other described.

135,802.—*Iron Bridge.*—DAVID HAMMOND, MICHAEL ADLER, and JOB ABBOTT, Canton, Ohio.

Improvement in iron bow-string bridges of long span, by which lateral and vertical stiffness under rolling loads is enhanced without too great increase of cost.

Claim.—1. The combination of an iron-lattice brace-post with the arch and brace-beam of an iron bow-string bridge, said post having a vertical adjustment either at the arch or chord end, or at both of said points, substantially as and for the purpose specified.

2. The filling-plate V, in combination with the bent parts of side bars of a lattice brace-post, F, for the purpose of preventing the buckling of said bent parts when the post is subjected to a compressive strain, substantially as specified.

3. The arch-bolt F′, having a flattened head or "beaver-tail," f′, with recessed faces to receive post-bars f f, substantially as shown and specified.

4. The chord-bolt E with broad head c, in combination with the inside bars f of the lattice brace-post of a bow-string bridge, substantially as and for the purpose specified.

5. The combination, with the arches of a bow-string bridge, of an iron-lattice girder, Fig. 5, placed between said arches, and rigidly secured thereto by plates e e attached to its corners, and secured above and below the arch by a bolt run through said plates and arch, substantially as and for the purpose specified.

6. The combination, with the end of a raised lattice-girder for bow-string bridges, of an arch-bolt, H, rigidly secured to said girder, and extending down through the arches of said bridge, substantially as and for the purpose specified.

7. A raised lattice-girder for bow-string bridges, having its end bars g′ g′ arranged with bearings on the extreme horizontal parts of the arch A, and with a bolt, H, rigidly securing it to said arch, substantially as specified.

8. The combination, with the raised lattice-girder, Fig. 7, and arch A, of a tie, M, or strut M′, for holding said girder against the action of the lateral ties P, substantially as specified.

9. The combination, with the arches and brace-posts of an iron bow-string bridge, of the deep iron lattice-girder, Figs. 6 and 13, secured to the arches at its upper corners by a plate, e or e′, and at its lower corners to the posts at points considerably below the

arches by one or more bolts, 16 or 17, substantially as and for the purpose specified.

19. The girder-block G'', secured on the lower corners of the deep lattice-girders specified in preceding clauses, substantially as and for the purpose specified.

11. The combination, with the brace-beam, post, and overhead lattice-girders of a bow-string bridge, of a tension-rod, S, extending from the outer post of brace-beam across the post to the overhead lattice-girder, substantially as and for the purpose specified.

12. The lateral hitch-blocks N for the attachment of the lateral ties to the brace beams or overhead girders, said blocks having holes arranged for the passage on both ties and beveled end faces for the nuts of said ties, and being secured to said beam or girder by bolts or rivets passing through the body of the block and the flanges of the beam or girder, substantially as specified.

13. The lateral compressive strut Q, secured to the arches of a bow-string bridge at the heads of the intermediate posts, and connected at its center by lateral ties, to the ends of the lateral strut or girder at the head of the brace-posts, substantially as and for the purpose specified.

14. The arch-block W, rigidly secured to the arch A, and having an eye or hole, in which the end bolt of the lateral strut Q can be secured by jam-nuts, substantially as specified.

15. The grooved washer Y' and wrought-iron tie-plate D, in combination with the chords C and post-bolt E or clamping-bolt 22, substantially as and for the purpose specified.

16. The tie-plate Y, consisting of a short piece of flanged iron plate or its equivalent, having its web cut away at *y y*, and with holes formed in its flanges for the insertion of the tie-pins *d'*, substantially as specified.

17. The cast end thimble *c*, having its end of the form of the section of the brace-beam T, and secured thereto by strap *c'*, fitting into the recessed part of thimble-body, and to the web of the brace-beam, substantially as specified.

18. The cast side thimble *c''*, having a rear flange, 13, fitting between the flanges at the brace-beam T, and secured thereto by strap 14, fitting into recessed part of thimble-body, substantially as specified.

19. A wrought iron double tubular arch, having as the base of construction a horizontal plate, with two column-segments at each side, said base having combined with it suitable plates, channel-bars, and segments, to form an arch of the required cross-section and lateral capacity, substantially as is herein specified.

20. The combination, with the lower chords and brace-posts of a bow-string bridge, of a pair of rolled T or channel beams, trussed by a hog-chain on the under side, and held from upward deflection by a tension-rod on the upper side, substantially as and for the purpose specified.

135,803.—*Stud for Fastening Neck-Ties.*—JOSIAH A. HARD, Lawrence, Kans.

The outside disk of a button or stud is provided with a loop adapted to receive any ordinary hook, which is attached to the tie.

Claim.—The button A having disk D', provided with the loop *b* adapted for connection with the hook B, substantially as and for the purpose specified.

135,804.—*Cloth-Measure.*—COLLIER V. HEMENWAY, New London, Ohio, assignor of two-thirds his right to J. H. B. BEATTIE and A. A. POWERS, same place.

A narrow finger-extending from the handle of the portable instrument carries a shaft having a small roughened roller, which projects through an opening in one side of the finger. The instrument is designed for measuring cloth in the roll or package by inserting the said finger at a suitable place between the folds at the end of the roll and passing it around one or more turns of the cloth, a spring keeping the single thickness of cloth in contact with the small roller, which, by proper gear, indicates the length upon the dial at the opposite end of the handle.

Claim.—The burr *a* and pressure-spring *b*, in combination with the mechanical movement described, shaft F, pointer E, and indicator *c*, in the manner as and for the purpose specified.

135,805.—*Washing-Machine.*—FRANCIS W. HENSON, Philadelphia, Pa.

A wire cylinder, with beaters inside, corrugated to give motion or action to the clothes being washed, is attached to a shaft extending through it, with gears upon its end inside the casing, which shaft passes through the journal-box constructed in two parts and held in position by a jam-nut.

Claim.—1. A washing-machine, in which are combined a casing, B, to contain soap-suds, and a rotating wire-gauze cylinder or cage, A, constructed with internal rubbers to contain the clothes or other articles to be washed.

2. The combination, substantially as described, of the casing B, cylinder or cage A, gear-wheel *b'*, and the detachable crank D and its pinion *a*.

3. The combination, with the crank-shaft D and slotted end of the casing, of the clamping-plates *m* and *m'*, bolt or bearing *l*, and nut *q*, all substantially as and for the purpose specified.

135,806.—*Carbureting Apparatus.*—THOMAS HOLMES, Brooklyn, N. Y.

Claim.—The tray A and tubes *i* above the septums *e* in the vessel *a*, in combination with the supporting-bars *f g*, supply-vessel *n*, equalizing-pipe *o*, and pipe *m* to the tray A, as and for the purposes set forth.

135,807.—*Ditching-Machine.*—WILLIAM T. HOSKINS, Livia, Ky.

The block is elevated and dropped in a progressive frame in the ordinary manner. The wedge-shaped portion forms the ditch, while the truncated rear portion compacts the earth previously impressed by wedge *a*.

Claim.—A wedge-shaped ram, elongated as at *a*, and truncated as at *b*, substantially as and for the purpose hereinbefore set forth.

135,808.—*Washing-Machine.*—EDWIN HOYT, Stamford, Conn.

An upper corrugated roller revolves on the top edge of a box or tub. An inner frame, resting on springs, supports the under smooth roller, against the opposite sides of which are strips of India rubber to prevent the clothes from winding around it.

Claim.—The washing-machine, consisting of the long corrugated roller A, the short smooth roller B, the supporting and guiding-frame C J, the pliable bearing-strips D, the springs F, the supporting cross-bar E, and the cleats I, the whole arranged with respect to each other within the frame G H, as herein shown and described, for the purpose set forth.

135,809.—*Metallic Washer.*—MOSES G. HUBBARD, Syracuse, N.Y.

The washers are made of steel plate of uniform thickness, round and curved in one direction only.

Claim.—The form and construction of the elastic washer, substantially as and for the purposes set forth.

135,810.—*Middlings-Purifier.*—WILLIAM W. HUNTLEY and ABEL P. HOLCOMB, Silver Creek, N. Y.

A disintegrating-head, in connection with a wind-trunk and exhaust-fan, separates the middlings from the foreign substances, which are afterward passed through a series of graduated sieves.

Claim.—1. In a machine for purifying middlings, the combination of the disintegrating-head, an exhaust-fan, and a wind-trunk, when constructed substantially as described, and for the purpose set forth.

2. The combination of the hood D, the feed-hopper C, wind-trunk B, and fan F, when constructed and arranged to operate substantially as and for the purpose set forth.

3. The combination, in a machine for purifying middlings, of a disintegrator and a suitable series of sieves, the parts being constructed and arranged to operate with reference to each other, substantially as set forth.

135,811.—*Process of Purifying Middlings.*—WILLIAM W. HUNTLEY and ABEL P. HOLCOMB, Silver Creek, N. Y.

Middlings are simultaneously subjected to a beating action, which disintegrates lumps and loosens smut, dirt, &c., and to a blast of air, which carries off loosened impurities, then bolted over graduated sieves.

Claim.—The mode of purifying middlings, previously to their being separated into different grades by bolts or sieves for regrinding, by subjecting them to the action of whippers or beaters while passing through a current of air, substantially in the manner as set forth.

135,812.—*Combined Millstone Tram and Level.*—JOHN HUTCHINS, Portsmouth, Ohio.

The eye of the tram has adjusting-screws on each side. A level is attached adjustably to the tram, with the outer end of tram slotted and an adjustable quill arranged in slot, so that it can be used with different-sized stones.

Claim.—1. A millstone-tram and adjustable level combined, substantially as described.

2. A millstone-tram having an eye to receive the spindle provided with screws to fasten the eye to the spindle, in combination with an adjustable level, so that by the rotation of the spindle it can be plumbed and the stone leveled at the same time, substantially as described.

3. The combination of the slotted tram A, threaded stem *h*, tapped collar *l*, nut *m*, and quill *c*, all arranged as specified.

135,813.—*Corn-Planter.*—JOSEPH INGELS and WILLIAM R. MOUNT, Milton, Ind., assignors to "HOOSIER DRILL COMPANY," same place.

The cylindrical seed-box has a chamber upon the side of the seed-spout. The seed-valve is disk-like and rotates in a horizontal plane. A ball is placed in the chamber and is held by a keeper, and as the disk rotates the ball falls successively into the seed-holes and jars out the seed.

Claim.—In combination with the shaft *c* and its half-clutch fastened thereon, the combined half-clutch and worm 12 and clutch-lever E for moving said clutch and worm longitudinally on the shaft *c*, as and for the purpose described and represented.

2. The combination of the worm 2 that is always in gear with its pinion, the shaft C, gear *m*, and adjustable box or bearing *d*, so that the worm and gear may always remain in contact, and any wear compensated for by moving the worm and shaft up to the gear *m* without disarranging its other duties, substantially as described.

3. In combination with the dial or cell plate I, the chamber J in the hopper and the cage and ball arranged to operate inside of said chamber, and in connection with said dial-plate, for knocking or jarring the grains out of the cells at or over the dropping point, substantially as described.

135,814.—*Pad for Horses' Feet.*—JONATHAN JOHNSON, Lowell, Mass.

The buckling-strap is passed through the loop on the heel-piece; the boot is then placed upon the foot, the pad entering the cavity formed by the shoe. The heel-piece is then turned up and the buckling-strap passed through the buckle or through the loops of the fastenings. Upon drawing up and buckling the strap the boot will be fastened in its proper position upon the foot.

Claim.—1. The cap-piece B, constructed as shown and described, and for the purpose set forth.

2. The combination of plate A, cap-piece B, and brace C with heel-piece E and strap D, substantially as and for the purpose specified.

135,815.—*Carriage-Step.*—GEORGE A. KENNE, Lynn, Mass.

The pad is formed of India rubber in such shape that water will not remain upon its surface, and, by means of clamps combined with the pad in its manufacture, it may be readily attached to the metallic step.

Claim.—1. The foot-pad C, provided with the system of grooves *c* and projections *c'*, substantially as and for the purpose specified.

2. In combination with the step-tread B and pad C, the clamps E, substantially as and for the purpose shown.

135,816.—*Straw-Cutter.*—JOHN F. KELLER, Hagerstown, Md.

Between the feed-rollers and the stationary knife-edge is a bar in line with this knife, inclined on both sides, to guide the straw and to admit of sharpening the blade.

Claim.—The combination, with the feed-rollers of a fodder-cutter and fixed knife, E, of the intervening and inclined surfaces *f f'*, substantially as and for the purpose specified.

135,817.—*Earth-Closet.*—BENJAMIN L. KENT, Coatesville, Pa.

The earth-box has an open bottom, from which proceeds a flexible discharge-tube to an opening in the rear portion of the seat-lid. A U-shaped "cut-off," consisting of a bent rod provided with rearwardly-extending arms, is pivoted to the back part of the lid, so that by the action of the seat-lid the discharge of earth is regulated as it passes from the earth-box to the bucket.

Claim.—1. In an earth-closet, the combination, with the seat, bucket, and elevated earth-box, of a flexible discharge-tube and an automatic cut-off, substantially as specified.

2. The U-shaped cut-off I attached to the hinged lid D, in combination with the flexible tube H and transverse rod I, substantially as and for the purpose set forth.

135,818.—*Seal-Lock.*—GEORGE L. KITSON and JOSEPH BENNOR, Philadelphia, Pa., assignors to themselves and GEORGE W. CARR, same place.

The lock is provided with a rotary key-post having an extension armed with points which penetrate a sheet of paper confined between a hinged cap and the back of the lock-case, so that when the post is rotated, by means of a key or otherwise, the paper will be mutilated, thereby indicating that the lock has been tampered with.

Claim.—The post B, slotted to receive a key which operates the tumblers of the lock, provided with points, as set forth, and confined so as to have a rotary motion only, as specified.

135,819.—*Envelopes.*—RICHARD K. KUHN and THOMAS O. ATKINSON, Doylestown, Pa.

One end is cut and folded to form an angular projection from the main pocket, which extension may be torn off without injuring the contents of the envelope.

Claim.—An envelope having one or more angular projections in continuation of the main pocket, adapted to be torn or cut off to open the package without injuring the contents of the latter, substantially as described.

135,820.—*Piano Action.*—LEOPOLD KÜHKER, New York, N. Y.

Claim.—The shank of the key A, formed with the incline F and supporting the jack B, and the check D, in combination with the counterweight E, and hammer C, all constructed and arranged in respect to each other, as herein shown and described.

135,821.—*Separator for Thrashing-Machines.*—HENRY H. KURTZ, Salisbury, Pa.

A secondary fan and shoe placed underneath the ordinary fan and shoe receives the grain therefrom and completes cleaning. Secondary fan and shoe are of less width than the other, and so boxed up as to exclude dust and dirt.

Claim.—The combination, with the customary chaffing-shoe of a grain thrashing and separating machine, of the supplemental shoe B having a longitudinal shake and made of less width so as to have room at its sides for the operating mechanism and for the free passage of air to the fan P, as described.

135,822.—*Securing the Covers on Boxes for Stop-Cocks for Water and Gas Service-Pipes.*—FREDERICK H. LAFORGE, Waterbury, Conn.

Upon the under side of the cover are connected dogs by means of fulcrum-pins passing through slots in the dogs, which latter are arranged at their outer ends to catch into opposite sides of the box. The inner ends of said dogs are pivoted to a sliding nut operated by a screw entered from the outside of the cover so that the turning of the screw in opposite directions will release or fasten the dogs in the interior of the box.

Claim.—The combination, with the wooden box A and its cover B, of the dogs C C, made capable of operation from the exterior, and arranged to catch into the sides of the interior of the box, substantially as specified.

135,823.—*Knitting-Machine.*—JONATHAN LEONARD, Attica, Ohio.

The main elevating-cam has a pin projecting into the cam-groove in the wheel. At the end of each reciprocation of the carriage one of the cross-arms strikes one of the latches and the wheel is turned, thus raising or lowering the main cam, as the case may be.

Claim.—The wheel C, provided on the under side with a cam-groove, *c*, and on the upper side with cross-arms A A, in combination with the cam D and latches E E, substantially as and for the purposes herein set forth.

135,824.—*Nail-Carrier for Sole-Nailing Machines.*—ASA S. LIBBY, Lawrence, Mass.

A carrier-tube made to draw back to receive the nail-wire when the driver is down.

Claim.—The nail-carrier tube formed with movable jaws, substantially as described.

135,825.—*Road-Roller.*—ANDERS LINDELOF, Brooklyn, N. Y.

Claim.—1. The steering roller or rollers connected with the main frame by a cross joint or pin, in connection with the king-bolt, by which they are steered, to provide for a free or universal adjustment of said rollers, substantially as specified.

2. The yoke or saddle D constructed to form outside end bearings to the steering-roller or its axle, in combination with the cross-joint or pin *f* and the king-bolt *d*, connecting the steering roller or rollers with the main frame, essentially as herein described.

135,826.—*Grain-Binder.*—SYLVANUS D. LOCKE, Hoosick Falls, N. Y.

The cord is held between the two rigid jaws, one of which is provided with a solid hook and the other with a depression, so that the cord is prevented from slipping out while rotating.

Claim.—A rotating hook constructed with two rigid jaws having a concave front and solid retaining-shoulder, substantially as described.

135,827.—*Sewing-Machine Table.*—HENRY LOTH, Philadelphia, Pa.

The leaf is connected to the table by double-jointed hinges so that when the leaf is dropped it is drawn in out of the way, and rests against the supporting-leg of the table.

Claim.—The combination, substantially as described, of double-jointed hinges D with the leaf A and table B of a sewing-machine, for the purposes set forth.

135,828.—*Steam and Air Brake.*—WILLIAM LOUGHRIDGE, Baltimore, Md.

Claim.—1. The cylinder, piston-rod, pulleys, pulley-frame, the intermediate rope *h* or chain, when combined and operated with the hand-brake mechanism, in the manner and for the purposes as set forth.

2. The right-angled coupling-pipe *k* having a projecting pin, *y*, the ball *v*, and nut *u*, when constructed and operated for the purposes substantially as set forth.

3. The U-shaped pipe arranged with its arms or connecting-pipes passing up through the floor or platform of the car, with the main pipe entering below, and with the couplings above, substantially as shown and described.

135,829.—*Plow.*—JOHN LOVE, Cusseta, Tex.

The plow-irons are provided with long shanks fitting into a slot in the beam. The shanks are perforated and bolted through the curved and slotted brace.

Claim.—The subsoiler D, pulveriser C, and furrow-opener E, provided with long shanks F relatively adjustable through plates B B and long oblique slot of beam A', as and for the purpose set forth.

135,830.—*Screw-Cutting Device.*—JOEL BACON LOW, Ravenna, Ohio.

The dies are closed by a projecting flange on the end of a sleeve that slides on the cylinder, said flange being beveled on its outer edge, but flat on top, is forced under the ends of three bell-crank levers, in which are fastened the cutting-dies, by a lever having pinions on one end pivoted in the sliding sleeve, and working in a rack formed on the cylinder.

Claim.—The combination of the swinging die-holder A, the barrel D having a rack, *i*, the ring F, sliding sleeve G, and lever H having a segmental pinion, *h*, all arranged as specified.

135,831.—*Back-Band of Harness-Saddles.*—SAMUEL F. MARSHALL, Wilmington, Del.

The shaft-tug is made to swing on a pivot, and may be detached from the back-strap.

Claim.—The combination of the sections A and B, the latter having stud b^1 with ears b^2, and the former having opening a^2 with slots a^3, substantially as described.

135,832.—*Miter-Box.*—JOHN A. MCKINSTRY and WILLIAM WALDEN, Springfield, Mass.

The guide-posts, connected by the sliding bars, are fastened in any position by the double cam-wheel wedging the clamps on the front bar.

Claim.—In combination with a miter-box, the cam or clamp for setting the saw-guides at any desired angle or fraction of a degree, substantially as set forth.

135,833.—*Hold-Back.*—MICHAEL D. MYERS, Schuyler, N. Y.

Should the shaft become detached through derangement of the harness or other cause the hold-back fastenings will become automatically detached, freeing the animal from the wagon.

Claim.—The combination of the bed-piece A, its hook B having a projection, H, as herein described, and spring D with the link E having an elongated point, G, for the purpose specified.

135,834.—*Dash-Rail for Carriages.*—BAXTER B. NOYES and OSCAR G. STRATTON, Greenfield, Mass.

Claim.—The plate C, provided with the ears, in combination with the rail A and brace B, all constructed and arranged substantially as described.

135,835.—*Bed-Bottom.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

The slat is pierced with holes at each end so that a looped wire passing through them straddles the slat and forms a reversible hook to hold the end of the spring. At the coiled end of the spring the ends are driven into the bar, so that the arms of two adjoining springs are held by a broad-headed nail clamped down. The head-rest the slats of which work between the slats of the bed-bottom, is pivoted to the lower side of the rail, and operated by a ratchet-which engages with notches on the head-bar.

Claim.—1. The spring-holder formed by the double wire passing through holes in the slat, and forming a reversible hook or holder, as described.

2. Fastening the spring to the bars by inserting the ends through the bars and clasping the contiguous arms with the broad-headed nail, as described.

3. The head-elevator, pivoted to the lower side of the rails, and having the pawl and ratchet which engage with notches on the head-bar.

4. The combination of the frame and slats with the spring, the spring-fasteners, the holding-hooks, and the pivoted elevator, with ratchet and pawl, all constructed as described, and for the purposes set forth.

135,836.—*Leather-Stretching Frame.*—CHARLES P. OLIVER, Newark, N. J., assignor of one-half his right to THEODORE P. HOWELL, same place.

The hide is thrown over the fixed cross-bar, and its edges are then secured to the adjustable bar, which is forced down by levers.

Claim.—The leather-stretching frame herein described, having bars A and D, levers *e* and *f*, wrist-*y*, perforated plate *a*, and wrench H, constructed and arranged substantially as specified.

135,837.—*Portable Extension Fence.*—ADAM W. OVERHOLSER, Duchoyquet township, Auglaize county, Ohio.

Base-blocks are attached at intervals to the extended oblique bars, and move as the fence is extended. The fence may be connected with the sill of a gate by one of the extended oblique bars entering a mortise in the sill.

Claim.—1. The improved extension fencing composed of the oblique pivoted bars *f* and the movable blocks G, substantially as and for the purpose specified.

2. The extension fencing composed of the oblique pivoted bars *f*, one of which is extended, in combination with the gate-base A having the notch *g*, substantially as specified.

135,838.—*Hot-Air Furnace.*—HENRY L. PALMER, New York, N. Y.

The corrugated wall of the chamber of combustion and the corrugated jacket encircling it are so placed together that a series of hot-air tubes are formed around this chamber.

Claim.—Inner and outer corrugated plates, arranged in juxtaposition in a hot-air heater, so as to form heating-flues in one or more sets.

135,839.—*Railroad-Track.*—LOUIS H. PETELER, New Brighton, N. Y.

The tongues prevent displacement, while the wedge-keys firmly clamp the rails in place.

Claim.—The tongues *c* in the sides of the recesses *a* opposite the key-seats *b*, in combination with grooves *d* in the rails E, substantially as set forth.

135,840.—*Corn-Husker.*—PETER PHILIP, Stockport, N. Y.

Rolls tear the ears from the stalk, and the ears falling on outer rolls the husk is torn from it on its descent.

Claim.—1. The picking-rolls A B geared together at both ends by spiral gears, the teeth of which run in contrary directions at opposite ends of the rolls, substantially as and for the purposes set forth.

2. The grooved picking-rolls A B having longitudinal ribs *c* and corresponding grooves or depressions *c'*, substantially as and for the purpose specified.

3. The rolls C D geared together by spiral gears, in combination with the collar C^2 and groove D^2, substantially as and for the purpose specified.

135,841.—*Corn-Husker.*—PETER PHILIP, of Stockport, N. Y.

Reversed grooves and elevations on the end of the picking-rolls prevent the stalks from clogging the journals and bearings. Curved shield protects the ears of corn from injury from the lower picking-roll, and prevents the gearing of the husking-rolls from being clogged by detached strips of husk and stalk. Gravitating plate loosely suspended to prevent any ears bounding upward from the husking-rolls as they fall thereon from the picking-rolls. A table having diagonal partition guides the stalks to the proper end of the picking-rolls.

Claim.—1. The picking-rolls constructed with annular grooves and elevations A^1 B^1 and spiral grooves and elevations A^2 B^2, running in a direction reverse to the spiral grooves and elevations upon the main portion of the rolls, substantially as and for the purposes specified.

2. The shield C, constructed and arranged, with reference to the picking-rolls and the gearings D and E, substantially as and for the purpose specified.

3. The plate H, arranged above a pair of husking-rolls, being hinged at its upper end, and adjustably suspended by a cord or chain, I, at its lower end, substantially as and for the purpose specified.

4. The feed-table K K', constructed with the diagonal guide-board L and overhanging inclined guide board M, substantially as and for the purposes set forth.

135,842.—*Wrench.*—NATHAN L. POST, East Cleveland, Ohio.

By means of the handle the wrench is held to its work with one hand, while it is turned with the other by means of the shank A. A rubber ring is attached to the head so as to project through at the corners, and by its elasticity retain the nut after being taken off.

Claim.—1. The wrench A, when used in combination with a handle, C, pivoted to the same, as and for the purposes set forth.

2. The head B of a wrench, constructed as herein described, and used in combination with an elastic or flexible ring or block, G, as and for the purpose set forth.

135,843.—*Tool for Facing Bung-Holes.*—TREAT T. PROSSER and GEORGE W. GILLETT, Chicago, Ill.

An iron plug fitting the bung-hole of a barrel is provided with a central aperture which receives the guide-pin of the cutting-tool.

Claim.—The combination of the cutter B, stem or spindle C, and plug D, substantially as and for the purpose specified.

135,844.—*Bed-Bottom.*—ROLAND RAKESTRAW, Wyoming, Ill.

The foundation is formed of curved slats, with two side and one central curved slat below. At the ends they are clamped between bars. Upon two crossed slats are coiled springs.

Claim.—In a bed-bottom having curved or bowed slats A B, the combination of the rods *c c* and cross-slats or bars *a b* having wire or cord *n* arranged to fasten the ends together, in connection with the arrangement of the cross-slats *d d* provided with spiral springs *f*, in the manner and for the purpose as herein shown and set forth.

135,845.—*Grain-Register.*—STEPHEN RAMER, Winona, Minn.

The tallying arm or lever trips a four-toothed ratchet-wheel carrying a cam, which actuates the pawl of the count-wheel only on the alternate throws of the tallying lever; the intermediate throws bringing a movable arm marked "½" beside the stationary number, and withdrawing it, as the whole number is shifted, the object being to register half-bushel measures.

Claim.—1. The ratchet E, cam F, lever D^2, lever F^1, pawl G, arms G^1 G^2 G^3, pawl D^1, and spring *g*, in combination with the graduated ratchet-disk C, all constructed and arranged substantially as shown and described.

2. The combination, with the cam F and graduated disk C, of the lever H bearing the fraction-mark, operated by alternate movements of the arm G^3, substantially as specified.

3. The graduated toothed-bar m^1, in combination with the graduated disk C having the rim notched, the lever L, studs *c m*, and spring *L'*, substantially as and for the purpose specified.

4. The graduated bar m^2 having the teeth *m* N', in combination with the slotted blocks N and springs P, substantially as and for the purpose specified.

135,846.—*Machine For Distributing Fertilizers.*—ISAIAH M. REAMES, Oxford, N. C.

A box, open at top, with a hopper to be slung in front of the operator, is divided by a horizontal partition having an orifice adjusted by a slide. In each compartment, worked by pinions on the outside and a crank, is a horizontal spindle with a spiral plate around it. The seed is thus drawn to the orifice and then pushed to the outlet at the bottom of the box.

Claim.—The combination of the spirally-flanged conveyer-shafts E I revolving in opposite directions and arranged in the receiving and discharging compartments B C of a fertiliser or seed-planter, as herein shown and described.

135,847.—*Tin-Can-Soldering Machine.*—JOSEPHUS REDHEFFER, Philadelphia, Pa., assignor to WM. REDHEFFER, JAMES REDHEFFER, Jr., and THOMAS G. REDHEFFER, Kansas City, Mo.

A can-soldering cylinder has a gage-ring with pins supported therein to stop the can-stock at the desired point. The soldering-bar is adjustably attached to the gage-ring.

Claim.—1. The combination of a can-soldering cylinder and a gage-base or ring, either or both of which are adjustable with relation to the other, substantially as described, whereby the machine is practically adapted to the soldering of cans of different lengths.

2. The combination, with the expanding and contracting cylinder, of the gage-pins arranged to bear upon the surface of the cylinder, and to maintain proper contact therewith at all times, substantially as and for the purposes specified.

3. The soldering-bar G, secured to its base at its fulcrum by a connection which is adjustable on the circumferential line of the cylinder, substantially as described, whereby the bar may be brought at will to bear at different points on the cylinder, as and for the purposes specified.

135,848.—*Show-Case.*—WILLIAM H. REIFF, Philadelphia, Pa.

The case has inclined glass sides and ends, and an inclined door.

Claim.—In a show-case constructed with glazed front, sides, and ends, the arrangement of the door in an inwardly-inclining position, as shown and described.

135,849.—*Car-Coupling.*—JOHN ROYAL, MOSES A. LENTZ, and JEREMIAH M. DEINERT, La Fayette, Ind.

On the bottom of the bar, which acts as a stop for the pin, is a spring notched in two places, the notch nearest the handle retaining it wholly in the draw-head, and the furthest notch preventing its being entirely withdrawn.

Claim.—The combination of the slide C with spring *d* and catches *f f*, the swinging pin B, and the mouth of the bumper in which is a slot to allow the pin B to play, as and for the purpose herein set forth.

135,850.—*Plow.*—HENRY SELICK, Lewistown, Pa.

The beam is attached to the mold-board by means of a lug formed thereon, whereby a central draft may be obtained.

Claim.—The lug *b* on the inner side of the mold-board D, in combination with the beam A, the bolts *c d*, and sheath C, the whole being arranged substantially as and for the purposes herein set forth.

135,851.—*Toy Velocipede.*—WILLIAM SELLERS, New York, N. Y.

To vary the movements of the toy, moved by a clock-work attachment, the wheels, one or both, are connected or relieved from the axle by a clutch attachment so as to drive the toy in curves or straight lines.

Claim.—A toy velocipede, the driving-power of which is secured to an axle supported by two wheels, each of which is provided with a fastening device, serving to fasten the same to the axle or to release it therefrom, substantially in the manner and for the purpose herein shown and described.

135,852.—*Winding Mechanism for Spinning-Jacks.*—JAMES SHAW, Ballard Vale, Mass.

The radial arm is attached to the under side of the carriage, and, while traveling with it, it is vibrated by a band passing around the pulley on one end of the shaft at right angles to the screw, on the other end of which is a spur-gear which engages and turns another gear provided with a crank-pin working in a slot in the radial arm. This shaft also carries a sliding sleeve, on which are two bevel-gears, and which is grooved to receive one end of a pivoted lever connected with and operated from the counter-faller. Over or under tension of the yarn raises or lowers this lever and brings one or the other of the bevel-wheels into gear with that on the screw so as to turn the latter and govern the winding in the usual way.

Claim.—The combination of the lever A, the sleeve *e*, the three bevel-gears *b c d*, the pivotal shaft *a*, the pulley *g*, the gears *m m*, and stud *c'*, arranged and combined with the bracket A, the slotted radial arm *b'*, and operative screw *b'* of the nut *m'*, substantially as specified, the said lever to be connected with the follower so as to be operated by it, as described.

135,853.—*Cotton or Woolen Can.*—HENRY W. SHEPARD, New York, N. Y.

Claim.—As a new article of manufacture, a metallic can for cotton or woolen factories, consisting of the cylinder A, bottom B, and its inner turned-down hoop C formed out of a single piece of metal, and the outer band or hoop D, the several parts being attached together through bead or groove connections and without solder or rivets, substantially as described.

135,854.—*Cotton or Woolen Can.*—HENRY W. SHEPARD, New York, N. Y.

Claim.—As a new article of manufacture, a can consisting of the bottom and hoop A B, formed out of a single piece of metal, cylinder G, and band D, when the same are so connected by beads or grooves as to avoid the use of solder in attaching the several parts together, as and for the purpose specified.

135,855.—*Sheet-Metal Vessel.*—HENRY W. SHEPARD, New York, N. Y.

Claim.—As a new article of manufacture, the pail or vessel A, consisting of the cylinder B formed with a single-lap joint and having beads or grooves *b b*, the bottom C, and hoop D, when the latter is formed with beads or grooves *d d*, and out of the same piece of metal with the bottom, the whole being constructed, combined, and arranged substantially as described.

135,856.—*Wrench.*—JOSEPH SMILEY, Franklin, Pa.

By pressing the thumb on the stud the pin is relieved from the notches in the stem, when the outer jaw may be moved as required.

Claim.—In a hand-wrench, the combination, with the recessed and perforated stationary jaw B, of the serrated stem *b* of the movable jaw, and the spring-catch E, and thumb-stud *c*, substantially as specified.

135,857.—*Piano Sounding-Board.*—CHRISTIAN F. T. STEINWAY, New York, N. Y., assignor to himself, WILLIAM STEINWAY, and ALBERT STEINWAY.

To prevent the sounding-board bars from warp or giving way.

Claim.—The employment of one or more strips of hard wood inserted into the ribs B of the sounding-board of a piano-forte, substantially in the manner and for the purpose herein shown and described.

135,858.—*Bustle.*—THEODORE STOCKMAER, New York, N. Y.

The bustle is made of two or more skirts of corrugated material attached to the same waistband, and graduated in size, the largest being underneath and the smallest the top one.

Claim.—A bustle composed of two or more tiers of fluted, corrugated, or plaited material, arranged in relation with each other, as described, and attached at their upper edges to the waistband or strap, substantially as specified.

135,859.—*Washing-Machine.*—JOHN STRAHL, Lee, Ohio.

A box of ordinary form, with a frame for holding the rollers in the lower rubber, with a rubber suspended over it, all located and working in a metallic lining which is fitted to the form of the box, and may be removed at will for other purposes, rinsing, &c.

Claim.—In the washing-machine herein described, the combination of the boxes A and B, frames C and G, and rock-shaft *c*, constructed and made removable one from the other at will, as specified and shown.

135,860.—*Call-Bell.*—HENRY STRATTON, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place.

The bell is attached to its base in an inverted position, and the hammer is pivoted outside of and above its mouth, under a suitable cap or cover.

Claim.—The combination of the inverted bell C upon a suitable base, A, the striking instrument, pivoted above and arranged to swing across the mouth of the bell in a plane substantially at right angles thereto, the neck or cover E, and piston *b*, substantially as specified.

135,861.—*Three-Horse Evener.*—BENJAMIN W. SUTHERLIN, Fillmore, Minn.

The draw-bar is pivoted to the tongue so that its arms will be unequal in length, that two horses may be attached to one side and one horse to the other, the draft being equalized by an arrangement of levers.

Claim.—The draft-evener, consisting of the transverse movable bar F having arms of unequal length, the oblique rods e^1, the bent lever E' having unequal arms, and transverse bar B, substantially as specified.

135,862.—*Sectional Steam-Generator.*—JEROME B. SWEETLAND, Pontiac, Mich.

Claim.—1. In combination with the bottom section of a sectional steam-generator, the hollow standards or legs E E with screw-caps G G on their lower ends, substantially as and for the purposes herein set forth.

2. The buttons or studs *b b* formed on or attached to the upper side of each section of a sectional steam-generator, substantially as and for the purposes herein set forth.

3. The within-described steam-generator, consisting of one or more central hollow hubs, A, radial arms C, hollow rim B, studs *b b*, and hollow legs E provided with screw-caps G, all substantially as and for the purposes set forth.

135,863.—*Scraper Attachment for Plows.*—JAMES P. SWOFFORD, Brownville, Miss.

Claim.—The combination, with the plow-beam A, of the adjustable and curved beam D provided with the scraper G, the said beam being perforated, as shown, and bolted to the beam at *e* through one of said perforations, and connected at its front end to the lower end of the short arm *d* pivoted to the plow-beam, all substantially as and for the purposes herein set forth.

135,864.—*Nut-Lock.*—DAVID O. THOMPSON and BENJAMIN A. RICE, Pontiac, Mich., assignors of one-third of their right to JEROME B. SWEETLAND, same place.

A metallic casing, one end thick and screw-threaded, the other forming a box in which is fitted a rubber nut, held in place by ears or tabs turned down over the end.

Claim.—The within-described nut-lock, consisting of the solid metal head A, with a central screw-recess and hollow chamber, B, rubber nut C secured by the bent projections D, and the screw-bolt E, passing through the rubber and metal parts A C, all as set forth.

135,865.—*Coating and Preserving Rope and Cordage.*—WILLIAM A. TORREY, Mount Clair, N. J.

Dissolve the rubber or gutta-percha in naphtha, oil of tar, benzine, turpentine, bisulphide of carbon, or mixture of these solvents, and add sufficient naphtha or dead-oil to preserve the compound and the rope.

Claim.—1. The improved method herein described, for coating and preserving rope and cordage, the same consisting in the application of a solution of India rubber, prepared as set forth.

2. The new article of manufactured rope and cordage coated or saturated with solutions of rubber or other gums at low temperature, as and for the purpose described.

135,866.—*Car-Coupling.*—ADDISON TRUXELL and FREDERICK J. WILLIAMS, Toledo, Ohio.

Claim.—1. The combination and arrangement of the hooked draw-bars A B, clevis D, arm E, rod F, and operating-lever G, substantially as and for the purposes set forth.

2. The knuckle-joint H, having its respective members attached to the operating-lever G, and arm E, substantially as and for the purposes explained.

3. The cam I and ring J, in combination with the lever G, as set forth.

135,867.—*Saw-Set.*—WILLIAM TUNSTILL, Brooklyn, E. D., N. Y.

Peripheral dies, formed by alternate inclines. The projections on one wheel, fitting into corresponding depressions on the other, are fastened behind two wooden wheels, which feed and steady the saw-blade while the dies are bending the teeth.

Claim.—Peripheral dies, made by inclined planes in alternate opposite directions around the edges of a pair of wheels, substantially as set forth, in combination with the guide-wheels A A, as set forth.

135,868.—*Sewing-Machine Fan Attachment.*—CORNELIOUS B. VERDIER, Athens, Ga.

The fan has a threefold adjustment.

Claim.—The inclined or bent arm C, rocking bar A, double socket B with set-screws *a b*, socket D with set-screw *c*, and fan G, the several parts being constructed and arranged as herein set forth.

135,869.—*Boiler-Furnace.*—CHARLES D. WILLIAMS, St. Paul, Minn.

Claim.—The combination, with the boiler D, of the furnace A and the perforated chambers H H, arranged in the bottom of furnace above the grate C, and communicating with the steam space or dome E by means of the pipes G G, substantially as and for the purposes herein set forth.

135,870.—*Car-Wheel.*—WILLIAM WILMINGTON, Toledo, Ohio.

The wheel is first cast with the central portion of the tire indented, which is then chilled from the outside to the flange. The tire is then cut away, which leaves only the central portion chilled, while the outside of the tread and flange remain as cast.

Claim.—A car-wheel having the portion A chilled, and the portions B and C homogeneous with the rest of the wheel.

135,871.—*Car-Coupling.*—LISTON B. WILSON, Caldwell, assignor to ISAAC A. WILSON, Zanesville, Ohio.

A bar, having a weighted crank at one end and a gate formed upon the opposite end, turns upon the draw-head, and when the gate locks the link the same is held from swinging by a spring bearing upon it. To the crank chains connect by suitable devices with the sides and top of the car, that they may be uncoupled without entering between them.

Claim.—1. The bar D, as constructed, being made longer than the spring *e*, and used in combination with the shaft *d*, as and for the purpose set forth.

2. The combination of the draw-head B B' with convex inner walls *a a*, bearing-point *x*, recess *y*, and concaved back *b*, with the sliding spring-gate C, and link G, all substantially as set forth.

135,872.—*Cultivator.*—BENJAMIN WITTER, Sherrill's Mount, Iowa.

Claim.—The beam E with round tenon at its lower end, shoulder *x*, and groove *y*, in combination with the concaved block *f* with ears *z z*, the shovel G, strap A, and bolts *t t*, all substantially as and for the purposes herein set forth.

137,873.—*Eccentric Fastening for Boxes, &c.*—WILLIAM YOUNGBLOOD, Brooklyn, N. Y., assignor to ROSABELLE YOUNGBLOOD, same place.

A disk of thin metal is pivoted at its center and has a circular groove in the face fronting the box arranged eccentrically to the pivot, so that the hook or hasp of the box-cover, which drops into it through a radial notch will be pulled down, thus forcing the cover tightly upon the box-edge.

Claim.—The disk A pivoted centrally to the box, provided with an outer flange, C, and on its under side with an eccentric groove, D, and a radial groove, E, communicating therewith, as shown and described, whereby the hook of the hasp may be let into the portion of the groove D furthest from the pivot B and the fastening completed, as set forth.

REISSUE PATENTS.

5,271.—*Railway-Car Brake.*—STEPHEN BALKWILL and WASHINGTON W. BALKWILL, Cleveland, Ohio.—Patent No. 129,890, dated July 30, 1872.

A cone is cast on the inner side of each wheel of the truck and encircled by friction-bands, which are connected by levers in such a manner that power being applied the bands are tightened and are drawn inward, the object being to prevent the wheel from slipping off the ends of the axle when the friction-bands are applied.

Claim.—1. The cones cast with the wheels and combined with friction-bands encircling the cones, and operated substantially in the manner and for the purpose set forth.

2. The employment of friction-bands adapted to be tightened on cones by being drawn inward from the wheels toward the middle of the axle, substantially as described, for the purpose specified.

5,272.—*Whip-Socket.*—SYLVESTER W. BEACH, Ypsilanti, Mich.—Patent No. 130,006, dated July 30, 1872.

A spring-jaw is hinged within the socket, by means of which the whip is held firmly in position. The socket is secured to the dash by means of a fastener, which is jointed at one end, while the open ends are secured by a screw.

Claim.—1. The jaw B, made in two parts, connected together by the spring D, and arranged, in combination with the spring C, within the socket A, substantially as shown and described, and for the purposes set forth.

2. The jaw B, in combination with the socket A, when the jaw is hinged to the socket, substantially as and for the purposes set forth.

3. The clip or fastening G, formed of the two parts *a* and *b*, constructed and hinged together as described, and provided with the nut *c* and screw A, substantially as and for the purposes herein set forth.

5,273.—*Hand-Car.*—HENRY L. BROWN, Adrian, Mich.—Patent No. 94,469, dated September 7, 1869.—Division A.

Two gear-wheels of unequal diameters are secured to the double crank-shaft, and engage with pinions of different diameters on the car-axle. A double clutch is placed on the axle between the pinions, and so arranged that the driving-shaft may be thrown in gear with either pinion, and consequently change the speed of the car at will.

Claim.—1. In a hand-car, a double crank-shaft carrying two driving-wheels of unequal size, in combination with the pinions and double clutch arranged upon the axle, substantially as set forth.

2. In a hand-car, the combination of a double crank carrying two driving-wheels of unequal size with suitable mechanism on the axle, so that the speed can be changed at will, substantially as set forth.

5,274.—*Hand-Car.*—HENRY L. BROWN, Adrian, Mich.—Patent No. 94,469, dated September 7, 1869.—Division B.

Two hand-levers are fulcrumed upon the same shaft, one of which has a short dependent arm near its center. These are connected to a double-cranked axle by connecting-rods.

Claim.—The combination of the levers *c d*, connecting-rods *e*, and double cranks, when the parts are arranged to operate substantially as described.

5,275.—*Bedstead.*—SIMON CARO, Washington, D. C.—Patent No. 134,350, dated December 31, 1872.

There are wings attached to the posts, which slide in double head and foot boards, in the center of which are vertical partitions, which serve as stops. The slats are attached alternately to the side rails and rest upon a center bar, which is fastened to the head and foot boards, and has guide-blocks for the slats. There is also a central foot to sustain the center when the bedstead is extended.

Claim.—1. The hollow head and foot boards A B, open at both ends, and provided each with a central slat or partition, *a*, in combination with the posts C C, side rails D D, and wings G G, said wings being attached to the posts and sliding in the hollow head and foot boards, substantially as and for the purposes herein set forth.

2. In combination with the head and foot boards and side rails of a bedstead, capable of extension sidewise, the slats I I, attached alternately to the side rails, and the center bar E connecting the head and foot boards and supporting the slats, and provided with guide-blocks *b b*, between which the slats move, all as and for the purposes herein set forth.

3. In combination with the posts and side rails of a bedstead, the double or hollow head and foot boards A B, wings G G attached to the posts and sliding in said head and foot boards, the vertical partition *a*, the slats I I attached alternately to the side rails and resting upon the center bar E having guide-blocks *b b*, and the central foot H, all constructed as described, and for the purposes set forth.

5,276.—*Automatic Boiler-Feeder.*—SILAS COOK, Magnolia, Iowa, assignor, by mesne assignments, to THE AUTOMATIC BOILER-FEEDER COMPANY.—Patent No. 97,361, dated November 30, 1869.

Water forced from the cistern by exhaust or live steam, which enters a valve-chamber and passes through a port opened and closed by an automatically-moving valve into the reservoir of the feeder, passes into a partitioned chamber connecting with the reservoir, and upon attaining a certain elevation in one compartment flows through an orifice in the partition into the second compartment, and by raising a float journaled therein through suitable mechanism operates three valves, one closing the port which governs entry of steam to the cistern, another opening a port which connects through a second valve-chamber with the boiler, and the third opening a port which supplies the boiler with water. Steam enters the second valve-chamber when the water is below a certain point in the boiler, passes into the float-chamber, and, by establishing an equilibrium of pressure between the latter and the boiler, permits the water to fall by gravity into the boiler. Ports are provided in both valve-chambers to permit steam trapped to enter jacket.

Claim.—1. The valve R, operating, substantially as described, to control the communication between the steam-pipe and the cistern, and also the communication between the steam-chamber of the feeder and the cistern.

2. The combination, in a boiler-feeder, of a valve, R, and a float, B', or its equivalent, operating substantially as described, to control the entrance of steam into the cistern or tank, and thus automatically regulate the supply of water to the feeder.

3. The combination, in a boiler-feeder, of the steam-chamber B, the water-chamber D, and the float-chamber Y, substantially as described.

4. The combination of the water-chamber D, chamber Z having aperture *a*, and chamber Y, to raise the valve-float B' at the time specified, and for the purpose set forth.

5. The combination, in a boiler-feeder, of a water-chamber and inclosing steam-space, and a waste-pipe for the water of condensation, said waste-pipe connecting with the water-tank or cistern, substantially as shown.

6. The combination of the steam-space B and the float-chamber Y by means of the valve V and the ports *f* and A, substantially as and for the purpose set forth.

7. The float B', operated in the manner described, in combination with the short arm J' and the weighted wheel K' having pins *r r' r'' r''' s' s''* thereon to operate the valve-gear, in the manner specified.

5,277.—*Tool-Holder for Slotting-Machines.*—JAMES S. ETTENBOROUGH, Easton, Pa.—Patent No. 134,196, dated December 24, 1872.

To an enlarged head terminating the shank of the holder is hinged a broad plate, and to the latter is swiveled an ordinary tool-post, in which the tool is clamped. Behind the plate, at the upper end, is a spring, by which the lower part of the plate—that to which the post is attached—is forced back against the head, but which, on a return stroke, will yield, and thus allow the tool to drag more lightly.

Claim.—A slotting-tool holder, consisting of a shank, A, with a grooved head, B, a relief-plate, C, pivoted to the slotted head, a spring, E, a tool-post, F, and a binding-screw, H, combined and arranged substantially as specified.

5,278.—*Gas Fire-Log.*—ALBERT H. MERSHON, Philadelphia, Pa., assignor to himself and GEORGE B. MERSHON.—Patent No. 126,473, dated May 7, 1872.

This metallic gas fire-log has a corrugated and perforated face sloping from the highest part at the rear toward the front of the grate. A water-pipe laid along the corrugations affords means for heating water or making steam.

Claim.—1. The gas-heater, constructed of a metallic body, having a face sloping or curved, as stated, in connection with perforations in and corrugations on said face, so as to form a heating-surface on the front or toward the apartment, as set forth, and for the purpose specified.

2. In combination with a gas-heater, mechanism for obtaining hot water and steam, substantially as set forth.

5,279.—*Hay and Manure Fork.*—LESTER D. PITCHER, Dixon, Ill. Patent No. 90,463, dated May 25, 1869.

The tines of the fork are made of sheet metal, swaged into a V-form to give them strength, and they are fastened to two cross-heads, to which the handle is also secured. A wire bail rises from the outer ends of the upper bar and is sprung over the arched portion of the handle, and secured thereto.

Claim.—1. Hay and manure forks consisting of sheet-metal tines *d* fitted over and supported by the cross-bar *c* and under the cross-head *b*, and having handle *a* fitted over the cross-head *b* and under the cross-bar *c*, in the manner and for the purposes substantially as herein shown and described.

2. The bail *e*, constructed with bearings e^1 e^1, shoulders e^2 e^2, standards e^4 e^4, curved portions e^5, and a back, e^6, in combination with the handle *a* and cross-head *b* of a hay and manure fork, in the manner and for the purposes shown and described.

5,280.—*Handle for Milk-Cans.*—HENRY W. SHEPARD, New York, N. Y.—Patent No. 103,933, dated June 7, 1870.

The shield is stamped out of one piece of metal, and has a curved flange extending nearly across the top of the same. The handle is formed in the usual manner, except that it is provided with a guard that extends entirely across the upper portion, and thereby increases the bearing-surface.

Claim.—1. The handle B having parallel bars B^1 B^1, so as to afford, when used in connection with any ordinary handle-plate having a groove or recess or a sheet-metal fastening or loop, a continuous bearing-bar and stop-guard, substantially as described.

2. The shield A, when the same is stamped out of one piece of metal, having a curved flange, A^2, raised center A^1 with its opening *a* and grooves C C, and the handle B with its stop-guard B^2, when the whole is so constructed and arranged as to form a milk-can handle, substantially as described.

5,281.—*Burnisher for Photographs, &c.*—EMILE R. WESTON, East Corinth, Me., assignor of one-half his interest to TIMOTHY MCDONALD.—Patent No. 131,319, dated September 10, 1872.

The paper is drawn between a feeding roll and a stationary heated burnisher, and is surfaced by friction contact with the latter.

Claim.—1. A burnishing-machine, by which a surface is given to the article to be burnished by feeding it under pressure over a stationary burnishing-tool, as specified.

2. The combination of a stationary burnishing-tool and friction feed-roll, substantially as specified.

3. The combination of the feed-roll and burnishing-tool with the pressure-screw, substantially as set forth.

5,282.—*Machine for Making Weavers' Harness.*—JOSEPH S. WINSOR, Providence, assignor, by mesne assignments, to LYMAN A. COOK, Woonsocket, and JOHN KENDRICK, Providence, R. I.—Patent No. 12,175, dated January 2, 1855; extended seven years.

The machine is for forming and tying weavers' loose-heddles of two twines by a continuous operation, which ties the two knots to form the eye and a knot at each end around the bands, the same twines forming any number of heddles in succession and all connected.

Claim.—1. The mechanism, substantially as specified, by means of which each twine is formed in a loop, and the spool or its equivalent carrying such twine carried through such loop to form a knot, and then the spool or its equivalent which carries the other twine passed through such loop, that the twine thus carried through may be griped therein when the knot is drawn tight, thus forming the eye of two twines with a knot in each griping the other twine, as herein set forth.

2. In combination with the fingers, or their equivalents on which the knots are tied, the discharger or any equivalent therefor, by means of which the knots are discharged from the said fingers.

3. The fingers located between the side bands, and operating to gage the size of the eye.

4. The fingers operating to gage the size of the eye, in combination with mechanism, substantially such as described, which operates to tighten or draw up the twine out of which the next heddle is formed.

5. The mechanism for forming the knots, substantially as herein described, in combination with pinchers, substantially as described, or any equivalent therefor, for holding the twine tight after the knots at each end of the eye have been closed, and during the operation of drawing the twines tight around the bands, as set forth.

6. The mechanism, substantially as described, by means of which the twines are wrapped around the bands in succession and formed each into a loop, through which the spool or its equivalent for carrying the twine is passed to effect the tie, substantially as described.

7. The mechanism, substantially as described, for forming what is termed the loose of the harness by reversing the motions of the spools, or their equivalents, for carrying the twines, thus carrying the twined alternately on opposite sides of one band, as set forth.

8. The combination of the sliding bar, or its equivalent, and the rods, acting together substantially as described, whereby the loose is preserved after it is formed, and the heddles drawn away from the locality where they are formed by the reception of the heddles as they are formed on the stationary slats, and the movement of the sliding bar, or its equivalent, and the band attached thereto, to which the heddles are tied in the process of formation.

9. In a heddle-making machine, the marker for designating every nineteenth or other heddle, substantially as described.

INDEX OF INVENTIONS PATENTED FEBRUARY 11, 1873.

Cooler, beer, (19,) J. Chandless 135,688
Corn husker, (59,) P. Philip 135,840
Corn husker, (59,) P. Philip 135,841
Corn sheller, hand, (59,) J. M. Hawley 135,709
Cultivator, (43,) W. T. Parker 135,736
Cultivator, (43,) W. Taylor 135,736
Cultivator, (43,) B. Witter 135,878
Cultivator, rotary, (43,) C. N. Poundstone 135,664
Derrick, (79,) Donald and Newton 135,785
Ditching machine, (114,) W. T. Hoskins 135,807
Drain, (8,) G. R. Moore 135,723
Drawer pull, (34,) C. S. and E. A. Barnard 135,754
Dress elevator, (38,) M. Fox 135,703
Earth closet, (8,) B. L. Kent 135,817
Elevator, steam water, (118,) A. D. Brock 135,765
Engine, reciprocating steam, (150,) Simpson and Gardner 135,670
Engine, rotary steam, (150,) J. F. Early 135,789
Engines, bed plate for rag or paper, (108,) G. A. Corser 135,631
Engines, valve gear for, (152,) R. McC. Fryer 135,796
Engines, cut off and reversing valve gear for, (152,) R. McC. Fryer 135,794
Engines, valve gear and connection for steam and other, (152,) R. McC. Fryer 135,795
Envelope, (146,) Kahn and Atkinson 135,819
Evener, three horse, (31,) B. W. Sutherlen 135,861
Fence, portable extension, (52,) A. W. Overholser 135,837
Fertiliser, (133,) I. M. Reames 135,846
Files, handle for, (53,) H. K. Austin 135,684
Fire kindler, (154,) M. Gernsey 135,706
Fire extinguishing apparatus, (118,) O. F. Burton 135,773
Fire arm, breech loading, (18,) C. M. Spencer 135,671
Flower stand, (63,) A. C. Dakin 135,696
Fork, hay and manure, (63,) L. D. Pitcher, (reissue) 5,279
Fruit basket, (63,) W. D. Trimler 135,737

Furnace, boiler, (149,) C. D. Williams 135,869
Furnace, puddling, (85,) E. Lloyd 135,650
Furnace, regenerator, (85,) H. Frank 135,640
Furnace grate bar, (149,) R. C. Graves 135,799
Furnace, hot air, (154,) H. L. Palmer 135,838
Furnace, metallurgic gas, (99,) H. Frank 135,639
Furnace for heating metallic bars, tubes, &c., (99,) S. P. M. Tasker 135,674
Furnaces, straw feeding attachment for, (150,) D. Morey 135,639
Gas fire log, (85,) A. H. Marshon, (reissue) 5,278
Gas, apparatus for the manufacture of coal, (66,) E. Jones 135,647
Gas from hydrocarbons, apparatus for the manufacture of, (66,) J. Rigby 135,666
Generator, sectional steam, (148,) J. B. Sweetland 135,862
Grain binder, (74,) S. D. Locke 135,826
Grain cleaning machine, (57,) G. E. Throop 135,675
Gun stock and spade, combined, (35,) W. E. Blake 135,624
Harness and saddle pad, (72,) G. Elsey 135,790
Harness saddles, back band of, (72,) S. F. Marshall 135,831
Harness, machine for making weavers', (95,) J. S. Winsor, (reissue) 5,282
Harvester, (74,) A. Rickart 135,729
Harvester, (74,) Seymour and Morgan 135,731
Harvester, (74,) T. Y. Woolford 135,741
Hatch, self-closing, (79,) C. H. Reynolds 135,728
Hay, apparatus for loading and unloading, (79,) G. W. Long 135,720
Heater and condenser, feed water, (148,) R. Berryman 135,756
Heel trimming machine, (16,) C. J. Addy 135,745
Heels, machine for burnishing, (16,) Downing and Joint 135,786
Hold back, (72,) M. D. Myers 135,833
Holder, tool, (39,) L. L. Lamb 135,715
Hooks, machine for setting button and lacing, (23,) H. C. Bradford 135,763
Hoops, machine for shaving, (40,) Douglass and Wagner 135,637
Horse's foot pad, (144,) J. Johnson 135,814
Hub and axle for vehicles, (31,) M. Chapin 135,689
Ice creeper, (16,) E. B. Colby 135,629
Iron and other metals, composition for coating, (113,) F. J. Seybold 135,668
Iron articles into steel, converting cast, (85,) R. A. Jackson 135,646
Key ring, (23,) W. T. Jenks 135,712
Knitting machine, (89,) J. Leonard 135,823
Knitting machine, weft thread, (89,) C. Callahan 135,625
Lamp, (90,) L. J. Atwood 135,749
Lamp chimney holder, (90,) H. W. Prouty 135,665
Lamp shade holder, (90,) C. E. Conrad 135,778
Land marker, (133,) J. Cuff 135,695
Lantern, (90,) S. Hughes 135,711
Lantern, signal, (90,) T. A. Davies 135,783
Leather stretching frame, (92,) C. P. Oliver 135,836
Leather, bleaching buffed sole, (92,) H. W. Cottle 135,632
Life raft, (13,) W. B. Davies 135,784
Lock, (93,) C. Bodmer 135,702
Lock, seal, (93,) Kitson and Bennor 135,818
Looms shuttle, (95,) T. Martin 135,632
Looms, shuttle box mechanism for, (95,) Atkinson and Kida 135,748
Lubricator, (67,) B. F. Cleminshaw 135,777
Magnet, reversible, (50,) J. L. Churchill 135,690
Martingale, (72,) H. R. Miller 135,657
Meat crusher, (88,) A. J. Crane 135,781
Metallic packing for piston rods, &c., (151,) F. W. Pattee 135,663
Millstone balance, (57,) G. W. Wilson 135,740
Millstone tram and level, combined, (57,) J. Hutchins 135,812
Miter box, (29,) McKinstry and Walden 135,832
Mop head, (32,) J. W. Barbour 135,753
Mop head, (32,) G. W. Wheat 135,679
Motion, converting circular into reciprocating, (67,) L. Dame 135,697
Nail cutting machine, (103,) C. W. Glidden 135,797
Nailing machines, carrier for sole, (16,) A. S. Libby 135,824
Nut lock, (14,) Thompson and Rice 135,864
Offal, apparatus for treating, (96,) J. A. Slater 135,733
Organ, reed, (106,) R. Bartlett 135,687
Paddle, revolving, (139,) J. W. McDermott 135,653
Paddle mechanism for boats, (13,) C. Howard 135,710
Paper ruling machine, (115,) E. D. Averell 135,751
Parer, apple, (88,) G. Bergner 135,622
Petroleum, &c., still for, (47,) Tait and Avis 135,673
Photographs, &c., burnisher for, (111,) E. R. Weston, (reissue) 5,281
Piano action, (119,) L. Kühner 135,820
Piano sounding board, (119,) C. F. T. Steinway 135,857
Pipe, drain, (167,) W. G. Mosk 135,721
Pipes, tool for cutting, (100,) C. E. Haynes 135,644
Pipes, securing the covers on boxes for stop cocks for water and gas service, (167,) F. H. Laforge 135,822
Planter, corn, (133,) Ingels and Mount 135,813
Planter, cotton, (133,) J. M. Brooks 135,766
Planter, seed, (133,) T. C. Garlington 135,704
Platform, dumping, (31,) J. Atkinson 135,683
Plow, (114,) J. Love 135,829
Plow, (114,) H. Selick 135,850
Plow, gang, (114,) J. K. McLennan 135,654
Plow, wheel, (114,) W. C. Grimshaw 135,800
Plows, scraper attachment for, (114,) J. P. Swofford 135,863
Press, beeter, (7,) J. Cory 135,780
Press, tobacco, (108,) D. La Du 135,648
Printing press, (117,) Bailey and Watson 135,618
Pulley, (97,) C. C. Moore 135,722
Punch, belt, (81,) A. N. Southwick 135,734
Purifier, middlings, (57,) Huntley and Holcomb 135,810
Purifying middlings, (57,) Huntley and Holcomb 135,811
Radiator, steam, (147,) R. Berryman 135,758
Radiator, steam, (147,) L. S. Daniels 135,633
Radiator, steam, (147,) E. L. Hinckley 135,645
Railroad gate, (120,) J. Beamisdarfer, Sr. 135,620
Railroad track, (120,) L. H. Peteler 135,839
Railroad track, (120,) A. D. Rock 135,667
Railroad track, (122,) J. W. Bower 135,702
Railroad rails, straightening, (125,) L. J. Todd 135,676
Railway track lifter, (73,) A. H. Arnot 135,747
Rake, harvester, (74,) J. Collins 135,691
Razor, (44,) E. A. Freeman 135,793
Register, grain, (42,) S. Ramer 135,845
Roller, road, (110,) A. Lindelof 135,825
Rope and cordage, coating and preserving, (127,) W. H. Torrey 135,865
Saccharine liquids, apparatus for treating, (155,) C. W. Durant 135,788
Sad iron, (91,) J. T. Fewkes 135,791
Saddle tree, (72,) P. Becker 135,755
Sail, rotary, (138,) J. E. Garcia 135,641
Salt, sugar, &c., evaporating pan for, (129,) L. R. Cornell 135,630
Saw set, (131,) W. Tunstill 135,867
Saws, handle for, (29,) W. Clemson 135,628
Saws, machine for gumming, (131,) C. N. Brown 135,769
Saws, machine for setting, (131,) J. G. Baker 135,752
Scissors, (44,) J. A. Correa 135,692
Scraping instrument, (88,) V. N. Davis 135,699
Screw cutting device, (14,) J. B. Low 135,830
Seed dropper, (133,) F. W. Young 135,743
Separator, grain, (150,) W. B. Allen 135,746
Sewing machine table, (134,) H. Loth 135,897
Sewing machine, book, (15,) C. H. Palmer 135,662
Sewing machine fan attachment, (134,) C. B. Veronee 135,868
Sewing machine, boot and shoe, (134,) W. Duchemin 135,767
Sewing machine needle blanks, machine for turning, (104,) J. Brooks 135,767
Shedding mechanism, (95,) W. Gminder 135,798
Sheet metal ware, machine for stamping, (136,) T. P. Austin 135,750
Show case, (54,) W. H. Reiff 135,848
Sleigh, (31,) S. Morrill 135,660
Slotting machine, tool holder for, (100,) J. S. Ettenborough, (reissue) 5,277
Sod cutter and land roller combined, (73,) C. Leavitt 135,719
Soda, apparatus, (1,) M. S. Andrews 135,617
Soldering machine, tin can, (136,) J. Redheffer 135,847
Spinning frames, drawing mechanism for, (142,) Ackroyd and Cockcroft 135,616
Spinning jacks, winding mechanism for, (142,) J. Shaw 135,852
Spool, (142,) A. Carmichel 135,626
Spools, case for exhibiting, (54,) J. D. Cutter 135,782
Steam and air brake, (122,) W. Lougbridge 135,828
Steel, manufacture of, (85,) T. Brooks 135,768
Stone, machine for cutting, (153,) A. S. Gear 135,642
Stove grate, (154,) J. R. Stone 135,735
Stove, heating, (154,) P. D. Beckwith 135,621
Straw cutter, (160,) J. F. Keller 135,816
Stud for fastening neck ties, (23,) J. A. Hard 135,803
Stump extractor, (79,) Mörchen and Doerfer 135,658
Sugar, centrifugal machine for purifying, (155,) H. Priew 135,727
Swing, (143,) E. A. Tuttle 135,738
Table, (62,) Miller and Armstrong 135,655
Thrashing machines, separator for, (159,) H. H. Kurtz 135,821
Thrashing machines, band cutter's platform for, (159,) J. A. Walsh 135,678
Toy, automatic, (143,) A. W. Browne 135,770
Toy velocipede, (143,) W. Sellers 135,851
Trap, animal, (143,) E. A. C. Da Silva 135,732
Tree protector, (63,) C. Ayers 135,685
Truss, (156,) C. H. Eggleston 135,638
Umbrella runner, (165,) S. Wales 135,677
Valve, safety, (152,) H. Davies 135,698
Vehicle wheel, (31,) A. L. Blackman 135,623
Vehicle wheel, (31,) J. F. and W. Downing 135,701
Vessel, sheet metal, (136,) H. W. Shepard 135,853
Wagon body, (31,) N. B. Cooper 135,779
Wagon coupling, (31,) U. Wynn 135,748
Warping machine, (17,) J. B. Bancroft 135,619
Washer, metallic, (14,) M. G. Hubbard 135,809
Washing machine, (91,) F. W. Hewson 135,805
Washing machine, (91,) E. Hoyt 135,808
Washing machine, (91,) J. Strahl 135,859
Water wheel, turbine, (168,) W. P. Hale 135,707
Weather strip, (30,) I. Case 135,627
Well, driven, (51,) J. Large 135,718
Whip socket, (72,) S. W. Beach, (reissue) 5,272
Windmill, (118,) G. Shaver 135,669
Window shade, (62,) E. E. Johnson 135,713
Wrench, (100,) N. L. Post 135,842
Wrench, (100,) J. Smiley 135,856
Wrench, pipe, (100,) W. H. Burton 135,773

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 11, 1873.

Abbott, Hammond, and Adler 135,802
Ackroyd, R., and W. Cockcroft, Drawing machine for spinning frames 135,616
Adams, C. W., Tag buckle for harness 135,744
Addy, C. J., Heel trimming machine 135,745

Adler, Abbott, and Hammond 135,802
Allen, W. B., Grain separator 135,748
Althof, Bergman & Co., assignees 135,770
Andrews, M. S., Soda apparatus 135,617
Armour, J. B., assignee 135,634, 135,635
Armstrong and Miller 135,655
Arnot, A. H., Railway track lifter 135,747
Atkinson, J., Dumping platform 135,683
Atkinson, W., and C. C. Klein, Shuttle box mechanism for looms 135,748
Atkinson and Kahn 135,819
Atwood, L. J., Lamp 135,749
Austin, H. K., Handle for files 135,684
Austin, T. P., Machine for stamping sheet metal ware 135,750
Automatic Boiler Feeder Company, assignee, (reissue) 5,276
Averell, E. D., Paper ruling machine 135,751
Avis and Tait 135,673
Ayers, C., Tree protector 135,685
Bailey, F. L., and J. Watson, Printing press 135,618
Baker, J. G., Machine for setting saws 135,752
Balkwill, S. and W. W., Railway car brake, (reissue) 5,271
Bancroft, J. B., Warping machine 135,619
Barbour, J. W., Mop head 135,753
Barnard, C. S. and E. A., Drawer pull 135,754
Beach, S. W., Whip socket, (reissue) 5,272
Beamisdarfer, J., Sr., Railroad gate 135,620
Beattie, J. H. B., assignee 135,804
Becker, P., Saddle tree 135,755
Beckwith, P. D., Heating stove 135,621
Bennor and Kitson 135,818
Bergner, G., Apple parer 135,622
Berryman, R., Feed water and condenser 135,756
Berryman, R., Feed water apparatus for steam boilers 135,757
Berryman, R., Steam radiator 135,758
Bigelow, G. B., trustee, assignee 135,787
Bigler, C. S., Car coupling 135,686
Blackman, A. L., Vehicle wheel 135,623
Blake, W. E., Combined gun stock and spade 135,624
Bodmer, C., Lock 135,702
Bolleau, E., Fire plate for steam boilers 135,759
Bolleau Patent Stove and Furnace Fire Plate Company, assignee 135,759
Bonnell J. C., Blank book 135,760
Bonzano, Griffen and Clarke 135,776
Borton, J., and W. H. Hartley, Churn 135,761
Bower, J. W., Railroad truck 135,702
Bradford, H. C., Machine for setting button and lacing hooks 135,763
Bradley and Hubbard, assignees 135,860
Britton, R. G., Child's carriage 135,764
Brock, A. D., Steam water elevator 135,765
Brooks, J., Machine for turning sewing machine needle blanks 135,767
Brooks, J. M., Cotton planter 135,766
Brooks, J. W., trustee, assignee 135,797
Brooks, T., Manufacture of steel 135,768
Brown, C. N., Machine for gumming saws 135,769
Brown, H. L., Hand car, (reissue) 5,273
Brown, H. L., Hand car, (reissue) 5,274
Browne, A. W., Automatic toy 135,770
Brundred, W. J., assignee 135,717
Brydges and Owen 135,661
Burdett, R., Reed organ 135,687
Burton, J., Carriage painter's stand 135,771
Burton, O. F., Apparatus for extinguishing fires 135,772
Button, W. H., Pipe wrench 135,773
Callahan, C., Weft thread knitting machine 135,625
Cameron, E. G., Bed bottom 135,774
Carmichel, A., Spool 135,626
Caro, S., Bedstead, (reissue) 5,275
Carr, G. W., assignee 135,818
Case, I., Weather strip 135,627
Chandless, J., Beer cooler 135,688
Chaplin, M., Hub and axle for vehicles 135,689
Chapin, W. J., Car coupling 135,775
Charles, L., assignee 135,646
Chipman, A., assignee 135,663
Churchill, J. L., Reversible magnet 135,690
Clarke, T. C., A. Bonzano and J. Griffen, Pivot bridge 135,776
Clarke, Reeves & Co., assignees 135,776
Cleminshaw, B. F., Lubricator 135,777
Clemson, W., Handle for saws 135,628
Cockcroft and Ackroyd 135,616
Colby, E. B., Ice creeper 135,629
Collamer, T., assignee 135,753
Collins, J., Harvester rake 135,691
Conrad, E. E., Lamp shade holder 135,778
Cook, L. A., assignee, (reissue) 5,282
Cook, S., Automatic boiler feeder, (reissue) 5,276
Cooper, N. B., Wagon body 135,779
Cornell, L. R., Evaporating pan for salt, sugar, &c 135,630
Correa, J. A., Scissors 135,692
Corser, G. A., Bed plate for rag or paper engine 135,631
Cory, J., Boring machine 135,693
Cory, J., Beater press 135,780
Cote, L., Machine for trimming and burnishing boot and shoe soles 135,694
Cottle, H. W., Bleaching buffed sole leather 135,632
Cranmer, W. C., assignee 135,791
Crane, A. J., Meat crusher 135,781
Crosby, L. M., assignee 135,774
Cuff, J., Land marker 135,695
Cutter, J. D., Case for exhibiting spools 135,783
Dakin, A. C., Flower stand 135,696
Dame, L., Converting circular into reciprocating motion 135,697
Daniels, L. S., Steam radiator 135,633
Da Silva, E. A. C., Animal trap 135,732
Davies, H., Safety valve 135,698
Davies, T. A., Signal lantern 135,783
Davies, W. B., Life raft 135,784
Davis, V. N., Scraping instrument 135,699
Dederick, P. K., Bale tie 135,709
Deibert, Royal and Lentz 135,849
Downs, J., assignee 135,636
Dillon, M., Brush machine 135,634
Dillon, M., Paint brush 135,635
Diss and Kennedy 135,714
Dixon, A. H., Show card 135,636
Doerfer and Mörchen 135,658
Donald, F., and G. S., Newton, Derrick 135,785
Douglass, J. A., and J. Wagner, Machine for shaving hoops 135,637
Downing, E. H., and W. Joint, Machine for burnishing heels 135,786
Downing, J. F. and W., Vehicle wheel 135,701
Duchemin, W., Boot and shoe sewing machine 135,787
Duenz, E. and J. A., assignees 135,702
Durant, C. W., Apparatus for treating saccharine liquids 135,788
Early, J. F., Rotary steam engine 135,639
Eggleston, C. H., Truss 135,638
Elsey, G., Harness and saddle pad 135,790
Enterprise Manufacturing Company of Pennsylvania, assignee 135,752
Ettenborough, J. S., Tool holder for slotting machine, (reissue) 5,277
Fewkes, J. T., sad iron 135,791
Folsom, J. E., assignee 135,745
Fox, M., Dress elevator 135,703
Frank, H., Metallurgic gas furnace 135,639
Frank, H., Regenerator furnace 135,640
Franklin, G., Car spring 135,792
Freeman, E. A., Razor 135,793
Fryer, R. McC., Cut off and reversing valve gear for engines 135,794
Fryer, R. McC., Valve gear and connection for steam and other engines 135,795
Fryer, R. McC., Valve gear for engines 135,796
Garcia J. E., Rotary sail 135,641
Gardner, L., 2d, assignee 135,644
Gardner and Simpson 135,670
Garlington, T. C., Seed planter 135,704
Gates, J., Bridge 135,705
Gear, A. S., Machine for cutting stone 135,642
Gernsey, M., Fire kindler 135,706
Gillette and Prosser 135,843
Glidden, C. W., Nail cutting machine 135,797
Gminder, W., Shedding mechanism 135,798
Graves, R. C., Furnace grate bar 135,799
Griffin, Clarke and Bonzano 135,776
Grimshaw, W. C., Wheel plow 135,800
Hale, W. P., Turbine water wheel 135,707
Hall, J. H., Bustle 135,801
Hammond, D., M. Adler, and J. Abbott, Iron bridge 135,802
Hankey, A., assignee 135,631
Hard, J. A., Stud for fastening neck ties 135,803
Harlow, J. B., Sofa bedstead 135,643
Hart, R. B., Wash boiler attachment 135,709
Hartley and Borton 135,761
Hawley, J. M., Hand corn sheller 135,709
Haynes, C. E., Tool for cutting pipes 135,644
Hemenway, C. V., Cloth measure 135,804

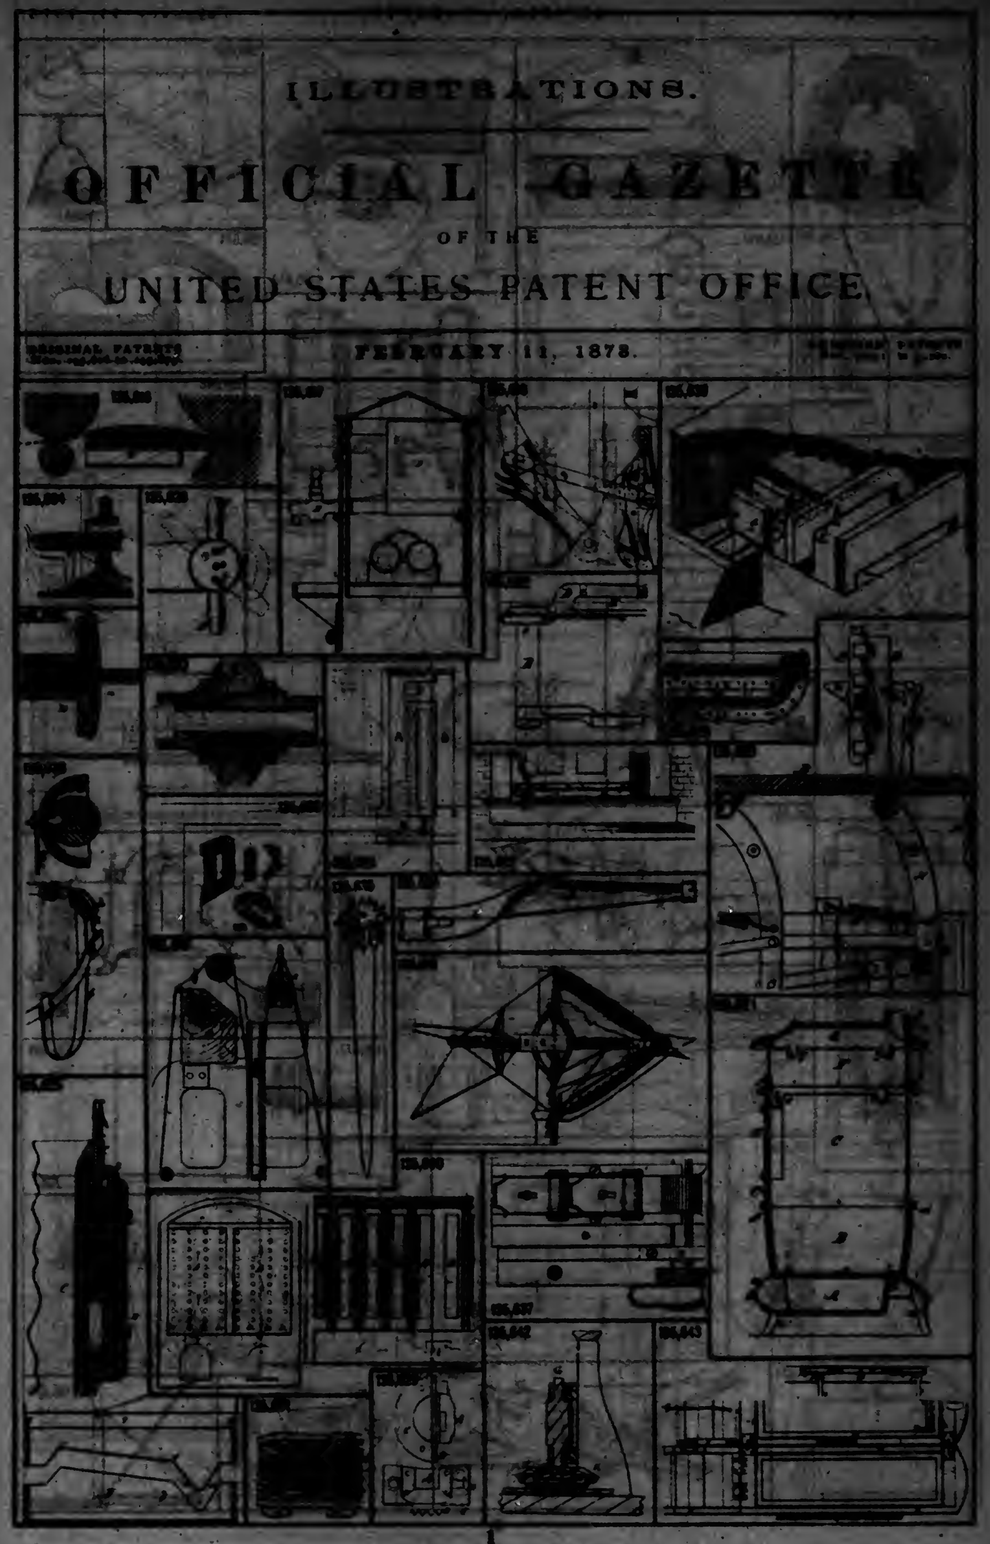
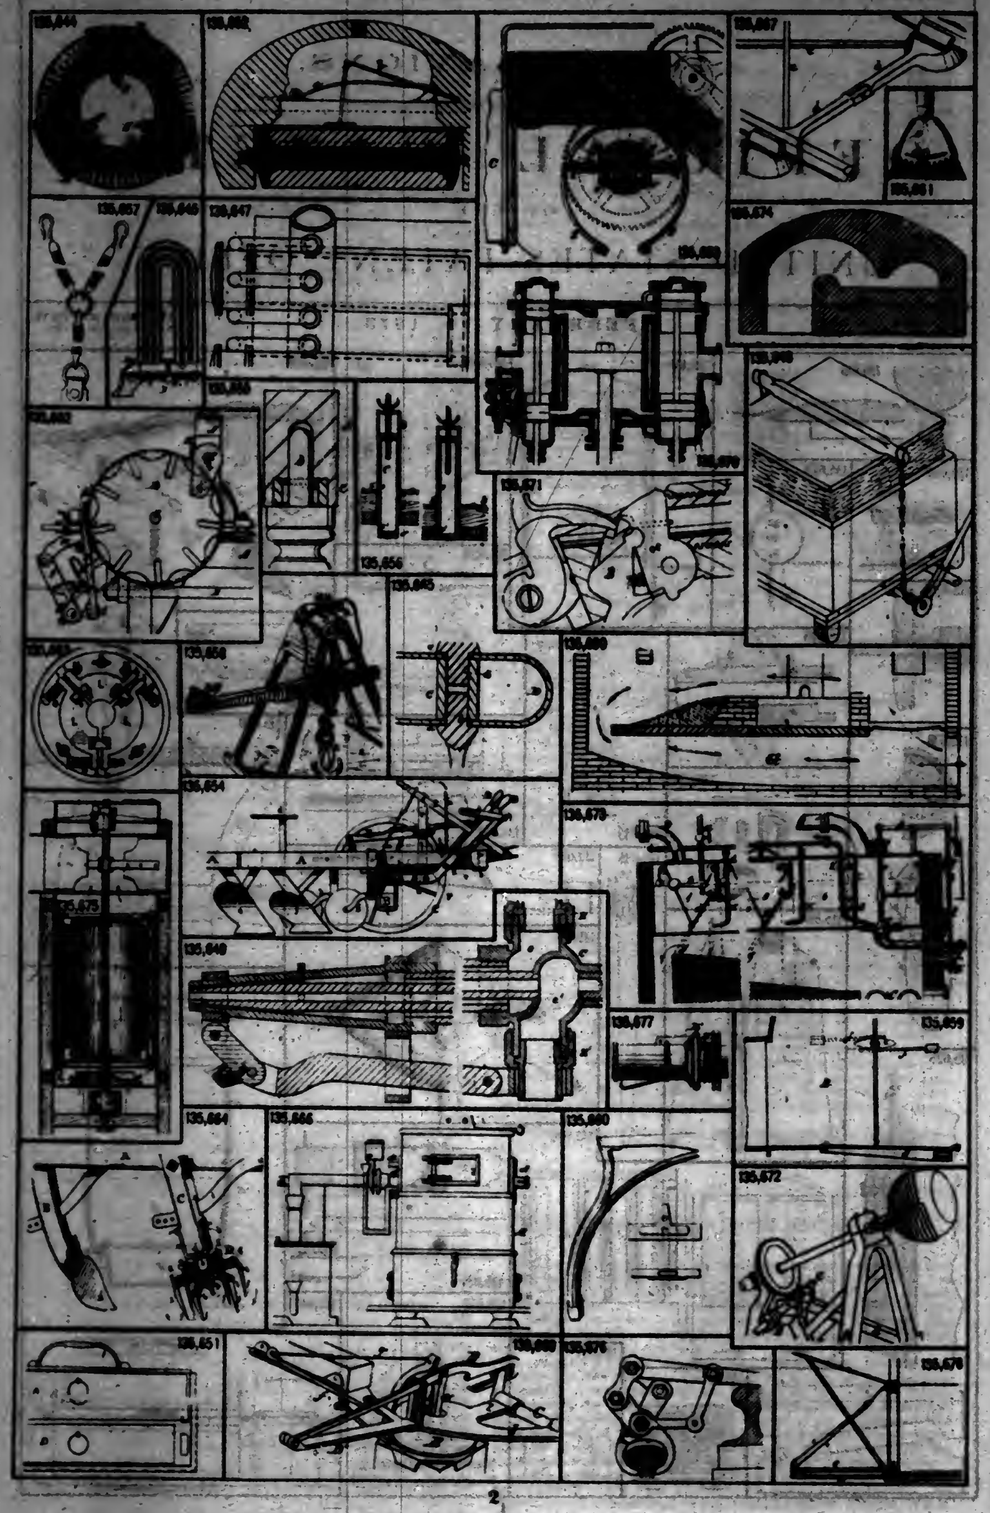
TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.



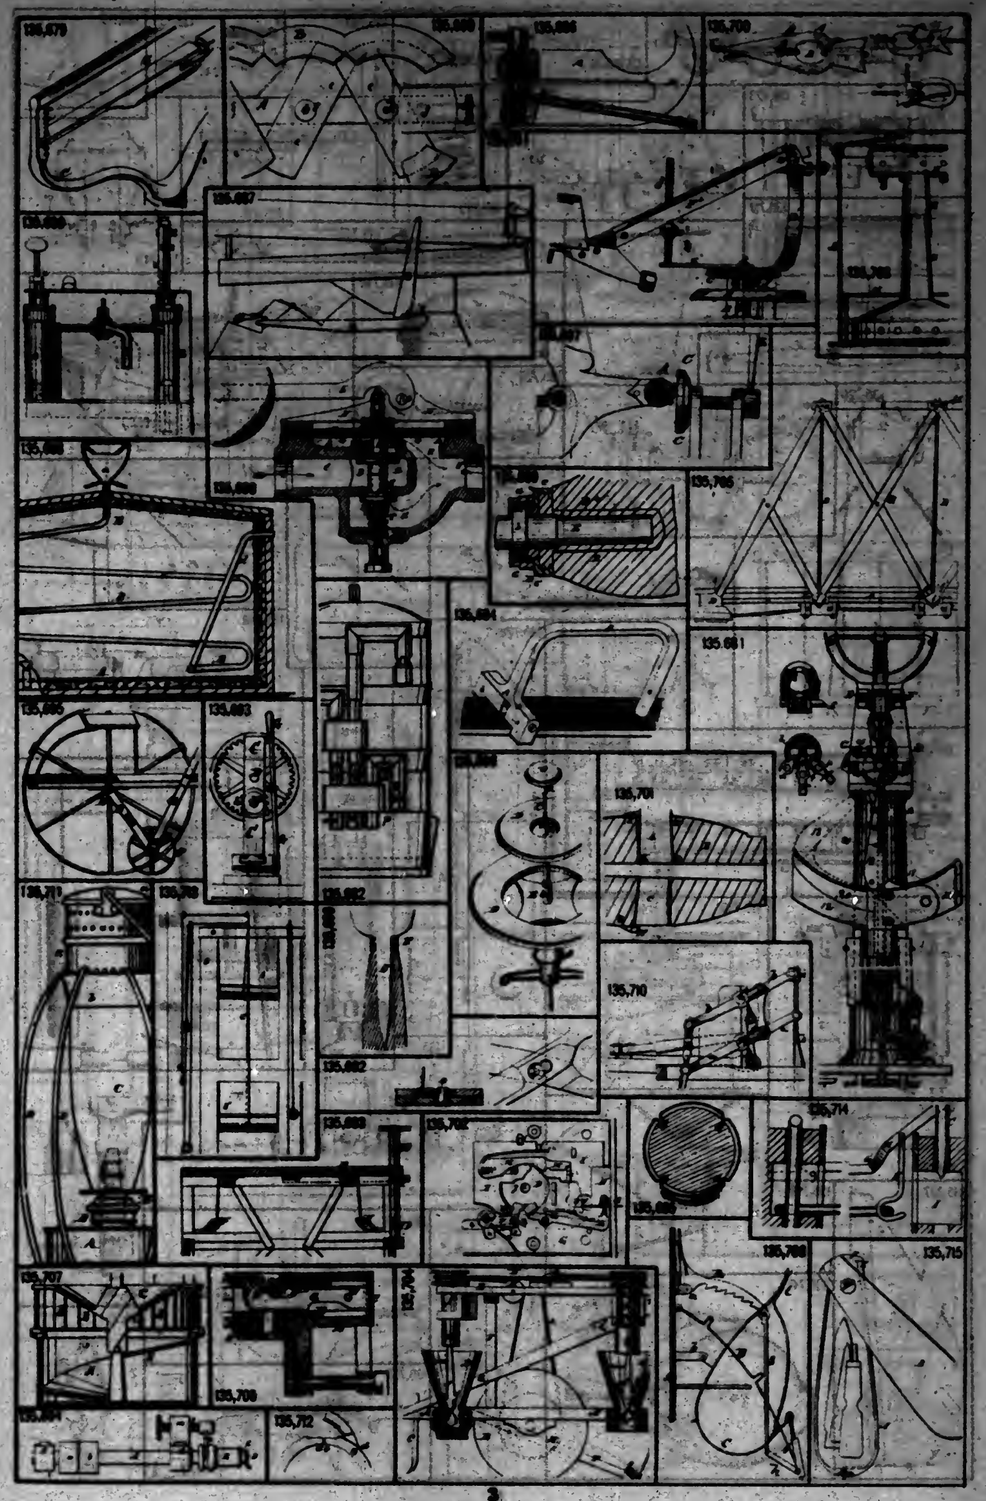
The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.



Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.



Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

WM. C. DODGE.—*Appeal.*

[*Appeal from the Primary Examiner in the matter of the application of William C. Dodge for patent for* HINGES.—*Decided August* 30, 1872.]

All necessary amendments of an application should be completed before the claims are passed upon, but if not then made, as, for instance, when new claims are recommended by the Examiners-in-Chief, they should be required whenever the occasion for them appears.

No amendments should be allowed in original applications which change the character of the invention essentially.

Amendments may be made although more than two years have elapsed after the application was filed; there is no limit as to the time.

Claims filed after an appeal to the Examiners-in-Chief can be considered only when sanctioned by the Commissioner.

It is the duty of the Examiners-in-Chief to call attention to whatever they deem important to the Office or the applicant, although their suggestions are not authoritative.

LEGGETT, *Commissioner:*

This application has been appealed to the Board, and the decision of the Examiner overruled and two amended claims allowed. The Examiner now requires the specification to be restricted so as to conform, according to his judgment, with the claims. He also makes objection to the introduction of a figure of the drawing, and descriptive matter referring thereto, more than two years after the date of filing the application, because they present "new matter," viz., *sets* of three hinges instead of pairs, which are all that were shown during the first two years of the pending of the application in the Office.

It is proper for the Examiner to see that the specification is made to correspond with the claims in all cases. This should be done before passing upon the merits of the claims in the first instance. But if neglected then, as it ought never to be, it should be done afterward. It has happened that the Board have had to remand applications for this purpose to an Examiner, and even, the Board having failed to do this, that the Commissioner has been obliged to do it. The general rule, however, is that where the jurisdiction of the higher tribunal begins, that of the Examiner ends. But when claims are suggested as allowable by the Board which were not appealed from the Primary Examiner, and which have not been submitted to his scrutiny, it becomes his duty, if their incorporation into the case has been authorized, to see that the statement of the invention corresponds with them before considering them upon their merits. This was the duty of the Examiner in the present instance. But the rule is always to be observed that only the Commissioner in person can authorize the consideration of any claim not appealed from the Examiner. The authority of the Board extends to passing upon the merits of claims merely as they come from him. It is proper also for them to make suggestions of alterations in either the specifications or claims, or with reference to other matters which may appear to them to be of importance, either to the Office or to the applicant, and they would be derelict if they did not; but such suggestions have no binding force. They are to be considered but not necessarily adopted by the Examiner. In this case I think the Examiner errs in his requirements. I do not see, upon a careful reading, that the lines he requires to be stricken out are really any broader in their scope than the claims allowed by the Board. It is a fact that applicant's pintles are and must be of unequal lengths, and he does not say that making them so is his invention. He merely says that he makes them so in securing the objects of his invention, and so they are specified in the claim.

As to the objection that "new matter cannot be in-

troduced two years, more or less, after a case is filed," I am unable to quite understand it as put or to see any force in it. The words "more or less" render it rather indefinite. But assuming it was meant to be said *more than two years* after an application is filed, I am not aware of any valid rule of practice of the nature indicated. The rule is that amendments should never be admitted in original applications to essentially change the character of the invention first presented for patent—that is, to make it another and a different thing—but there is no rule which excludes the filing of any amendment more than two years after the filing of an application that would ever be admissible at all. There is no limit of time restricting amendments except that provided in the statute defining abandonment, and that has no relation to the character of the amendment or other matter presented. There is no other restriction of "new matter" as to pending applications than that above stated. As to reissues where the question of new matter, as known in the practice of the Office, exclusively belongs, no new matter whatever should be admitted. They are *sui generis*, however, and form no rule for the treatment of original applications either directly or by analogy.

The objections of the Examiner are not sustained.

J. W. EVANS, E. T. BUSSELL, RICHARD VOSE.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the applications of J. W. Evans, E. T. Bussell, and Richard Vose for reissue of their respective patents for* IMPROVEMENT IN CAR-SPRINGS.—*Decided February* 24, 1873.]

A case in which, of three interfering parties, one having filed no preliminary statement and submitted no testimony, is virtually out of the case, his original application being subsequent to the dates of the other two.

A question as to what is *new matter* in an application for reissue must be determined from the original patent.

A mere reference in a specification to the possibility of making a column of rubber *hollow*, that construction being shown in neither the drawing nor model, will not justify a claim to the hollow feature in a reissue specification.

A claim being distinctly to an *exteriorly-grooved* column, a *plain ungrooved* construction being nowhere suggested, the latter feature cannot be properly introduced into a reissue specification so as to interfere with a claim by another party to a construction in which the ungrooved feature occurs.

Interference dissolved, as the collision is only owing to the unwarrantable breadth of statement of the two (remaining) parties, the cause of conflict disappearing when their statements are restricted to their legitimate proportions.

LEGGETT, *Commissioner:*

Evans filed his original application July 23, 1868, and a patent was granted him September 22, 1868. His application for reissue was filed December 20, 1871. He has filed no preliminary statement and submitted no testimony. He is therefore virtually out of the controversy, his original application having been filed subsequent to those of the other parties.

The original application of Bussell was filed February 7, 1868, and his patent issued November 24, 1868. It was reissued February 27, 1872, No. 4,767, and the present application is for a reissue of that reissued patent.

Vose's original application was filed March 24, 1865, and his patent, of which he now seeks a reissue, was granted December 5, 1865. Priority is *prima facie* with Vose, and the burden of proof is upon Bussell.

The alleged invention in controversy consists of a hollow rubber column surrounded by a metallic spiral spring. The circumstances under which it is claimed are unusual. In Vose's original patent he showed a peculiar combination of a solid spirally grooved column surrounded by a coiled spring, the two peculiarly united into one spring. The grooves of the column were between the coils of the spring to allow of suitable play of the latter, and a projecting rubber fin extended between the coils to prevent their contact by compression; or else the groove was to be formed large enough to receive the spring without embracing it closely, the threads defining the grooves projecting between the coils of the spring as a packing. This was a special construction of the column to which the subject-matter of this controversy is not limited. There is in Vose's original patent nowhere any suggestion of the combination of *a plain hollow rubber cylinder* and a surrounding coiled spring. The following words, however, referring to his grooved column, occur in the specification of his patent. "Although the central core or column of rubber may be used solid, I prefer to have a central aperture pierced longitudinally through the same." Unfortunately the central aperture is not shown in either his model or drawing, and therefore he is precluded by the 27th, 29th, and 53d sections of the patent act from claiming a hollow column, even of the peculiar grooved exterior construction he sets forth, in combination with an exterior metallic spring.

Whatever relates to the subject-matter of a plain ungrooved hollow column combined with an exterior spiral spring, should have been eliminated as new matter, and must be now. From the foregoing it is obvious that there is in fact no interference between these applications. The subject-matter claimed by Bussell is not a groove, but a plain hollow rubber column surrounded by a spiral spring. Vose does not hint at such a device at all. He is limited by his patent wholly to a grooved column peculiarly combined with a spring, and when he says, as above quoted, that he prefers to make the grooved column hollow, he is not to be understood as including also an ungrooved column. There is no ground in his patent anywhere to base a claim such as has been made and withdrawn by Vose, and such as is presented by Bussell. This interference will accordingly be dissolved. Bussell's application, however, requires some consideration. His claim is—

"The combination of a hollow vulcanized rubber cylinder or column with an external metallic spiral spring, substantially as herein shown and described."

It appears that the Examiner objected, very naturally, to this claim as covering new matter, and an appeal was taken to the Acting Commissioner, who permitted it to stand, without prejudice, to a motion for dissolution of interference, for the purpose, merely, of seeing what light the testimony elicited by the interference would throw upon it. I do not think it ought to stand, no matter what evidence might appear, because the question as to what is new matter is to be determined from an inspection of the original patent. I can find no warrant for this claim in the original patent. The first claim of the reissued patent is as wide a departure from the original subject-matter as can possibly be sanctioned. The original patent does not justify the claim now made, and the Examiner is commended to his original objection. In both these cases the remedy by reissue is palpably sought to be abused.

PATTEE *vs.* RUSSELL.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the reissue application of Lewis C. Pattee and the patent of Titus H. Russell for* IMPROVEMENT IN SAW-MILL CARRIAGES, *granted December* 5, 1871.—*Decided February* 20, 1873.]

An inventor who has fully shown his improvement in a model, but takes no further steps toward reducing it to practice for five years, and does not apply for a patent for more than a year after he learns that another has put it in practice before him, forfeits his right to a patent, and the latter will be held the prior inventor.

The title of the latter is not prejudiced because the other filed his application three weeks before him.

THACHER, *Acting Commissioner:*

The facts which I think may be considered in proof in this case, from a just balance of all the testimony, are as follows: Russell made a model in 1865 which illustrates the invention, and laid it aside until February, 1871, when he put the invention in practical operation in a mill, and he filed his application for patent August 21, 1871. He also made another model in 1867, but this constituted no advance toward giving the public the benefit of the invention, and may be regarded as an immaterial fact.

Pattee completed his invention in 1870, put it in practical operation during that year in a lumber-mill, (where it was examined by Russell,) and applied for his patent September 12, 1871, twenty-two days subsequent to Russell's application.

Upon these facts the Examiner of Interferences and the Board of Appeals have found that priority of invention is with Pattee, by authority of the law as laid down in *Ransom* vs. *The Mayor of New York*, 1 Fish, 272, and other cases in which a like doctrine has been announced.

"If the plaintiffs, after they had perfected their invention, unreasonably delayed their application for a patent, and other persons, before such application was made, actually perfected and applied the same invention to practical use, and gave the knowledge thereof to the public, and the plaintiffs, after the knowledge of such subsequent invention or discovery and its public use, failed to make objection and to apply without unreasonable delay for a patent for their invention, they cannot sustain their patent." (*Ransom* vs. *Mayor of New York.*)

There is no doubt but this is the law and that it governs the *grant* as well as the *validity* of patents. The only question is whether it applies to the state of facts in proof in this case. Here on the part of Russell, if the testimony he adduces is to be believed, is an invention completed and reduced to form in a working model, which clearly illustrates it, in 1865. He is engaged in business that affords every opportunity and offers every inducement to him to reduce it to practice and give the public the benefit of it; yet he suppresses it for a number of years, until finally he sees it constructed and put in public use by an independent inventor. He examines it carefully, inquires as to its efficiency, and for the first time appears to appreciate it, but still does not assert any right in it. During this period of delay it is shown that he was paid over seven thousand dollars in money, and no obstacle appears to have precluded him from seeking a patent or otherwise giving the public the benefit of his invention. To be sure, it appears that he ultimately preceded Pattee by a few days in his application for a patent, but it was more than a year after he was cognizant of the manufacture of the machinery for Pattee, and nearly a year after he had seen and examined it in public use in Pattee's mill. The fact that he was first in the Office by a few days should therefore have very little weight. In view of the preceding delay of several years, which is a circumstance of some importance, and his failure in fact "to give the public that consideration for the grant of exclusive privileges upon which all valid patents must be based," viz., knowledge of the invention, I think there was unreasonable delay after his knowledge of what Pattee had done.

Pattee, therefore, has been correctly held, upon the facts in proof, to be, in contemplation of law, the prior inventor. The decision of the Board is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—NORTHERN DISTRICT OF NEW YORK.

WILLIAM A. KIRBY *et al. vs.* THE DODGE AND STEPHENSON MANUFACTURING CO. *et al.*

[*In Equity.—Before Woodruff, Circuit Judge.*]

Byron Densmore's patent of February 10, 1852, described a harvester having but one wheel in a frame hinged to the frame which carried the cutter-bar, but rigidly attached to it by bolts, though capable of adjustment at different heights: *Held*, that a reissue of it with the following claim was void: "Hanging the driving-wheel in a supplemental frame which is hinged at one end to the main frame, while its opposite end may be adjusted and secured at various heights, or be left free, as desired, whereby the cutting apparatus may be held at any desired height for reaping, or be left free to accommodate itself to the undulations of the ground for mowing;" both because the original application contained no indication of the change which rendered the machine capable of mowing, although it consisted merely in removing the bolts by which the height of the wheel-frame was adjusted and secured, and also because the alteration was never devised till after the original patent was issued.

If the reissued claim is interpreted to embrace all means by which a cutter may be suspended for reaping, or allowed to follow the undulations of the ground for mowing, it is too broad, and therefore invalid.

If it is construed to embrace a frame carrying the cutter-bar and hinged to the wheel-frame, it is also void for want of novelty, a similar alteration for the same purpose having been practiced before in McCormick's reaper to as great an extent as in Densmore's.

If it embraces the specific arrangement of the two frames in the position and mode of operation described, the defendants' machine is no infringement, as it has no second or supplemental frame, but instead thereof, what is not its equivalent, a drag-bar by which the cutter-bar is sustained against the pressure of the crop, and its height is adjusted and secured by chains, by which it is suspended.

The decision of the United States Supreme Court upon a question of law arising upon the same facts, and sustaining a patent, is entitled to deference, but not where the facts appear different, as in this instance.

[*David Wright*, of Auburn, for complainants.
George Harding, for defendants.]

WOODRUFF, *Circuit Judge:*

The complainants herein complain that the defendants have infringed and are infringing their rights as assignees of a certain patent granted to Byron Dens-

more, on the 10th of February, 1852, for a new and useful improvement in grain-harvesters, surrendered and reissued to the complainants January 28, 1862, and thereafter, on the 30th of January, 1866, extended for the term of seven years from the expiration of the first term, viz, from the 10th of February, 1866.

The defendants deny that Byron Densmore was the first inventor of the improvement described in the reissued letters patent, and aver that such reissue was fraudulently and illegally granted, and was obtained in order to include, and does include, things not invented by Densmore, and not intended to be patented by him, and such reissued letters patent are for a different invention from that originally patented, and are invalid and void.

They also allege that the improvement described in the reissued patent had, prior to February 10, 1852, been invented, and was known and used by other persons who are named in the answer. That it was described in certain letters patent also mentioned.

They also deny that they have made or sold any machines whatever containing the said alleged invention of the said Densmore, as set forth in the specification and specified in either of the claims of said reissued patent, and deny that they have in any manner whatsoever infringed the said letters patent.

The infringement alleged relates solely to the first claim in the reissued patent granted to the complainants. "The nature and principle of the invention" included in that claim are declared in the specification to relate "to the construction and combination of two frames, the one for supporting the driving-wheel and the other for supporting the cutting apparatus, and hinging the said frames together in such a manner that the driving-wheel and cutting apparatus may each follow the inequalities of the ground independently of the other, and also that they may be bolted rigidly together for supporting the cutting apparatus at any desired height."

The claim with which the patentees conclude their description of the construction and mode of operation of the improved machine is as follows:

"Hanging the driving-wheel in a supplemental frame or its equivalent, which is hinged at one end to the main frame, while its opposite end may be adjusted and secured at various heights, or be left free as desired, whereby the cutting apparatus may be held at any desired height for reaping, or be left free to accommodate itself to the undulations of the ground for mowing, substantially as described."

Prior to Densmore's alleged invention reaping-machines had been made by McCormick, and others, consisting of a large wheel bearing on the ground, surrounded by a rectangular frame, in the sides of which the axle of the wheel turned, and at the end of which the platform and cutting apparatus were attached, the cutting apparatus extending sidewise from this frame to the distance or width of the swath of grain proposed to be cut. Gearing was connected with the ground-wheel and operated by its revolution, when drawn over the ground, upon arms, swivels, and rods, which moved the cutters and severed the grain, which, when severed, fell upon the platform and was raked off into gavels. As a machine so constructed was liable to tilt sidewise, and, under the weight of the platform and cutters projecting sidewise, must necessarily tilt sidewise, a small wheel was also placed at the outer end of the platform and cutter-bar, which sustained the cutters, and if the ground was level also sustained the frame, to the end of which the platform was attached, and in which frame the axle of the main wheel was placed, and so prevented the tilting or upsetting of the machine. This involved, also, another necessity in the construction, viz.: The platform and cutters must be rigidly attached to the frame, else the smaller wheel at the outer end could not operate to support the frame or the wheel moving therein, and prevent the tilting referred to. There were perhaps other reasons why the platform must, in such a machine, be attached with great firmness and strength, but it is sufficient for my present purpose to make the general construction of the machine intelligible. Densmore had seen one of McCormick's machines in which, in order to raise or lower the cutters, there were two or more holes in the side pieces of the frame, in either of which the axle of the main wheel could be placed, and, by the change, the height of the cutters from the ground would be varied. Densmore, instead of relying upon such holes for inserting the axle in the side pieces of the frame, which must, I think, have been inconvenient to change, made a model in which he inserted uprights with long curved tenons, in mortises in the sides of the frame at the place of the axle of the wheel, and inserted the axle of the wheel therein, and so by raising those uprights in the mortises and depressing them at pleasure, a similar effect to raise or lower the cutters was produced. In view of this change of construction, as well as other devices, Densmore, on the 3d of June, 1849, filed a caveat in the Patent Office.

Long prior to this McCormick made numerous machines wherein the cutters could be raised and lowered so as to cut at different heights, by another device, which will be hereafter noticed.

Densmore, however, took out no patent for the machine as described in his caveat. He made a model in which he placed a second rectangular frame upon the other, of somewhat less length; near the middle of this he placed the axle of the main wheel with the gearing connected therewith. Obviously such additional frame, when lying flat upon the upper surface of the other, amounted simply to giving the side pieces of the latter greater width, but for facility in raising or depressing the cutters by lowering the frame to which they were attached he attached one end of the upper frame to the lower frame by a hinge, so that (acting on the axle of the wheel as a fulcrum) by raising and lowering the other end of it he lowered and raised that other beneath the axle of the wheel, producing the precise effect before caused by raising and lowering the long-tenoned uprights into and from the mortises before mentioned; and at the forward end of the upper frame he set in the lower frame uprights to which that forward end was bolted at any desired elevation by bolts, easily removed and inserted in holes higher or lower in the uprights, at pleasure. It was this machine, imperfectly described, perhaps, but this in substance that was shown in the model and drawings when he took out his patent in 1852.

In these descriptions I of course omit notice of devices for raking and reeling and for adjusting the outer or platform wheel, because they are not material to any question now in issue.

McCormick had, as early as 1835, employed the other device (above alluded to) for raising and lowering the cutters so as to cut at different heights. He placed his main wheel, with the gearing connected therewith, in one frame, and the platform and cutters were fastened to another frame, the sides of which were not laid upon nor placed beneath the other, but ran along the sides parallel therewith so as to embrace the rear ends thereof. The sides of both of the frames were attached by a bolt passing through them as a pivot or hinge, so that the cutter-frame turning on that pivot could be raised or lowered at pleasure. At the forward ends of the arms of the cutter-frame three holes were made in the wheel-frame, at different heights, through which to bolt the cutter-frame and fix it in the several positions which raising or lowering the cutters required, and it was entirely practicable by withdrawing the last-mentioned bolt to permit the platform and cutter, or rather the ends of the supporting cutter-frame, to rest upon the ground. Whether, when so resting on the ground, the machine was a practical machine, useful for mowing, it may be material hereafter to consider; for the present I describe the machine.

Passing by what is claimed by the defendants to have been done by others, and omitting to further describe the state of the art, I have mentioned what had been done by McCormick before 1852, and what Densmore did prior to the granting of his original patent of February 10, of that year. He then received his patent, and it is of some significance that in his specification he in no wise claims that shifting the position of the axle of the main wheel relatively to the height of the cutter-frame is new, nor that placing the main wheel in one frame and the cutter or platform and cutter on another is new, or that hinging the cutter-frame and the wheel-frame together, so as by the action on the hinge to effect the raising or lowering of the cutter, is new. Obviously, with McCormick's machine before him, he could not broadly claim either of these. The utmost he could claim, if anything, on these several points, was the particular device by which these operations were performed, in so far as it differed substantially from McCormick's. Possibly the placing one frame above another to be operated in the manner I have attempted to describe, and as shown in his drawings and model, was patentable. But in fact he made no claim even to this; his claims were confined solely to other devices to assist in raking the grain and supporting the blades of the cutters. He does state that his *arrangement* for *raising* and *lowering* the machine, to vary the height of the cut, is new, and that is entirely consistent with what is above stated. McCormick's arrangement of the parts employed in this operation was not identical with his. In function and effect and mode of operation they did not differ, but in arrangement or relative position they were unlike.

I mention this omission to claim anything in respect to using two frames, or hinging one frame to the other, not because a patentee may not claim in a reissue what, through mistake or inadvertence, he did not claim in his original patent, but because it is evidence, when the novelty of the device is in dispute, that Densmore, when he took out his patent, was aware of what McCormick had done before him, and was conscious that he could not claim to be the first inventor, or certainly not of anything more than the special arrangement or relative position of the parts.

The foregoing explanations will, I think, make the consideration of the questions below stated intelligible. First, whether the reissued patent, if construed so as to embrace anything except the special and specific arrangement described and shown in the original patent, with its specification, drawings, and model, can be sustained? And, second, whether, if the reissued patent is valid for any purpose or to any extent, the defendants infringe any rights secured to the complainants thereby?

I. Upon the first question it is insisted by the complainants that the decision of the Supreme Court of the United States in *Kirby et al.* vs. *Whitely* (11 Wallace, 679) is conclusive in their favor, and that this Court should not assume to discuss the correctness of that decision. The decision in that case does not operate as an estoppel upon the defendants in this; nevertheless the decision of a question of law arising upon the same facts is an authority which I am not at liberty and have no disposition to disregard. But that case was a very different one from this in its facts, and if I were at liberty to do otherwise, I should unhesitatingly concur in the decision of the point which was actually decided upon the evidence which appears to have been before them.

Entertaining the views I do upon the question of infringement, it is not indispensable that I should consider this first question, but in the aspect of the case which is urged by the defendants there is no necessary inconsistency with that decision; and the observations I deem it proper to make upon this reissue seem to me conclusive against the construction of the reissue upon which the complainants rely, and in no conflict with the former case.

The machine of Densmore, described in the original patent and shown in the specification, drawings, and model, was a reaper and not a mower. It was a machine which not only was not shown to be a mower, but as described and shown it had not in fact capacity to mow, in any sense material to this case. By no means shown or suggested could the cutters be made to follow the undulations of the ground. The terms of the specification are explicit: "The front end of the frame is *fastened* to the upright pieces by *bolts*, and these bolts are shifted into different holes in these upright pieces to vary the height of the cut." No terms could have been employed to state more positively that, when in use, the front end of the frame must be bolted to the uprights; the drawings show the front ends of the frame thus bolted; the model shows the same; and there is no intimation or suggestion of the practicability of using the machine in any other condition. The patentee showed a reaper with its platform, rake, reel, &c. To any suggestion that it might nevertheless cut grass at or near the surface of the ground, the answer is, if it were so bolted as to cut grass near the ground, then it did not follow the inequalities of the surface, the vital thing to make a useful mower, and the very thing which the reissue sought to embrace.

It was not until after the granting of the original patent that any attempt is proved to use the machine as a mower. That rests upon the testimony of the patentee, who himself shows that it was an unsatisfactory

experiment, and was abandoned. Other testimony leaves even this experiment in great doubt. But let it be assumed for the moment that in the summer of 1852 Densmore did mow one acre of grass with it. When that experiment was made the machine was changed; changed in substance, changed in its capacity, and changed in its actual functions.

First, by removing the bolt which secured the ends of the wheel-frame the cutter-frame was allowed to drop to the ground. Before this the wheel-frame carried the cutters, and to that end the frames had been and, according to the description given in the patent, must be bolted together; and the conception of a machine which was not so bolted, or which did not carry the cutters at an elevation (greater or less) from the ground, had not been in any manner indicated.

Removing the bolt and relying upon the ground to sustain the frame of the cutters was a distinct and different device, involving a difference in mechanical construction, the performance of a different function, and a different mechanical operation. In principle, removing a bolt does not differ from adding a bolt; and in the machine described in the original patent that bolt was a mechanical device, performing a precise and defined mechanical office, and according to the terms of the specification, as it was in fact, indispensable to that office. Removing this to produce a different result was tantamount to adding another device to the same end. An entirely distinct and different function was also thereby introduced into the machine, viz., by the oscillation or vibration of the frame, to permit the cutter-frame to undulate as the unevenness of the ground might make desirable; and, finally, the mechanical operation of the machine in the work was different, in that, before, the cutters had a rigid connection with the wheel-frame, and now they were to be operated through a flexible attachment thereto; also in that, before, the cutting apparatus was sustained and borne by the joint action of the two frames, and now it was borne forward by the one frame alone to which it was attached. In short, it became a different mechanism in relation to the work to be performed, and in the manner of performing it.

It will not do to say that it was within the scope of the original patent, because the alteration was effected by the trifling change of removing a bolt. That is not the test. Many a useful and valuable invention has been made of a device so simple and so seemingly trifling that men wonder that it was not made long before. The inquiry is, was such a device before known, and in this case, also, was this device for suffering the frame of the cutter to follow the ground in any manner indicated in Densmore's patent or his specifications, drawings, or model. If not, then his patent does not and cannot legally be made to embrace it.

Again, this removing of the bolt and thereby letting the frame of the cutters to the ground and permitting them to be drawn along the surface, was not of itself a new device. It could be done, and had been done by McCormick in his machine. The proof shows this, and to an extent quite as great as the experiment of Densmore in mowing the single acre to which he testifies.

In this there was no doubt the dawn of a new conception which has since matured and has produced what is known as the floating finger-bar, of which there is not the slightest intimation in Densmore's record, and of which I am satisfied when his patent was granted he had no idea; and even when he tried his unsatisfactory experiment he had no more found or shadowed that important invention, which now gives utility and value to mowing-machines, than McCormick had when, years before, his machines were used in mowing by a similar change in their organization; in either, if a bolt was removed the cutter-frame was made to rest on the ground.

It is urged that the machine of McCormick, when such bolt was withdrawn, was useless, and not a practical machine, and in the face of the testimony to its actual use, some witnesses express that opinion. There is at least equal weight of evidence that the same is true of Densmore's machine as patented, and there is besides further and, to my mind, satisfactory evidence that from and after the experiment alluded to he did not regard it as a practical machine for use with the bolt withdrawn, and did not so treat it. It did, according to his testimony, mow one acre of grass, but his testimony also shows that the experiment was unsatisfactory, and at least as much is proved in favor of McCormick's machine in this respect as of Densmore's. Several witnesses speak upon this subject, and they give a most satisfactory reason why Densmore's machine would not operate successfully when the bolt was withdrawn, and the frame of the cutting apparatus rested on the ground. The machinery by which the cutting apparatus is operated is only moved as the main wheel revolves, and the motion is effected by gearing connected with that wheel. Unless the wheel bears heavily upon the ground, it will wholly or partially slide instead of turning. Its power to turn the gear-wheels is derived from its firm hold on the ground, and if it slide the machinery does not operate successfully. The witnesses say, and it seems quite obvious without proof, that removing the bolt and permitting the cutter-frame to fall to the ground, removes from the wheel all the weight of the cutter-frame and platform, and the greater part of the weight of the cutter-bar, and so renders the wheel liable to slide on the ground, instead of properly turning the gear-wheels and operating the cutters.

The suggestion of impracticability comes from the complainants and their witnesses. They allege that McCormick's machine, when the bolt by which it was held in a fixed position was removed, ceased to be a practicable machine. As a reaper and carrying the heavy platform cutter-bar and cutters, that may be so; but if it is, then, for the same reason, and to the like extent, Densmore's machine was impracticable also. Indeed, he so testifies. And it is, I think, clear that neither were or could be successfully used when constructed as they were constructed and described—viz., for reaping—if the bolt was removed and the frame of the cutting apparatus was suffered to rest on the ground. It is true of both that they were reapers, and not mowers. Both were adjustable, and both, when used, were firmly bolted so as to retain the cutters in a fixed position, whether higher or lower. Densmore's record of his original patent neither shows nor suggests anything else. When used, the frames were united so as to be, in substance, one frame, wholly incapable of the vibration sought to be claimed in the reissued patent; and it appears most conclusively that, until after the granting of the patent, Densmore never contemplated such removal at all. Adjustment to more than one fixed position was all that he had conceived; and if it had been proved that he afterward, by a change in his machine, succeeded in giving the cutter-frame a vibratory motion, accommodating it to the undulations of the ground, in a manner not before invented, it is immaterial to the present questions whether the change was great or small. Invention may be as necessary to reform or adapt an existing machine to the performance of work which it would not, as originally constructed, perform, as it is to make a new machine; and whether this is done by removing a device or by adding one, by removing a bolt or by inserting a bolt, by making an apparently great mechanical change or a small one, the principle governing the subject is the same. The change being a substantial one, and producing a different result, may, if it be new, be the subject of a new patent; but it is not to be covered by the reissue of an old one which in no wise disclosed or suggested it, and especially when, in truth, the patentee had no conception of it when his patent was granted. Many an inventor has come so near to a discovery and its application that an apparently very slight change completes it and gives it great value, and yet he never attained the result. A striking instance illustrates this, and is singularly apt to the present discussion: Japy Brothers, as early as 1835, invented a machine for smoothing brass pans, kettles, &c. It served only to make the surface smooth after the pan or kettle, &c., had been reduced by other slow, and what would now be deemed tedious, means, to the desired form. Subsequent ingenuity has shown that a very slight change, either in the form of the edge of the smoothing or burnishing tool, or even of the direction of its contact with the pan, &c., (the parts being appropriately strengthened for the purpose,) produced the machine for spinning metals to form, which has revolutionized the manufacture.

But I have not noticed the whole change which was necessary in order to bring the machine within the claim of the reissued patent. Something more than removing the bolt and suffering the frame of the cutters to fall to the ground was necessary, and on this point the witnesses for both parties agree. Even according to the testimony of Densmore himself, the other part of the machine must be modified by removing the platform, rake, reel, and cutters, and substituting a different cutter-bar. No such thing had been conceived by Densmore, or in anywise appears in his suggestions, until after the patent was granted; so that when that patent was granted to him the free vibration resulting from the removal of the bolt had not been devised, and was not intimated, and, if it had been, it would have been not only useless, but destructive of the machine, unless other changes were made which had not then been devised, and were not intimated.

My conclusions upon this branch of the case are, therefore,

1st. That if the claim of the patentee in the reissued patent in question be regarded as a broad claim to hinging the frame of the cutters to the wheel-frame, and making it adjustable by changing the relative elevation of the two frames, the patentee was anticipated by McCormick, and the utmost that the patentee could claim was the particular or special arrangement of the two frames which he used.

2d. That if the patentee had invented before, or when his patent was granted, a means or mode of bringing the cutters to the ground so as to follow the undulations of the surface, the same had, to the same extent, and with equal approach to usefulness and practicability, been long before invented by McCormick, and that in this view, also, if such patentee had any claim, it was at the utmost to the special arrangement or position of the parts.

3d. That in fact, the patentee, when the patent was granted, had made no invention which permitted the cutters to vibrate so as to follow the undulations of the ground when in use, and showed no such invention or device by his specification, drawings, or model.

And 4th. That in so far as the reissued patent claims or purports to secure such a device as is last named, it is for these reasons invalid.

The claim of the complainants, in their reissued patent, which the defendants are charged with infringing, has been above quoted; the second and only other claim therein is for a wheel, provided with a crank and lever at the outer end of the cutter-bar to adjust the height thereof, as described.

It is a remarkable fact, that whereas the original patent related to other devices and with great particularity described them, and contained, in all, four claims stating severally what the patentee claimed as his invention and wished to secure by patent, the reissue makes no claim whatever to those devices. It abandons all of them and sets up claims entirely new and relating entirely to other and distinct parts of the machine, which are for a totally different purpose, and possess wholly different functions. When to this is added that the new claims embrace what did not, in fact, appear at all in the specifications, drawings, or model of the original patent, and if construed broadly embraced what Densmore had not himself invented when that original patent was granted, and that if he had, in any sense made the discovery, it was not new, it is speaking mildly to say that great suspicion attaches to the case of the complainant in any of its features.

The reissued patent was obtained in 1862. Before that date the importance, if not the indispensible necessity, for the purpose of mowing, of what is now called the floating finger-bar, following the undulations of the ground, was fully known, and various devices had been invented and adopted to meet that necessity. For the complete attainment of the result two things were requisite, first: That the cutters should rise and fall in their forward motion to pass over and adapt themselves to the elevations and depressions lengthwise of the cutter-bar; and second, they must be capable of rising and falling at either end to accommodate elevations and depressions in their path, not in the path of the wheels. For this purpose the use of a short finger-bar, hinged at the inner end to the instrument which supported it was devised, and the supporting device was in turn hinged, so that that inner end could rise and fall as the inequalities in the surface of the ground might require. The complete result was thus attained which gave name to the "floating finger-bar;" the whole would rise or fall

when the elevation or depression of the ground required it, and either end would separately rise or fall when the elevation or depression of the ground required that, in order to conformity thereto.

In this state of progress in the construction of machines for mowing, it became obvious that any one who was entitled to an exclusive right to all devices which, by hinging the cutter to the machine, made it capable of rising and falling with the surface, would perhaps control the floating finger-bar, although the device of a short finger-bar itself hinged so that either end might rise or fall without the other, was the invention of another. Here was a great temptation, and in this is the secret of the reissue in question; an attempt to extend an original patent over a feature in harvesting-machines, which, in my opinion, it did not embrace, and which the patentee had in no wise conceived when he obtained that patent; and hence appear the sweeping terms of the claim of the reissue in question.

II. If the foregoing conclusions are correct there is no question of infringement to be considered. The question of infringement is, however, an important question; it has been discussed at great length, and if it be found that upon a just construction of the patent, or upon the proofs touching the construction and operation of the two machines, the defendants do not infringe any exclusive right which the reissued patent (if valid) secures to the complainants, then it is in turn immaterial to this case whether the reissued patent be held valid or not; I therefore consider briefly the second question abve stated. If the reissued patent is valid for any purpose or to any extent, do defendants infringe any rights secured to the complainants thereby.

To the intelligible consideration of that question, it may be advantageous to notice that the machine described in the Densmore patent is a one-wheeled machine. To the use of such a machine it is necessary that it should be sustained against its tendency to tilt by some support at the outer extremity of the cutters, and this involved the necessity of a rigid connection of the cutter-bar with some frame, which, by its connection with the axle of the wheel or with the wheel-frame, would support the wheel in an upright position; hence the necessity of the two frames described in the patent of Densmore, and herein is seen one of the important functions and office of his supplemental frame.

Again, in order to sustain itself against the pressure of the grain or grass to be cut, it is essential that the cutters or the cutter-bar should be held very firmly to prevent wrenching or separation from the machine by backward pressure or thrust acting through the entire length of the cutters, and with very considerable force on the outer end. For this reason, in Densmore's machine, the finger-bar was set in a frame extending the whole width across the machine, and by firm attachment receiving strength to resist the pressure acting forcibly at its outer end. As a reaper it was strengthened by the frame of the platform. If it could be used as a mower this capability to resist the pressure was obtained by its being firmly set in what are called in his patent the side pieces of his main frame.

The defendants' machine belongs to a distinct and separate organization, which assigns it to an entirely different class of machines, and has capacities which do not belong to the others, which are availed of by the defendants without infringing the devices shown in the complainant's patent.

His *machine* is supported and runs upon two principal wheels, which sustain the machine. There is, therefore, no liability to tilting, and no need of support from the end or any part of the finger-bar, and, therefore, no need of any auxiliary frame through which such support can be derived, and there is, in fact, no such frame; and by reason of this change there is no need of a finger-bar rigidly attached (as in complainant's machine) to any frame from which it obtains its strength or power to resist the backward thrust or pressure tending to wrench it from the machine.

These offices or functions of a frame and supplemental frame, are, therefore, dispensed with; not only so, it is material to add, that the short finger-bar, hinged at the inner end, could not be used at all in the complainant's machine even if its substitution were not a departure from the invention described in the patent. The defendant's machine, therefore, not only does not use the frames described in the patent, but the functions which they exhibit in the complainant's machine would not answer at all in the defendant's; those functions are inconsistent with the use of the short hinged cutter-bar.

True, there must be an attachment of the finger-bar to the wheel-frame, through which the gearing may operate the cutters; but no frame is necessary for that purpose; any attachment which will preserve their relative position is sufficient. This is accomplished in the defendant's machine by a cross-bar or brace from the inner end of the finger-bar to a projection from the wheel-frame pivoted at each end, so that the connection may be perfectly flexible, and that it may at the same time keep the distance of the finger-bar from the gearing uniformly the same.

True also, the finger-bar must be sustained against the backward pressure or thrust tending to wrench it from the machine. This is done by what is called a "drag-bar" linked to the forward end of the wheel-frame, and hinged to the shoe which carries the cutter-bar. It is, in fact, the instrument by which, through its attachment to the forward end of the wheel-frame, the finger-bar is drawn or dragged forward to its work of cutting. It is a distinct and peculiar device, necessarily made flexible, to admit of the use of a short finger-bar hinged at the inner end, and permit it to oscillate, so as to raise or lower the points of the cutters when that is desired. It was the introduction of two-wheeled machines which made the devices by which the defendants carry and control the cutting and mowing apparatus practicable.

One or more of the complainants' witnesses represent this drag-bar and the lateral brace as constituting a supplemental frame, and would seem to intend thereby to bring this part of the defendants' machine within the literal terms of the complainants' reissued patent. It seems to me to have been an obvious perversion of language to apply to these two devices the designation. Even those witnesses were compelled, in order to satisfy their own confessed idea of a frame, to include with these bars the side and forward end of the wheel-frame, the shoe to which the cutter is attached, and the projections from the wheel-frame to which the bars are linked. They call the frame in which the wheels are placed a frame, and then include that a second time with the bars referred to, and call it a supplemental frame. This seems to me evasion and a trifling with the subject. There is not in mechanical construction, or in office and function, a frame and a supplemental frame; but a distinct and different device, serving in part some like purposes, but in a different manner, and serving those purposes where the frame used by the complainants would not serve them without the aid of other and supplemental devices not found in the complainants' machine.

This is not all. When used as a reaper the cutter-bar must be suspended at some height greater or less from the ground. In the complainants' machine, as already shown, this is effected by using the frame as a lever, turning on the axle of the wheel as a pivot, and bolting the end of the lever (or frame) in the required position. And when thus prepared for reaping the two frames bolted together constitutes one rigid frame, holding the cutter-frame firmly in position. The defendants, when their machine is used as a reaper, suspend the cutter-bar by a flexible chain passing over pulleys or rollers, not holding it firmly in position, leaving it free to oscillate and to turn on its hinges, and only limiting its possible descent toward the ground. Surely this exhibits no likeness in mechanical construction nor in mode of operation to the complainants' supplemental frame, with its arrangement as a lever, and with its adjustment by bolting above described.

I cannot avoid a conclusion in conformity with the testimony of the witnesses for the defendants, that there is no supplemental frame in the defendants' machine, and that there are not in that machine two frames, in the sense in which those terms are employed in the complainant's reissued patent, nor in any proper mechanical sense; nor are devices employed by the defendants' equivalents of the frames described in that patent. And I think I ought to say that the testimony of the expert (Mr. Renwick) that there are two frames in the defendants' machine, must have been misapprehended by the complainant's counsel when he sought, in his argument, to show by that testimony, some literal correspondence of the defendants' machine with the words of the reissued patent. I cannot for a moment suppose that the learned and experienced counsel intended to pervert the testimony or promote a misconception of its meaning.

The witness was speaking of a specific model of the defendants' machine as a reaper, and having the platform and some other attachments pertaining to it as a reaper, and, being asked if it had two frames, answered that it had. But what he meant he afterward stated, viz: a frame, to which the wheels and their gearing and the devices for drawing and sustaining the cutters were attached, and another frame, on which the platform was laid, which latter frame was wholly detached when the machine was used for mowing. The same question answered in the same sense would have assigned to the complainants' machine three frames. The witness did not say that the defendants' machine had two frames, in the sense of the reissued patent, but the contrary. He did not say that the defendants' drag-bar and lateral brace, either by themselves or in their connection, constituted a second or supplemental frame, but he very clearly excluded that idea.

Finally, the language of the claim in the reissued patent is exceedingly broad; but it, in its very terms, involves hanging the driving-wheel in a supplementary frame, or its equivalent, which is hinged to a frame which carries the cutters, (there expressly denominated the main frame,) while its *opposite ends* may be adjusted and secured at various heights, or be left free as desired, whereby the cutting apparatus may be held at any desired height for reaping, or be left free to accommodate itself to the undulations of the ground for mowing, substantially as described.

This is not to be construed to embrace every possible means by which a cutter-bar may be suspended for reaping and permitted to follow the undulations of the ground for mowing. If it should be so construed, then another fatal objection to the complainants' case would be at once suggested. The claim is too broad, and is void on that ground.

If it be construed to embrace every machine in which a frame carries the cutter-bar and is hinged to the frame in which the wheel is placed, then complainants must fail, for the reason given under the first branch of the discussion, viz.: that this would include McCormick's machines, made and used long before, as well as for the reason, also, that the defendants have never used the hanging of the wheel in a supplemental frame, or its equivalent made adjustable in any manner. Their wheel is fixed unchangeably in the only frame properly so called which they use, which neither acts as a lever, vibrates, or is made adjustable at either end or in any manner.

And if, as suggested in the other branch of the discussion, the claim can be construed to secure to the complainant the specific arrangement of two frames in the position and mode of operation described in the specification, then the defendants have not infringed it.

This somewhat incoherent and needlessly diffuse discussion of the case necessarily leads to the conclusion, on both of the grounds considered, that the complainants cannot sustain the suit.

The bill must, therefore, be dismissed with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,152.—*Attachment to Ruling-Machines.*—Granted to JOHN B. BLAIR, March 8, 1859. Hearing February 19, 1873.

23,172.—*Machines for Printing Railroad and other Tickets.*—Granted to RICHARD M. HOE, March 8, 1859. Hearing February 19, 1873.

23,246.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

23,263.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BADIN, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,299.—*Envelopes.*—Granted to SIMON B. PETTES, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 29, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 29, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,366.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,435.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 29, 1864, and May 14, 1867. Hearing March 12, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, JR., April 5, 1859. Hearing March 12, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 12, 1873.

23,451.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 12, 1873.

23,520.—*Burnishing Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 12, 1873.

23,525.—*Bolstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 12, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 12, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 12, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859. Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 22, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SMALTZER, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,894, 4,895, and 4,896, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, JR., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, JR., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,920, 1,921, 1,922, and 1,923, June 6, 1865; No. 1,920 having been ordered to again reissue, No. 5,229, January 26, 1875. Hearing April 9, 1873.

23,799.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

22,793.—*Cracker Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 16, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MENSHON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,880.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURRAY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,096.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOICHKISS, June 14, 1859. Hearing May 28, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

EXTENSIONS GRANTED.

22,991.—*Improvement in Water-Wheels*, granted to JOHN TEMPLE, February 8, 1859; reissued February 10, 1863, numbered 1,405.

Claim.—1. The construction and use of the scroll sluice-gate B C, applied to operate with a water-wheel, in the manner substantially as described.

2. In combination with the hinged sluice-gate B C, the guard A, as and for the purpose described.

3. The levers K and ring J, centrally arranged above the sluice-chest for simultaneously operating a series of gates, in combination with the gates, and actuated by mechanism, substantially as described.

Disclaimer filed February 20, 1873.

Disclaims third clause of claim, as above set forth.

23,085.—*Improvement in Lamps*, granted to ELIAS J. HALE and CHARLES H. CHANDLER, March 1, 1859.

Claim.—1. An improved rack wick-holder, as constructed and applied to the wick and the spur-wheel, so that the teeth of the latter may pass through the rack and act on both the rack and the wick at one and the same time.

2. The flange or collar J, for the purpose of equalising the aerial current as it strikes the flame of the wick.

23,105.—*Improvement in the Construction of Steam-Vessels*, granted to JAMES MONTGOMERY, March 1, 1859.

Claim.—1. Constructing the hulls of vessels with one or more cavities in the bottom, commencing at or near the stem, increasing in capacity sternward, substantially as and for the purposes set forth.

2. Constructing the bottoms of vessels with corrugations extending from stem to stern, as set forth, which give strength to the hull and a portion of which form the cavity or cavities above referred to.

3. The described combination of an inclined screw-propeller with a hull constructed as set forth.

4. Two or more rudders, operating as set forth, in combination with the described longitudinal cavities in a ship's bottom.

DISCLAIMER FILED.

22,991.—JOHN TEMPLE.—*Improvement in Water-Wheels.*—Granted February 8, 1859; reissued February 10, 1863, numbered 1,405. Disclaimer filed February 20, 1873. Disclaims:

"That clause of the claim in said reissued patent which is in the following words, to wit: 'Also, the levers K and ring J, centrally arranged above the sluice-chest for simultaneously operating a series of gates, in combination with the gates, and actuated by mechanism, substantially as described.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date February 18, 1873.]

ORIGINAL PATENTS.

135,874.—*Coal-Mining Machinery.*—JOHN ALEXANDER, Gartsherrie, Scotland.

The machine is drawn forward by the barrel, which takes up a rope attached to the machine and passed around some object in advance. The track may be taken up and relaid as the machine advances.

Claim.—1. The chain and barrel operated by a ratchet-wheel worked by an eccentric or crank on the vertical shaft which drives the endless chain for obtaining a progressive motion of the machine, substantially as and for the purposes herein set forth.

2. The plain or unflanged carrying-wheels, combined with the pins or lugs 4, which prevent the displacement of the machine from the rails, substantially as and for the purposes herein set forth.

3. The sleepers 31, arranged with their snugs 32, and the keys 33 and jaws 34, to firmly connect the ends of the rail-lengths 3 into sockets, in which last the snugs enter, substantially as and for the purposes herein set forth.

135,875.—*Reed-Organ.*—CHARLES AUSTIN, Concord, N. H.

The air tends to close the valves instead of opening them, and the tracker-pins run in air-tight tubes leading directly through the wind-chest.

Claim.—In reed instruments having either one reed-set or two or more reed-sets, placed one above the other, the valve-pins passing through the wind-chest, in combination with the blocks, tubes, or casings, substantially as described.

135,876.—*Steam-Tight Joint of Valve-Stems.*—GEORGE R. BABBITT, Providence, R. I., assignor, by mesne assignment, to himself and WILLIAM A. HARRIS, same place.

A recessed bracket, through which the valve-stem passes, and which is provided with a collar to prevent leakage of steam, obviates the use of a stuffing-box. Any steam that has leaked through is condensed in the recess of the bracket and is withdrawn by a drip-pipe.

Claim.—The combination of the recessed bracket E and flanged stem F D, substantially as described, for maintaining a tight joint for a rotating valve-stem in place of a packed stuffing-box, as set forth.

135,877.—*Sectional Steam-Boiler.*—GEORGE H. BABCOCK, Plainfield, N. J., and STEPHEN WILCOX, Brooklyn, N. Y.

Inclined tubes are secured in a single casting at each end and are joined to a separating vessel over them. The pipes or tubes are arranged in a sinuous manner, and opposite each tube is arranged a hand-hole to allow them to be removed or cleaned.

Claim.—1. A sectional boiler having inclined tubes in sections joined to a separating vessel, A, presenting a large surface for the separating of the steam from the water, and having the ends of the sections formed each of a single casting or connecting-piece with a hand-hole opposite to each tube, which will allow the insertion of a new tube when required, the tubes being connected and arranged substantially as herein set forth.

2. The sinuous pipes D^1 D^2, in combination with a series of tubes, B B, fixed therein, and with hand-holes d to allow of access to the interior of the tubes, and of the removal and insertion of the same, and adapted, when placed side by side, to produce a staggered position of the tubes B, all substantially as and for the purpose herein set forth.

135,878.—*Folding-Case.*—JOHN C. BARKER, Chicago, Ill., assignor of one-half his right to JAMES L. BRANSON, same place.

The top is formed in two parts, each part composed of two side pieces and a number of cross-pieces. The sides are formed of slats, with the bottom one rounded at the edge next to the bottom. The bottom is composed of side pieces with cross-slats, and the ends are formed of any number of slats and are fastened together by cross-stripe made long enough to project above the top slat, so as to serve as a stop to prevent the slats of the end pieces from passing between the slats of the sides. The several parts are hinged so as to fold compactly.

Claim.—The combination of the folding-case, having its sides, ends, and top hinged to fold, as herein described, with the pivoted cross-pieces G, when constructed and arranged to operate substantially as and for the purpose set forth.

135,879.—*Treating Asphalt.*—PETER BARTHEL, Frankfort-on-the-Main, Germany.

The asphalt is dissolved with sulphuret of carbon or benzine aided by steam-heat, and is then strained through a sieve to clear it of its mechanical impurities.

Claim.—1. The arrangement of a sieve, L, in the kettle A above the material to be dissolved, substantially as and for the purpose hereinbefore set forth.

2. The combination of the kettle A, boiler E, and worm U, connected together in the manner and for the purpose substantially as set forth.

3. The combination of asphalt, purified of its mineral impurities, with the sand of calcareous spar or marble in the proportions and for the purpose substantially as described.

135,880.—*Stove-Pipe-Elbow Machine.*—JOHN BECKMANN and JOHN GIBSON, Cincinnati, Ohio.

The sheet of metal is slitted on both side edges in such a manner that the surplus metal is taken up in bending by lapping the cut metal.

Claim.—1. The clamps S S, K K′, and E E, press-block M, operated substantially as described, in combination with cylinder C and proper supports therefor, whereby the metal is formed into an elbow ready to be riveted.

2. The slotted crank L, carrying roller *t* with mechanism causing it to travel around eccentric M′, substantially as and for the purpose described.

3. The connecting mechanism composed of levers I I′ and T, links H H′, punch J and set J′, either or both, and proper supports for the whole, substantially as shown and described.

4. A stove-pipe elbow made from sheet metal, slitted as shown and described, when the slitted pieces are formed and united substantially as set forth.

5. An elbow-machine, consisting of the elements embodied by the first, second, and third claims, when constructed and arranged substantially as herein described.

135,881.—*Folding-Table.*—JOHN F. BIRCHARD, Milwaukee, Wis.

The table top is supported on brackets at or near the outer edge of the same, and rocks or turns on pins passing through said brackets and into a permanent or fixed frame with four feet. Under the center of the fixed frame is pivoted a revolving frame that supports two sides of the table when in use, but when the table is folded the movable frame folds closely against the fixed frame.

Claim.—A folding-table, with top or leaf A supported by brackets at or near the outer edge of the same and rocking on pins passing in or through said brackets and into frame B, in combination with frames B and C, substantially as described.

135,882.—*Clamp.*—CHARLES S. BONNEY, Philadelphia, Pa.

The forked prongs can be adjusted on the corners of miter-joints as well as on flat surfaces.

Claim.—The combination of the notched bar A having the curved forked ends B B pointed with the hemispherical knobs C C with the sliding standard E and screw E′, substantially as and for the purpose described.

135,883.—*Saw-Filing Vise.*—CHARLES S. BONNEY, Philadelphia, Pa.

Claim.—The adjustable screws H H, in combination with the jaws A B for springing the saw to any desired amount to prevent the trembling of the same.

135,884.—*Carpet-Fastener.*—CHARLES B. BROUNE, Genesseo, Ill.

To the base-board are attached fasteners having slots, in which the toothed metallic plates slide and engage with the carpet.

Claim.—The combination of the fasteners *b c* and the toothed metal plates *d f*, all constructed and used substantially as and for the purposes set forth.

135,885.—*Spring Bed-Bottom.*—ISAAC BUSH, Indianola, Iowa, assignor of one-half his right to CHARLES MCKAY, same place.

In the center there is an adjustable longitudinal bar carrying coiled springs; at the head a graduated block, permanently fixed to side pieces, for elevating the head.

Claim.—In the construction of a spring-bed, the combination of the graduated blocks *a a* and the sliding piece G carrying a series of coil-springs, substantially as described, and for the purposes specified.

135,886.—*Manufacture of Iron.*—WILLIAM BUSHNELL, New York, N. Y.

When the ore in the upper chamber becomes partly roasted it is mixed with fine coal and transferred to the middle or closed chamber, where it is deoxidized, and is then removed to the puddling-hearth. The blast-pipes are situated in a couple of chambers formed in the flue, so that they can be heated at will by the escaping products.

Claim.—The peculiar construction and arrangement of the air-tight chamber B in connection or combination with the puddling-chamber C, the roasting and purifying chamber A, the boilers K K, and the hot-blast pipes L, all arranged substantially as and for the purposes set forth.

135,887.—*Bolt-Cutter.*—LEONARD J. CHAPMAN, Vallejo, Cal.

Claim.—1. The cutters B and C, with their operating-levers D and E, the nut F, and screw I, together with the adjusting-block G and the guiding-ways A A, substantially as and for the purpose described.

2. In combination with the operating-levers D and E and the nut F, the slide J and connecting-rod K for preserving the screw I in its vertical position in the nut, substantially as herein described.

135,888.—*Sky-Light.*—GEORGE B. CLARKE, Leonardsville, N. Y.

The sky-light frame is fitted over a water-tight rim or collar on the roof, and is inclosed by a movable hood above, which latter is raised and lowered by a central shaft passing through the sash and made adjustable in a tube sustained by brackets attached to the under side of the roof. A water guard or fender is placed around all upon the roof to ward off the rain from the vicinity of the sash and collar.

Claim.—1. The cap A, provided with rim *a* and tubular perforated center shaft B, substantially as and for the purposes herein set forth.

2. The combination of the cap A and window D, constructed and arranged substantially as and for the purposes herein set forth.

3. The combination of the cap A, window D, and collar E, constructed and arranged substantially as and for the purposes herein set forth.

4. The combination of the cap A, hollow shaft B, window D, collar E, and bracket G, constructed and arranged substantially as and for the purposes herein set forth.

5. The weather guard or fender H, arranged in combination with the cap A and window D, substantially as and for the purposes herein set forth.

135,889.—*Hand-Truck.*—JAMES J. COLLINGBOURNE, New York, N. Y.

Claim.—1. The rods *b b* sliding in the side bars A A of a truck, combined with and attached directly to axle-brakes C C, as described.

2. Sleeves *d d* sliding on the handles, combined with rods *b b* sliding in the side bars, as described.

3. The sleeves sliding on the handles, the rods *b b* sliding in the side bars, and the spring axle-brakes C C, all combined, located, and operated together, as described.

135,890.—*Car-Coupling.*—WILLIAM T. COLLINS, Winchester, Ill.

The coupling-pin is upheld by means of a slide, which is actuated by a spring, and the link upon entering the draw-head strikes a projection on the sliding plate, which is connected with the slide upon which the pin rests, forcing back the same until the hole in the slide and draw-bar are in line, when the pin falls and secures the link.

Claim.—The combination, with a buster having vertical grooves *x*, of the sliding catches *b*, the slide *f*, flange *e*, springs *k* and *w*, and the tilting-plate *a* pivoted in slot *y*, to have vertical as well as pivotal motions, substantially as specified.

135,891.—*Water-Wheel.*—NICHOLAS J. COLMAN, Railroad Flat, Cal.

A series of central buckets, having wedge or plow shaped points, are combined with two series of buckets, which are curved outwardly from the central ones and also upwardly toward the periphery of the wheel, where they discharge to the right and left. By this construction it is claimed that the water exerts its force upon the full length of the buckets, and the power is not lost by the centrifugal force caused by the high velocity of the wheel.

Claim.—1. The wedge or plow shaped buckets, dividing the water at *e*, and curving toward the sides at *f*, substantially as and for the purpose described.

2. In combination with the wedge-shaped buckets, as shown, the upwardly-curving buckets *g* discharging at the periphery, substantially as and for the purpose herein described.

135,892.—*Spring Bed and Frame.*—WILLIAM Z. COOKE, Hartford, Conn.

The wire mattress is hung at each end to C-shaped springs; a frame hinged near the center of the main frame and works automatically; the cross-bar of the pawl-frame having pins in the ends which engage with notches in the side frame, and the head-bar a hook, which engages with a catch located centrally in the head-bar of the bedstead.

Claim.—1. The spring or wire mattress *g*, in combination with the frames *a* and a^1, hook *b*, catch *c*, and cords *c′* and *d*, substantially as and for the purpose set forth.

2. The pawl-frame a^2, pins a^3, racks a^4, and notches a^5 a^6, combined with the frame *a* and mattress, substantially as and for the purpose herein specified.

3. The frames *a* a^1, combined with a spring-mattress and rack, so that the spring-mattress will automatically be raised to an inclined position, substantially as and for the purpose described.

4. The figures *g* hooked together, as described, the springs *e*, and frames *a* a^1 a^2, all constructed and arranged for operation, as and for the purpose herein specified.

135,893.—*Button-Hole Cutter.*—AUGUSTUS DAY, Detroit, Mich.

Claim.—The case A, having the slot *b*, in combination with knife B, having the opening *d*, as described.

135,894.—*Printer's Lead-Rack.*—OCTAVUS A. DEARING, San Francisco, Cal.

The rack is constructed to hold leads of different lengths and is provided with a gage by which they can be measured.

Claim.—As a new article of manufacture, a lead-rack for printers, having its top and bottom tapering, and constructed substantially as described.

135,895.—*Stop-Cock and Regulator for Gas-Burners.*—AMÉDÉE E. DELOUBET, Buffalo, N. Y., assignor of one-half his right to POH and RAICHLE, same place.

A double cock is provided with a key with two holes through it, and above this two regulating-cocks (one in each passage) are arranged to regulate the supply of each of the gases used.

Claim.—1. The combination of the double cock A, having two distinct and separate pipes, C C′, leading to it, and the regulating devices B B′, and the burners D D^1, all constructed and arranged substantially as and for the purpose specified.

2. The combination and arrangement of the double cock A, passages *a a′ b c e e′*, substantially as shown and described.

3. The peculiar arrangement of the passages *b*, *c*, *e*, *e′*, and *d*, as shown and described.

135,896.—*Sled-Fender.*—ALBERT L. DIRST, Seward, Ill.

The shoe or frame *a* is arranged with vertical longitudinal slots for the bars and lateral slots for the bolts securing the same, whereby the spaces between, or the angle of, the bars may be changed. The horizontal part of the shoe also has transverse slots to adjust the fender parallel to the beam or otherwise.

Claim.—The shoe *a* having the slots *s* and *t*, in combination with the bent adjustable bars S, arranged as shown, whereby the spaces between the bars and the distance and angle from the plows may be regulated at pleasure, as and for the purposes set forth.

135,897.—*Shaping and Arranging Tobacco for Packing.*—JOHN K. ERICKSON and JACOB R. HARRIS, St. Louis, Mo.

The tobacco is first formed into a pointed roll, then bent together and twisted, then pressed sufficiently to break the edges of the wrapper and expel the air and reduce it to proper form, and finally placed in the receptacle, the smaller ends toward the center and overlapping.

Claim.—1. As a new article of manufacture, the cake or plug of tobacco, Fig. 4, when pressed substantially as herein described.

2. The arrangement of the cakes, Figs. 5 and 6, in the drum, substantially as shown and described.

135,898.—*Screw Bolt and Nut.*—THOMAS ENGLISH, Dulwich, England.

The threaded portion of the bolt is slightly tapered, and the walls of the nut are correspondingly convergent, and the threads on both are made full and uniform at the extremities or smallest diameters, but those of either the bolt or nut, or both, gradually diminish in depth or prominence from said extremities back to the entering-surface of the nut.

Claim.—The use of bolts and nuts wherein the diameter of the bolt measured at the bottom of its thread increases toward the shank, substantially for the purpose, and in the manner above described.

135,899.—*Grain-Band, Bag-Tie, &c.*—ELISHA FOOTE, East Bloomfield, N. Y.

Holder for tie-rope, round at upper and wedge-shaped at lower end. Loose end of rope-band caught and held by wedge-shaped end.

Claim.—The holder A B B′ C, constructed substantially as described.

135,900.—*Fishing-Line.*—FERDINANDO E. FORSTER, New York, N. Y.

Three strands of floss silk are first twisted separately and then the three twisted together and covered spirally with twist silk. The whole is then thoroughly soaked with balsam of fir.

Claim.—As a new article of manufacture, a fishing-line made from silk, covered and saturated as described.

135,901.—*Window-Screen.*—CHARLES W. FOWLER, Chicago, Ill.

A hood upon the top of the frame A contains a spring-roller, which carries the screen. Said screen moves up and down in the groove of the frame, and is held down by a spring-catch.

Claim.—1. The grooved frame A provided with the covering or apron B, in combination with the roller C provided with a curtain or screen, E, and operated by means of the spring D, substantially as described.

2. In combination, the grooved frame A provided with the covering or apron B, the roller C provided with the curtain or screen E, and operated by means of the spring D, the spring-catch F, piece *c′*, and perforated clasp *c*, substantially as and for the purpose specified.

135,902.—*Scaffold.*—ABNER GATES, Barnside, Ill.

The scaffold is elevated against the building by the extensible shaft, and has three wheels to diminish friction, the upper two of which are placed widely apart. A bench is placed upon the upper portion.

Claim.—1. A builder's scaffold formed with the several parts of the platform, as shown, having parts F and F′ on different levels, the car with wheels resting against the side of the house, and the elevating-beam E, all combined as set forth.

2. A builder's elevating scaffold-car formed of an upright central part and a top cross-part extending to a considerable distance on each side, and having wheels on each end of the cross-part resting against the wall, substantially as set forth.

135,903.—*Machine for Jointing Staves.*—ROBERT W. GEORGE, Boston, Mass.

The stave is carried forward by an endless feed-chain under pressure-rollers, and is jointed by two revolving cutters, which operate simultaneously upon its opposite edges.

Claim.—1. The feeding-chain C, in combination with guide E, pressure-rolls, spur guide-wheel F^2, and cutter-heads H H, operating as specified.

2. The chain C provided with dogs *e* and spurs *d*, in combination with pressure-rolls F^1 F^2, cutter-heads H H mounted on sliding frames L on adjustable plates M, and operated by cams K, in the manner and for the purpose set forth.

135,904.—*Manufacture of Starch.*—COLGATE GILBERT, Buffalo, N. Y.

Claim.—The follower, packing, &c., of a starch-mill, adjusted, as herein described, by means of the elongated screw-rods *a a* passing through the follower C and entirely through the bushing B, so that the follower can be drawn down and the packing thereby tightened while the mill is in operation, as hereinbefore fully set forth.

135,905.—*Pump-Piston.*—CALVIN B. GILL, Rochester, N. Y.

A hollow pump-rod terminates below in a hollow arch leading into a chamber in the piston, which has an opening for a valve-seat above, and below for a single valve. On the descent, the valve closing the upper orifice, the water passes in below through the chamber and arch and out through the rod. On the ascent the lower orifice is closed, and the water passes through the upper opening.

Claim.—1. The construction of the piston of a double acting pump, with the arched water passage E, leaving a clear passage, *a*, for the entrance of the induction water beneath it to the piston, as herein shown and described.

2. The arrangement, with the parts A B of a double-acting piston, of the central disk-valve D, playing between the induction-ports *b d*, and the radial wings or ways *f f*, serving as guides to the valve, substantially as herein shown and described.

135,906.—*Condenser for Steam-Engines.*—SIMEON A. GOODWIN, Buffalo, N. Y., assignor to WILLIAM D. TABER, same place.

Claim.—1. A condenser for steam-engines, composed of the blow-through pipe B and condensing-chamber C, and operating substantially as described.

2. The heater G, when combined with the blow-through pipe B and condensing chamber C, when operating as described.

135,907.—*Rotary Cutter-Head for Matching Boards.*—GEORGE GREENWOOD, Lawrence, Mass.

A circular plate has curved grooves formed in one of its faces to receive correspondingly-shaped cutters, which are further secured by a screw-bolt passing through the plate.

Claim.—The improved cutter-head, made with circular curved grooves or cutter-sockets, and with deflecting notches *f* arranged in it, as set forth, and in combination with correspondingly-curved cutters fixed in such grooves by clamps *d*, all being as shown and described.

135,908.—*Steelyard Scale.*—THOMAS C. HARGRAVE, Boston, Mass.

The steelyard arm or beam is made detachable from the fulcrum portion, which latter, when freed from the former, allows the load shackle to rest upon the suspending stirrup, thereby relieving the knife-edges from their bearings when the instrument is used as a hoisting-tackle.

Claim.—1. The link A, in combination with the link B, with its slotted shanks *e* and *c*, and the lever *b* with its pivots *r* and *a'*, and hook *c'*, all constructed and operating as described.

2. The scale-beam K, composed of two parts, connected as shown at *i o*, capable of being disconnected, the part containing the knife-blades remaining in position for weighing, while the graduated bar is removed, as herein described.

135,909.—*Stove-Grate.*—ANN MARIA HARRIS, Columbus, Ga.

Claim.—A grate provided with a series of vertical bars, *b b b*, to form a rear grate to the flues, the same being supported on the legs *d* and the journals *a a*, to operate substantially as and for the purposes herein set forth.

135,910.—*Sectional Steam-Boiler.*—JOHN HARRIS, Baltimore, Md.

The front and back connections are combined with tapering tubes, arranged in an inclined manner. The front connection is connected at its upper end with one or more separating vessels of cylindrical form by a saddle-piece having a straight bottom, and embracing the vessels about one-half of their diameter. The object is to provide for the changes of bulk of fluid at the different points in the circuit to suit the different temperatures of fire.

Claim.—1. The wedge shaped front connections G and back connections D, in combination with suitable nearly horizontal tubes E and separating-chambers, and means for allowing a continuous current through the combined parts, the whole constituting a boiler providing for the changes of bulk of fluid at the different points in the circuit, as herein specified.

2. The saddle-formed connecting part H, in combination with the chamber A, front connection G, and suitable tubes and back-connecting parts, as herein set forth.

135,911.—*Heel Nailing and Shaving Machine.*—LORENZO P. HAWKINS, Lynn, Mass., assignor to NICHOLAS COOMBS, same place.

A guard-plate, which overlaps the spring, protects the spring and prevents the knife (in case of fracture of the spring) from cutting deep into the heel or sole edge.

Claim.—In combination with the clamp A and spring D, the guard or shield F, independent of the spring, and forming part of plate E, substantially as and for the purposes stated.

135,912.—*Cultivator.*—JACOB B. HINCKLEY, Nacogdoches county, Tex.

Claim.—1. The beam D, plows *c* and E with straps *b* and braces *a*, beams F, straps *d*, pivots *f*, and links *e*, sliding bars *g*, bar K, and wheel *i*, for the purposes specified.

2. Lever G, standard H, lever *m*, fulcrum-bar *n*, pin O, slot or groove *p*, and chain *r*, and notches *s*, in combination with the frame of a wagon or cart, for the purposes specified.

135,913.—*Cartridge-Loading Machine.*—ALFRED CHARLES HOBBS, Bridgeport, Conn.

Spring-jaws operated by suitable mechanism, and a feeding-tube for cartridges, whereby the cartridge next to the bottom one is raised away from contact therewith and automatically released after the first cartridge has been removed.

Claim.—1. A device for automatically feeding or presenting cartridge cases or equivalent articles, constructed and operating substantially as herein specified, so as to place the foremost one in position, and then lift the succeeding one away therefrom previous to placing it in position.

2. The combination of the reciprocating spring-jaws *f f* with the feeding-tube C and the plate or receiver D, substantially as and for the purpose herein specified.

3. The combination of the tube C, sleeve G, slide I, and cam M, substantially as and for the purpose herein set forth.

135,914.—*Door-Spring.*—AUSTIN D. HOFFMAN, Chicago, Ill., assignor of one-half his right to NATHAN FRIEDMAN, same place.

A metallic angle-bar or post is secured to the outside of the door, near the top, extending outward at right angles thereto, and a wheel is pivoted to the extremity of this bar, turning freely upon it. A flat metallic spring is firmly secured at one end in this wheel, coiling around the same, while the free end is securely fastened to the outside casing above the top of the door. The opening of the door uncoils the spring, and as the spring coils again the door is closed.

Claim.—The combination of the angle-bar B upon the door, wheel C, and spring D, as described, the spring secured above the door and acting to close the same by coiling around the wheel, substantially as specified.

135,915.—*Machine for Cutting Nails.*—SAMUEL P. HOLLIS and HARVEY B. CHESS, Pittsburg, Pa.

The bed-knives are constructed in such a manner that the ribs of the nail-plate will lie in depressions in the cutting-edge, and the whole, when ready to be cut, rests firmly on the bed. The lines of the cutters are arranged to cut the rib of the plate at right angles to the length and the tang at an obtuse angle.

Claim.—1. The cutting-knives B B', ground with their cutting lines, as described.

2. The knives A and A', ground, constructed, and arranged as described.

3. The knives B and B', in combination with the knives A and A', all constructed and arranged as set forth.

4. The gage C, when arranged to project slightly beyond the face of the knife B, and extending laterally far enough to take in the rib of the nail-plate, as described.

135,916.—*Flooring-Tongs.*—EDWARD J. HOUSTON, Nacoochee, Ga.

The joist is clamped by the teeth which form the fulcrums, the arms serving as levers to press up the boards.

Claim.—The flooring-tongs A herein shown and described, constructed with points *a* and clamping device *b b'*, and used in the manner substantially as set forth.

135,917.—*Mortising-Machine.*—EDWARD J. HOUSTON, Nacoochee, Ga., assignor of one half his right to E. F. STARR, same place.

The spring is supported in the frame and pivoted to the plank, making the machine portable.

Claim.—The combination of the plank C, spring *d d' e*, shackle *f*, and stirrup A *g*, and treadle D and its connecting parts, with the frame of the machine A, when all are arranged substantially as and for the purposes specified.

135,918.—*Tool-at-Comb.*—I. SMITH HYATT and JOHN W. HYATT, Albany, N. Y.

The back of the comb, between the teeth, comes to an edge, to be the easier cleaned.

Claim.—A toilet comb in which the base of the kerfs or slits between the teeth are formed by the two inclines or grooves *a a*, arranged in the manner herein shown and described.

135,919.—*Tuck-Creaser for Sewing-Machines.*—ALLEN JOHNSTON, Ottumwa, Iowa.

The vibratory lever is pivoted about the hollow journal, projecting from a standard from the bed-plate, and through this hollow journal-arm passes one bar of the rocking-frame, the other bar passing through the lever, which, operated from the needle-bar, rocks or vibrates the said frame, causing its notched end to impinge the fabric passing over the spur on the adjustable gage-plate.

Claim.—1. In combination with the base-plate and vibratory lever or arm E, the rocking or vibratory notch-carrying frame, constructed as herein described, and arranged to pass loosely through said lever at the axis of vibration of the latter, and also at a point between said axis and the free end of the lever, in the manner and for the purposes set forth.

2. In combination with said base-plate, vibratory lever or arm, and rocking or vibrating notch carrying frame, combined as above described, the gage-plate C mounted upon said base-plate and connected with said frame, so that it shall follow the sliding movement, but not the rocking or vibratory motion of the same, as set forth, and provided with an arm carrying the dressing edge or point *p* and a flexible strip, *j*, constituting the gage or scale, said parts being constructed and arranged together substantially as shown and set forth.

3. In combination with the parts specified in the clause last preceding, the guide-plate, constructed and arranged to operate in connection with said parts, as set forth.

135,920.—*Car-Starter.*—JOSEPH B. JONES, Philadelphia, Pa.

A clutch, which is connected by a band to the propelling mechanism on the axle, is so arranged with the brake-shaft that it may be thrown in or out of gear by means of a lever which is placed within reach of the driver.

Claim.—The combination of the brake-shaft *h*, clutched chain-barrel *n*, chain-gear *i i'* and *j*, gearing B C, pawls *c*, ratchet-wheel *d*, and axle A, substantially as hereinbefore set forth.

135,921.—*Water-Heater.*—JOHN KENFIELD, Jr., Elmira, N. Y.

The heater is designed for use upon an ordinary cook-stove or range, and is provided with a damper to regulate the extent of surface exposed to the heated products of combustion, and with a hood for carrying the waste heat to the chimney.

Claim.—A water-heater containing flues B and B', in combination with the damper C and hood D, substantially as specified.

135,922.—*Floating Fire-Engine.*—JOHN C. LANG Washington, D. C., assignor of three-fourths his right to PHILIP B. FOUKS, New Orleans, La.

Pipes or tubes and a pivoted platform are connected with a boat, the platform adapted to be used as a gangway and to carry and operate the tubes for conveying water from a fire-engine.

Claim.—The combination and arrangement, within a gangway or movable platform, of the pipe or pipes, substantially as described, adapted to be used in connection with suitable force-pumps, for the purposes set forth.

135,923.—*Safety-Hatch for Railroad Cars.*—ROBERT LISTON, Albany, N. Y.

On both sides of the hatchway are placed strips, each having reversed beveled sides, to receive the hatch-cover, which has lap-pieces to conform to the strips. The cover is secured in place by means of a compound bolt, consisting of a bed piece, and two slides on the top and one edge of each of which are racks, a segmental lever which operates one slide, a pinion which communicates the motion of the slide operated by the lever to the other slide and forces it in an opposite direction, bolts which work in guides in the cover, and cross-bars which connect the bolts to the slides.

Claim.—1. In combination with the hatchway B, the edges of which are provided with the strips C C and rubber strips F, the cover D provided with the lap-pieces E E and clasps N N, and the combination bolt G H H' I J K L M, arranged as described, for the purposes hereinbefore set forth.

2. The combination bolt G H H' I J K L M, in combination with the cover D, as and for the purpose hereinbefore set forth.

135,924.—*Dentist's Stool.*—ISRAEL W. LYON, New York, N. Y.

The lower end of the upright standard has a segmental cogged-wheel termination which engages with teeth upon a curved piece pivoted under the base. This curved piece or dog is operated by a pedal projecting from one side of the base, by means of which the stool can be held at the desired inclination.

Claim.—The cogged or toothed wheel-shaped termination B of the standard A, the dog C, the pedaled eccentric D, the lug or teat *i*, and the base S, all combined and arranged substantially as and for the purposes shown.

135,925.—*Construction of Metallic Sieves.*—ROBERT J. MANN, Burlington, Iowa.—Case A.

A means of securing the sieve-cloth to the bottom of the hoop or band, a separate hoop forming a bottom-rest for the sieve and protecting the sieve cloth from wear.

Claim.—The combination of the hoop or band A and the sieve-cloth B, secured together by the folds C and E, substantially as and for the purpose specified.

135,926.—*Construction of Metallic Sieves.*—ROBERT J. MANN, Burlington, Iowa.—Case B.

A mode of securing the sieve-cloth to the bottom of the metallic hoop by a double fold of the latter clasping a double fold of the cloth.

Claim.—1. The combination of the metallic hoop or band A and the sieve-cloth B, secured together by the outwardly-turned clasp or fold of their edges C, substantially as and for the purpose specified.

2. The combination of the outwardly-turned clasp or fold C and the hoop or band D, substantially as and for the purpose specified.

135,927.—*Canning Fruit.*—JAMES B. MATTHEWS, Cincinnati, Ohio.

The fruit is placed in cans and arranged in a tray, which is put on an endless chain and conveyed into a steam-heater. Afterward the cover of the can is soldered, and they are again carried through the heater.

Claim.—1. The apparatus for canning articles, composed of heater A with bed B, endless chain C, and sliding frame D, combined and arranged substantially as herein set forth.

2. The process of heating, sealing, and canning fruit and vegetables, in the manner and by the means substantially as herein set forth.

135,928.—*Breech-Loading Fire-Arm.*—EDWARD MAYNARD, New York, N. Y.

Special combination claimed for raising the hammer to half cock in the act of throwing up the rear end of the barrel to uncover the breech.

Claim.—The combination of the breech-lever E, elbow D, and lever *b* with the tumbler or lower part of the hammer, substantially as and for the purpose described.

135,929.—*Manufacture of Car-Springs.*—NATHAN MIDDLETON and ALLEN MIDDLETON, Jr., Philadelphia, Pa.

Claim.—The improvement described in car-springs and in the manufacture thereof—that is to say, a spring composed of a number of spirals of Bessemer or homogeneous steel wire, cold-drawn or cold-rolled, and coiled while cold, as herein set forth.

135,930.—*Sewing-Machine.*—JEHU C. MOORE, Madison, Ind.

Claim.—The feed-bar J, supported in a mortise in the piece K in front of the pulley F, and provided with a stud, *s*, of rawhide to prevent contact of said bar with the plate C, substantially as described, and for the purposes set forth.

135,931.—*Cushion and Sharpener for Sewing-Machine Needles.*—JOHN D. NESBITT, Foxborough, Mass.

Claim.—A needle-cushion, *a*, and whetstone or other suitable sharpener, *d*, arranged on an adjustable frame, *c*, so as to turn in and out under the top of a sewing-machine table or frame, substantially as specified.

135,932.—*Grain-Drill.*—SHERMAN R. NYE, Winchendon, Mass., assignor to himself and CHARLES J. RICE, same place.

Under the back of a hopper there is a lateral outlet for the seed. Behind this back, suspended to a rod, there is another piece which adjustably covers the outlet by means of a cam, with a pin thereon, on each end of the rod. These pins are clamped in slots, forming the top portion of plates affixed to the sides of the hopper, which are vertically adjustable by slots and clamp-screws.

Claim.—A hook or apron, *z*, turning on a rod, *p*, provided with eccentric cams *n n'* adjusted by a thumb-screw, *w'*, engaging in a curved slot, *m*, formed in one of two adjustable standards, *k k'*, connected with a hopper or body, *g*, of a sowing-machine, so as to raise and lower the apron or back *z*, substantially as and for the purpose specified.

135,933.—*Bed-Bottom.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

Wire strands are attached to the head-bar by springs and to the foot-bar by staples. A head-rest is formed by joining the strands with rings and links, and operated by a ratchet and pawl.

Claim.—1. A bed-bottom formed of single wire strands attached at the head to conical springs and to the adjustable foot-bar by staples, as described.

2. The head-rest formed by the jointed wire strands and the frame pivoted to the side rails and operated by the ratchet and cord, as described.

3. The wire strands, attached to the head bar by springs and to the foot-bar by staples, in combination with the head-rest and adjustable frame, constructed as described, and for the purposes set forth.

135,934.—*Machine for Cutting Saw-Teeth.*—JAMES H. W. ORION and WILLIAM H. H. LARDUSKEY, Baltimore, Md., assignors of one-third of their right to WILLIAM D. F. LARKIN, same place.

The frame or holder is cylindrical and has a revolving cutter, similar to a screw-cutting tap, passing through its center. The cutter is fed down by a screw made on its upper part, which turns in a nut fastened to the top of the frame, the pitch of the screw and of the cutting-teeth being the same. The blanks to be cut are fastened in clamps which are held in radial longitudinal slots in the cylinder by rings or bands passing around them.

Claim.—The combination, substantially as shown and described, of a revolving shaft provided with one or more series of cutting-teeth on its convex surface, and one or more clamps or equivalent devices, which hold the blanks against the cutters.

135,935.—*Siphon.*—NATHANIEL W. PAYNTER, Baltimore, Md.

A siphon composed of a cylinder, piston, inlet and outlet passages arranged without valves, and in combination with a float or buoy for sustaining the lower end of long tube near the surface of the liquid to be drawn off.

Claim.—1. A siphon composed of the cylinder A, piston B, and inlet and outlet passages *c d*, arranged and operating together as and for the purpose described and represented.

2. In combination with the tube *f*, which forms a continuation of the inlet-passage *c* of the siphon, a float or buoy, *g*, for sustaining the lower end of said tube near the surface of the liquid to be siphoned off, as and for the purpose described.

135,936.—*Bosom-Pad.*—CHARLES A. PHILLIPS, Chicago, Ill.

The bosom-pad is supported on a frame made of one continuous piece of wire bent into a form adapted to the breast, and leaving an open space at the center of the frame.

Claim.—1. A bosom-pad provided with a supporting-frame, constructed substantially as specified.

2. As a new article of manufacture, a supporting-frame constructed of a continuous wire bent into a form substantially as shown and described.

135,937.—*Slop-Jar.*—WILLIAM S. POTWIN, Chicago, Ill.

The top or cover of the jar is formed of a single piece of metal by a die and drop, by which it is fitted to the top of the jar.

Claim.—The cover and breast made in one piece of sheet metal, in combination with a slop-jar, substantially as described, and for the purposes set forth.

135,938.—*Bale-Tie.*—MICHAEL QUIN, Galveston, Tex.

A square piece of metal has the edges of two and opposite sides turned and slotted above the bend, the notched band being held between the bends.

Claim.—The buckle, as constructed, in combination with the notched band, substantially as described.

135,939.—*Spindle for Spinning-Machines.*—DAVID H. RICE, Lowell, Mass.

The studs and collar prevent the live-spindle being raised from the dead-spindle in doffing. The rubber-packing tube not only holds the dead-spindle firmly, but absorbs or takes up any jar imparted to its upper end by the live-spindle, thus causing the latter to run steadily.

Claim.—1 The combination of the live spindle, provided with studs *a a*, with the bolster, provided with the collar *n* and slots *m*, substantially as described.

2. The dead spindle secured to its bolster by elastic packing or support, substantially as described.

3 The combination of the dead-spindle, secured to its bolster by elastic packing or support, with the live-spindle, supported independently at its lower end by the bearing *d*, substantially as described.

135,940.—*Soda-Fountain.*—WILLIAM H. RUSSEL, Sedalia, Mo.

The portion of the pipe which is connected with the counter-stand is provided with a piston, by operating which the soda-water is forced through the exit-pipe.

Claim.—A soda apparatus, consisting of the soda-reservoir, the counter-stand, the jointed pipe connecting the said reservoir and stand, the piston, and the exit-pipe, all combined and operating together as described.

135,941.—*Planing-Machine.*—THOMAS SHAW, Philadelphia, Pa.

The tool is placed in the end of a long bar, which is pivoted at its back end to a cross-bar placed on centers in the upright frame of the planer. Near the center of the bar a yoke is pivoted, from which a pin projects. This pin is fastened in the tool-post. Thus connected the tool end of the planer-bar has the motion of the tool-carriage imparted to it.

Claim.—The combination, as herein described, of the planer-bar *c* with the planing-machine.

135,942.—*Corn-Planter.*—JOHN SHEER, Lincoln, Ill.

The furrows are opened by runners, which also bear the seed-boxes. A rope is attached to one side of the field and passes around a reel upon the machine and secured to the opposite side of the field. The forward movement of the machine turns the reel, the crank-shaft of which in turn works the seed-valves.

Claim.—1. The reel C, consisting of the hub c^1, arms c^2 c^3 c^4 and forks c^5 c^6 c^7 c^8, so as to increase or diminish the circumference of the reel, substantially as described, and for the purpose set forth.

2. The combination of the reel C, shaft *c*, crank c^4, pitman D, shaft E, crank E', arms *e e*, and rods e^1 e^1 with the cord F and pulleys *f f'*, substantially as described, and for the purpose set forth.

3. The cam G, lever *g*, cord or chain H, pulleys *h h h'*, marker K, and grooved pieces *k k*, substantially as described, and for the purpose set forth.

4. The shaft N with the seed-channels *n n n n*, in combination with the plates L, M, and O, seed-slide I, piece P, and rod e^1, as shown and described, and for the purpose set forth.

135,943.—*Wire-Basket.*—DANIEL SHERWOOD, Lowell, Mass., assignor to E. P. WOODS, DANIEL SHERWOOD, and CYRUS H. LATHAM, same place.

The body of the dish or basket is made of open wound wire and the base of twisted wire.

Claim.—As a new and improved article of manufacture, a basket made of open wound and twisted wire, substantially in the manner described and specified.

135,944.—*Ring Rail and Holder for Spinning.*—GEORGE W. SPAULDING and WILLIAM T. CARROLL, Woonsocket, R. I.

The holder is made square, and fits in grooves in the rail, affording greater range of adjustment than usual.

Claim.—1. The rail A, constructed substantially as described.

2. The combination of the adjustable holder D, with or without the slot F, with the ring-rail A, substantially as described.

3. The adjustable ring-holder D, constructed as described.

135,945.—*Stay-Log.*—JOHN A. SQUIERS, New York, N. Y.

The stay-log is composed of two bars arranged between spur-wheels and braced by diagonal braces, which are adjusted by screws through the double spindle at the axis of motion.

Claim.—1. The expanding stay-log, consisting of its axial portion A and its outer portion B, in combination with the carrier-wheels H H, substantially as described.

2. The adjusting-screws N N, tapped through the journals of the axial portion of the stay-rod, in combination with the diagonal braces, and by which the said braces are tightened at any degree of expansion, substantially as shown and described.

3. The expanding stay-log A B, in combination with diagonal braces M M for trussing the same, substantially as herein described.

4. The combination of the log-carrier B with the carrier-wheels H H, by means of the recesses J J, into which the feet or end flanges of the log-carrier are fitted and secured, substantially as described.

135,946.—*Dinner-Pail.*—ROWLIN S. SQUIERS, Cleveland, Ohio.

The pail is constructed in three sections: The lower or lamp-chamber, the boiler, and the heating-chamber above the boiler. The chimney passes through the center of the boiler and the heating-chamber and through the cover. The boiler is also provided with a perpendicular tube that reaches nearly to the top of the heating-chamber.

Claim.—The sections A B, boiler D, tube E, and chimney H, combined with the heating device F, G, and K, all arranged substantially as and for the purpose specified.

135,947.—*Magazine Fire-Arm.*—ALFRED SWINGLE and FRANK A. HUNTINGTON, San Francisco, Cal.

Claim.—1. The breech-piece C, with its arms or trunnions *d*, in combination with the oscillating bar or lever *j* and trigger-guard H, substantially as and for the purpose described.

2. The oscillating breech-piece C, in combination with the magazine-tube G, when arranged substantially as described, whereby the cartridges may be fed directly into the breech-block and at the same time the old cartridge forced out.

3. The oscillating breech-piece C, magazine-tube G, bar or lever *j*, and trigger-guard H with its lever-arm K, connecting-rod *n*, and slide *o* having the claw-bar *p*, all constructed and arranged to operate substantially as herein described.

4. The slide *o*, with its upper wedge-shaped end, in combination with the recess *s* in the breech-piece for locking the breech-piece in the firing position.

135,948.—*Car-Coupling.*—JAMES TEMPLE, Danville, Pa., assignor of one-half his right to ROBERT P. BARKER, Chicago, Ill.

When the yoke is raised for coupling it is supported by studs projecting from the top plate of the draw-head. When the cars come together the "lash-plate" is struck and forced back against the yoke, which in turn is driven back from the studs and falls with the pin.

Claim.—1. In combination with a draw-head of the form and construction now in common use on railroad cars, the stirrup B', attached to the coupling-pin, with its saw-tooth catches *c'*, the projecting studs *c c*, and the sliding backlash-plate F, all constructed and arranged to operate substantially as described.

2. In combination with the said stirrup B', backlash-plate F, and studs *c c*, the guide-stirrup D, substantially as described.

3. In combination with said stirrup B', backlash-plate F, and studs *c c*, the cross-bars *c c* to support the link, substantially as described.

135,949.—*Ink-Pad.*—HENRY R. TOWNE and WARREN H. TAYLOR, Stamford, Conn.; said TAYLOR assignor to said TOWNE.

A cylindrical body, filled with a stuffing and covered by a flexible fabric clamped into a recess on its exterior, has a plunger actuated by a screw-nut, by which the ink, introduced through a proper aperture, is diffused over the whole surface of the casing.

Claim.—1. The combination, in an inking-pad, of a case provided with a flexible cover, an adjustable piston, and an elastic stuffing.

2. The combination, in an inking-pad, of the case A, piston B, nut C, flexible cover H, and elastic stuffing filling the interior space J.

3. In an inking-pad, the combination of the flexible cover H, the angular groove I, and the clamping-wire E, arranged substantially as and for the purposes described.

4. In combination with the subject-matter of the first claim, the induction-orifice closed by plug K.

5. The combination, in an inking-pad, of the several parts hereinbefore described—viz., the case A, piston B, nut C, flexible cover H, clamping-wire E, and elastic stuffing filling the space J.

135,950.—*Curtain-Fixture.*—HENRY L. TRAPHAGEN, New York, N. Y., assignor to himself and RUFUS N. PRATT, same place.

The rack is provided with a series of fixed teeth on each side of the slot, and combined with a slide carrying the cord-pulley at one end and an endless screw at the other end.

Claim.—The combination of the slide B carrying the pulley C and endless screw E with the rack A, furnished with the series of fixed teeth *f*, arranged on either side of its slot *a*, substantially as herein set forth, for the purpose specified.

135,951.—*Trace-Carrier.*—REUBEN H. WARRINER, Toledo, Ohio.

A bar or cross-piece connects the upper portions of the lateral parts of a trace-carrier and prevents the reins from falling down and becoming entangled with the hooks.

Claim.—In a trace-carrier, the connection A uniting the lateral portions of said trace-carrier, and forming a continuous upper surface to the same, substantially as and for the purpose shown.

135,952.—*Middlings-Purifier.*—EDWARD P. WELCH, Georgetown, D. C., assignor to himself, JAMES H. WELCH, ROSIA W. WELCH, HERBERT P. WELCH, and JAMES A. MALONY, same place.

Centrifugal action of the bolt, tending to discharge the middlings too rapidly over the "tail end," is retarded by jets of air issuing from a coil of perforated pipe surrounding the bolt, the meshes of which are kept open by brushes on vertical axes, revolving in a parallel plane.

Claim.—1. In a middlings-purifier, the combination of the rotary screen with a clearing brush or brushes rotating parallel therewith, substantially as set forth.

2. The combination, in a middlings-purifier, of the rotary screen with the encircling jet-pipe to counteract the centrifugal action of the screen, substantially as before set forth.

135,953.—*Middlings-Purifier.*—EDWARD P. WELCH, Georgetown, D. C., assignor to himself, JAMES H. WELCH, ROSIA W. WELCH, HERBERT P. WELCH, and JAMES A. MALONY, same place.

Air blown through perforated pipes, arranged at the sides and ends of the reciprocating shaker, clear its under side and the brushes (revolving in a plane parallel to the shaker on vertical spindles) of the fine adhering farina, &c. The air issuing from the end pipes prevents the too rapid discharge of the middlings over the "tail-end" of the shaker.

Claim.—1. The combination, in a middlings-purifier, of a vibrating screen through which a blast passes in one direction while the flour passes in the other, with a brush rotating across the face of the screen on an axis substantially perpendicular thereto, substantially as hereinbefore set forth, to produce a drawing action of the brush across the screen diagonal to its line of vibration.

2. The combination, in a middlings-purifier, of a vibrating screen, brushes rotating across the face of the screen, and a perforated air-pipe to direct streams of air upon the screen and brush, substantially as set forth.

135,954.—*Shovel and Spade.*—WILLIAM T. WELLS and GEORGE E. MORRHOUSE, Decatur, Ill.

Claim.—The corrugations or beads *c d* on the plates or straps C D, by which the blade of a shovel or spade is secured to the handle to strengthen the same at the junction of the blade and handle, substantially as shown and described.

135,955.—*Washing-Machine.*—JOHN WILBUR, Chesterton, Ind.

The improvement consists in connecting the segments holding the upper rollers by the link, and having independent vertical grooves and tongues, that each set of rolls may have an independent upright movement.

Claim.—The combination of the link *b* with the segments D D, the latter having independent tongues adapted to slide in vertical grooves, as described.

135,956.—*Staff-Gage for Dressing Millstones.*—LESTER B. WOOLVER, Mechanicsville, Ohio.

Staff-gage for giving a uniform depth to the channels or grooves of millstones.

Claim.—The herein-described staff-gage for dressing millstones, consisting of the staff A, having one side thereof slanting from one edge to the other, thereby making one edge thicker than the other, as described, and ears C C', arranged in relation to the staff A substantially as set forth, and for the purpose specified.

135,957.—*Permutation Lock.*—THOMAS B. WORRELL, Philadelphia, Pa.

Two spindles, arranged one above the other, serve to operate the lock. Upon the lower one a pinion is arranged so as to turn with the spindle, and also to slide thereon; and upon the screw of the upper one is fitted a carrier that connects with a sleeve attached to the pinion, so that by turning the upper or screw-spindle the carrier and pinion are moved back and forth on their respective spindles; thus the pinion is moved out and in gear with the combination wheels or tumblers and the rack-bar which actuates the bolts. The tumblers are supported and turn upon a hub, which surrounds the upper spindle, one side of which spindle is flattened to correspond with a flattened surface of the bore of the hub. By this arrangement every turn of the screw-spindle advances or retracts the pinion and elevates the tumblers by reason of the rounded part of it acting against the flattened part of the hub; the tumblers being adjusted and the bolts operated by means of the lower spindle.

Claim.—1. The screw-spindle D, in combination with the hub K, spur-gear E E', notched wheels F F', tappets G, carrier P, spindle L, pinion N, and its elongated hub O, for the purpose shown and described.

2. The screw-spindle D, in combination with the carrier P, spindle L, pinion N and its elongated hub O, for the purpose shown and described.

3. The combination of the actuating rack-bar R and the yoke S, for the purpose shown.

4. The dovetail projection on the dog W arranged to slide in a corresponding dovetail recess in the lock-plate B, for the purpose shown and described.

5. The rack-arm U^4 arranged to pass over the combination C, and secured to the bolt-head T, in combination with the rack-arm U, also secured to the bolt-head T and the pinions V V', for the purpose shown and described.

6. The false or idle wheel Y arranged to turn with the spindle D, for the purpose shown and described.

135,958.—*Machine for Lifting and Carrying Barrels, Boxes, &c.*—JOHN W. BABCOCK, Chicopee, Mass.

A lever-bar terminating in a hook with serrated edge, to which is jointed an adjustable rod provided with a similar hook, said rod being adjusted by a set-screw.

Claim.—The combination of the horizontal bar A A' and the arm E F with the rod H J, either or both adjustable, substantially as and for the purpose hereinbefore set forth.

135,959.—*Bread-Worker.*—JOSEPH H. BALDERSTON, Colora, Md.

The kneading is performed by two balls, which are attached to arms or bars moving horizontally in the dough-box.

Claim.—An improved dough-worker, formed by the combination of the standards B, shaft C, arms D, bars E, balls F, and lever G, with each other and with the slotted partition *a'* and box A, substantially as herein shown and described.

135,960.—*Spindle-Bolster.*—JAMES BARNES, Holyoke, Mass., assignor to himself and JAMES WOODHOUSE, same place.

Claim.—In combination with the cup A, designed to revolve with the spindle, the cap E, provided with an oil-receiving cavity on its upper side, and with the outer tubular extension F fitting in the rail, and the inner extension H forming the bearing for the spindle, said parts having the collar and flange K L, as shown and described.

135,961.—*Fly-Catcher.*—LEAVITT BARTLETT, Yarmouth, Me.

To a handle are attached two curved arms, and to these two journal-bearings, in which the journals of a hoop revolve as a support for a cup. The cup contains soap-suds, and is to be placed against the ceiling of a room in the evening when the flies are at rest, and they will fall into the suds and be destroyed.

Claim.—The combination of the stock A, arms *b*, hoop *c*, and bearings *c* with a cup or glass, as and for the purposes herein set forth.

135,962.—*Saw-Gummer.*—HENRY BAUGHMAN, Dorn's Gold Mines, S. C.

The saw-blade is adjusted on a pair of flanged eccentrics fastened to a cross-piece, and an emery wheel journaled in a swinging frame is pressed down by a handle on the frame. An adjustable guide on the side of the frame regulates the depth of the cut.

Claim.—1. The frame A, pivoted frame B b^1 b^2, rod C, emery-wheel D, shaft E, pulley G, and loose pulleys H, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purpose set forth.

2. The holder K, provided with flanged eccentrics L for holding the saw-plates while being operated upon by the emery wheel D, substantially as herein shown and described.

3. The combination of the adjustable guide or stop R with the frame A and pivoted frame B b^1, to limit the movement of the frame B and emery wheel E and make the teeth uniform, substantially as herein shown and described.

135,963.—*Sash-Fastener.*—RANSOM E. BECKWITH, Nashua, N. H.

The sash-lock heretofore patented to this party, (No. 133,916, December 17, 1872,) is additionally provided with a rotary latching-tumbler pivoted between the shanks of the two bolts, which project over it and have suitable locking notches. At its rear end this tumbler is notched to operate with a curved spring, which holds it in either of its positions. The tumbler has likewise a key-hole slot, and the insertion of a key, partially or more completely revolving the tumbler, serves as a means of locking either one or both bolts when either advanced or retracted.

Claim.—The combination of the rotary bolting-tumbler G, having its spring *g*, with the sash-fastener provided with the bolt-carrying projection B, (to extend into and make part of the parting-tongue of the two sash-grooves,) and with the two bolts D E having locking-notches *n e*, all arranged in the lock-case, and with respect to said projection B, substantially as specified.

135,964.—*Cultivator.*—JACOB BEHEL, Rockford, assignor to himself and GEORGE R. RICHARDSON, Earlville, Ill.

Claim.—1. The combination of the axle-tree B, the converging tongue-timbers C, the cross-brace D, the bracing-pendants E, and the brace-rods *d*, all these members being constructed and operating as set forth.

2. The combination of the perforated tongue, the elongated slot in the thimble *c*, the forked turning-shank A, the transverse locking-pins 1, and the neck-yoke H pivoted on one side of the axis of the shank, all these members being constructed and operating as set forth, to raise or lower the neck-yoke and tongue.

3. The combination of the pendants E, the sockets inclined downward and forward, the eyebolts *i* turning in the sockets, the drag-bar, and the plow-standards, all these members being constructed and operating as set forth, to cause the shovels to traverse a greater arc than the drag-bars, as set forth.

4. The combination of the drag-bar I, the long shovel-standard M swiveled thereto, the radius-yoke P swiveled to the standard, the radius-link P', and the detent-lever O and rack N, all these members being constructed and operating substantially as set forth.

5. The combination of the long standards M, their swivel-yokes R, and radius-links P' with the rod Q, all these members being constructed and operating substantially as set forth, to maintain the proper relation between the standards, while allowing them free adjustment in all directions.

6. The combination of the long standards M, the drag-bars I, the rigidly-connected shields T, the draft-chain *i*, the link-rods i^1, and the pivoted arms i^2 connecting the shield and drag-bars, all these members being constructed and operating substantially as set forth.

7. The combination of the socketed rings *l* on the standards with the rigid draw-rods l^2 inserted therein and secured by a frangible pin, these members being constructed and operating as set forth, to prevent bending or yielding of the draft-connections by back pressure on the standard.

135,965.—*Bed-Bottom.*—PETER BOESEN and MICHAEL BEDESEM, Kenosha, Wis.

The crossing braces connect the upper and lower frames, and are held at the ends by an inwardly-turned hook inserted in their notched ends.

Claim.—The inwardly-turned hooks and the notched braces combined with the spring bed-frame, as and for the purpose described.

135,966.—*Awning.*—JOHN BOYLE, New York, N. Y.

A rod is provided with sockets at its ends to which the brackets are attached. The rod is kept straight, and intermediate brackets dispensed with by the use of tension-rods, which pass through eyes on the sockets and are supported by a bridge or bridges on the main rod. The tension-rods are shortened or lengthened by means of nuts at one end.

Claim.—The application of tension-rods to awnings, substantially in the manner and for the purpose described.

135,967.—*Furnace for Melting Brass and other Metals.*—IRA D. BUSH, Detroit, Mich.

By turning the plate the grates are removed from the air-ports allowing the discharge of cinders and refuse.

Claim.—The rotary frame L, having grates with ports O P, arranged on a pivot, M, in furnace, as and for the purpose described.

135,968.—*Hat and Coat Hook.*—CHARLES G. COLE, Bennington, Vt.

A single piece of wire, or narrow ribbon of metal, is doubled near the middle and curved into suitable shape for a hat and coat hook. The free ends or prongs are sharpened to a point, bent angularly in the opposite direction, and forced into the wood, thus dispensing with other fastening devices.

Claim.—As a new article of manufacture, the hat and coat hook, made from a single piece of wire or strap metal, having at or near the middle a double, that is curved into a hook-form, and has the single ends turned in opposite directions, and provided with sharp prongs, as and for the purpose described.

135,969.—*Machine for Pricking Leather.*—GEORGE C. CONVERSE, Spencer, assignor to ABNER WHEELOCK, Charlton, Mass.

A series of awls attached to a head-piece are forced through the stock preparatory to being sided by hand. Suitable guides are provided for holding the stock in position; also a spring stripping-plate for freeing the leather from the awls after perforation.

Claim.—1. The combination, with head-plate G, of the perforating-awls A, stripping-plate J, and spring 5, substantially as and for the purposes set forth.

2. The combination, with the spring-arms C, of the perforated presser-plate *e*, substantially as and for the purpose set forth.

3. The combination, with table A, of the self-adjusting cross-

piece L, provided with holding-points 9, substantially as and for the purposes set forth.

4. The combination, with the levers K and end pieces E, of cams 7 and 8, substantially as and for the purposes set forth.

5. The combination, with the table A, head-plate G, and hinged end pieces E, of perforating-awls h, stripper-plate J, perforated presser-plate e, and gage-plates a, b, and f, substantially as and for the purposes set forth.

135,970.—*Iron Bridge.*—WILLIAM B. COOPER, Albany, N. Y.

The tubular sections of an iron bridge are united by a two-part shell, which is loosely inserted and afterward expanded by wedge-shaped keys. A firm union is thus produced without the expense of accurate turning and fitting, and the sections are made portable.

Claim.—1. The two-part shell B divided longitudinally and vertically, as and for the purpose described.

2. The key F combined with a shell, B, having the groove G and flanges E, as and for the purpose described.

135,971.—*Car-Ventilator.*—JOHN J. CROWLEY, Whistler, Ala.

A fan-blower driven by a belt from a pulley on one of the car-axles connects with two vertical funnel-mouthed pipes, which extend above the car into the open air. A horizontal pipe within the car connects these, and from its center a vertical pipe extends upward into a horizontal perforated pipe, which is placed in the highest part of the car and runs from end to end. Two valves, one in each funnel-mouthed pipe above the horizontal, are operated simultaneously by a connecting-bar in such manner that opening one will close the other, and will open a passage through the first from the open air to the blower, thence through the lower part of the other vertical pipe to the horizontal pipe, thence through the central vertical pipe to the perforated pipe, and out of this into the car. The object of the valves is that the fan may be operative when turned in either direction.

Claim.—The combination, in a railroad car, of the funnel-mouthed ventilating-pipes H I, conducting-pipes E F D C, distributing-pipe B, valves K, L, M, and N, and a fan-blower, substantially in the manner described.

135,972.—*Propulsion of Cars.*—RAPHAEL DE LEIDI, Brooklyn, N. Y.

The car is designed to be propelled forward upon the jointed track by alternately elevating and depressing one end thereof. The device may be useful as a toy.

Claim.—The sections A A^1 A^2, &c., pivoted to fixed, movable, or pendent supports B, and joined together to constitute a flexible track for the propulsion of vehicles, as set forth.

135,973.—*Seat for Chairs, &c.*—WILLIAM T. DOREMUS, New York, N. Y.

The seat is formed of several sectors, the angles of which nearly meet in the center of the seat. The sectors are hinged or pivoted to the seat-frame, and rubber springs are placed between the sectors and the frame, a little in front of the hinges.

Claim.—The combination, with frame A, of sectors B, provided with pivot-pins or hinges C and rubber springs D, near their outer ends, as and for the purpose set forth.

135,974.—*Oscillating Chair.*—WILLIAM T. DOREMUS, New York, N. Y.

The seat and the pedestal are connected by a bar at each side; said bars are pivoted to the seat and fastened to the pedestal by a nut screwed on their lower ends. Round rubber springs are placed upright between the seat and pedestals near the back part of the chair. The front part of the pedestals are provided with stops, and rubber stops are also placed between the seat and pedestals.

Claim.—The combination of the bars C, pivoted at their upper ends to the seat B, and connected at their lower ends with the pedestal A, the rubber springs D, the stops a', and the rubber stop-springs E, with the pedestal A and seat B, substantially as herein shown and described, and for the purpose set forth.

135,975.—*Fruit-Fork.*—ISABELLA C. DRAPER, New York, N. Y.

A cup is arranged just above the tines to catch the drippings when fruit is being served.

Claim.—The fruit-fork, provided with the bowl or cup B, substantially as herein shown and described.

135,976.—*Cut-Off for Fire-Plug Systems.*—FREDERICK W. EAMES, Grand Rapids, Mich.

A cut-off for service-pipes, closed at will by the engineer by increasing the pressure in the main and thus concentrating the force on the fire-plug, the cut-off apparatus having two pistons of different area controlling the induction and eduction ports.

Claim.—1. In combination with a street water-main, A, and the service-pipes B B' thereof, an automatic cut-off device, arranged to constitute a part of, and forming a through junction with, the service-pipe between the street main and the point of use for the water, essentially as and for the purpose described.

2. In an automatic water cut-off for street-mains, the combination thereof with a shell, C, having an upper and a lower chamber, D E, of unequal diameters, and an upper and a lower piston, F G, operating in connection with the induction and eduction pipes B B', arranged at different heights to cut off and open the connection of the service-pipe with the street-main.

3. In an automatic water cut-off for street-mains, the piston-shell C, open at both ends, and provided with a bow, L, to form a guide and stop to the ascent of the pistons, and also with an interior annular shoulder, M, to form a stop to limit the descent of the pistons, as described.

4. In an automatic water cut-off for street-mains, which operates by the pressure within the main, the combination of an upper and lower pressure-piston, F G, when the latter is made to serve also as a valve to open and close the service-pipe B', as described.

5. The solid piston-valve G, in combination with the induction and eduction pipes B B', arranged one above the other on opposite sides of the piston-shell C, the upper piston being of greater area and working above the upper pipe B, as and for the purpose described.

6. The lower-valve piston G of an automatic water cut-off, of a length to entirely cover the eduction-opening for the purpose of preventing the escape of the water already in the service-pipe when the latter is cut off from the street-main, as described.

7. The combination and arrangement of the open shell C, the pistons F G of different area, the weighted piston-stem H, the piston limit-stops L M, and the upper and lower branches B B' of the service-pipe of the street-main, the several parts being constructed, arranged, and operating substantially as described.

135,977.—*Car-Axle Box.*—CALEB T. FAY, San Francisco, Cal., assignor to THE JENSEN LUBRICATOR COMPANY, same place.

The oil-reservoir consists of a metallic box arranged to slide within the axle-box, and held in place by flanges upon the inside thereof. A gate, which is pressed down by the box-cover, enters within slots in the forward part of the reservoir, preventing the same from sliding forward.

Claim.—1. The lugs or points C C' for holding the box when in position, substantially as set forth.

2. The axle-box described, having the outside case with sliding cover F, removable reservoir A having slots D' D' and flange C', and gate or spring-bearer E, all constructed and arranged as described, for the purpose set forth.

135,978.—*Gas-Burner.*—THOMAS BURKE FOGARTY, New York, N. Y.

The flame is fed with an external supply of gas, the quantity of which is regulated by a tube movable within the burner and so situated that it can only be reached when the burner is detached from the supply-pipe.

Claim.—The construction of a burner, substantially as described, in which a supply of gas external to the flame is regulated around the base of the tip by means of an internal valve that can be operated only when the burner is detached from the pipe.

135,979.—*Gas-Burner.*—THOMAS BURKE FOGARTY, New York, N. Y.

The tip can be moved within the jacket by the pin. The revolution will open or close small apertures connecting the pipe with the chamber surrounding the tip.

Claim.—The interior movable tip d with perforated collar e resting upon the perforated ledge of the casing, when the parts are combined to operate in the manner set forth.

135,980.—*Gas-Machine.*—THOMAS B. FOGARTY, Warren, Mass.

The air-supply pipe communicates with the exterior of the gas-house, and is provided with a register, and a valve which is constructed with an independent stem and is arranged to regulate automatically the supply of air. The flow of gasoline is also regulated by means of a drip, which opens or closes a valve in the pipe leading from the gasoline-reservoir.

Claim.—1. The air-injector or back-pressure valve A of carbureters or gas-machines, constructed and operated substantially as set forth.

2. The air-register C of carbureters or gas-machines, constructed and operated substantially as set forth.

3. An air-pipe, D, communicating between the outside of the gas-house and the air-injector or back-pressure valve of a portable gas-machine, substantially as set forth.

4. The combination of a drip, N, cock K, and lever P, constructed and operated substantially as described.

135,981.—*Carbureter.*—THOMAS B. FOGARTY, Warren, Mass.

The valve is operated by means of a cam in such a manner that, by a slight movement in the same, the valve will be completely opened or closed.

Claim.—In automatic regulating carbureters or gas-machines, a gasoline-supply valve, constructed substantially as described.

135,982.—*Carbureter.*—THOMAS B. FOGARTY, Warren, Mass.

A rock-shaft is arranged to be operated by the gas-holder and by a float within the same, so that when the gas-holder is inflated to a certain point, or when the gas is withdrawn and the holder falls to a certain point, it operates the rock-shaft and causes it to disengage its hold upon the weighted valve-lever, which immediately drops, and thereby shuts off the flow of gasoline to the generator.

Claim.—1. The float L and rock-shaft J, suitably connected, in combination with the weighted lever N, as and for the purpose specified.

2. The gas-holder A and the rock-shaft J, suitably connected, in combination with the weighted lever N, as and for the purposes specified.

3. In combination with the gas-holder A, the rods I and O, the pipes E and K, the float L, and the weighted lever N, constructed and operated substantially as described.

135,983.—*Medical Compound or Rheumatic Ointment.*—JOSEPH GROMEN, New York, N. Y.

Prunes, oil of cedar, chloride of sodium, sal-niter, juniper berries, water.

Claim.—The ointment for the cure of rheumatism and similar diseases, substantially as above described.

135,984.—*Car-Coupling.*—JOHN W. GILLAM and JOHN W. GILLAM, Jr., Newton, N. J.

A flat-bottom coupling-bar having catch-shoulders on the upper side of its ends, with a mid-rib between them, which engages with a spring-pressed cross-bar working in slots in the draw-head, and having a notch in the middle thereof corresponding to the rib on the coupling-bar. This rib prevents the catch-shoulders from engaging with the rim of the draw-head when the cross-bar is raised.

Claim.—A flat-bottomed coupling-bar, E, having catch-shoulders on upper side of ends with mid-rib J between them, in combination with a spring-pressed cross-bar, B, having notch in the middle thereof, arranged to operate as and for the purpose described.

135,985.—*Grain-Binding Harvester.*—CHARLES F. GODDARD, St. Ansgar, Iowa.

The rake reciprocates from end to end of the grain-platform, sweeping the cut grain to the stubble-side of the machine, and in position to be bound by mechanism which is operated by the movement of the rake.

Claim.—1. The combination of the arm or frame D, rod F, wheel G, lever I, and connecting-rod J with the platform B, tongue E, and drive-wheel C, substantially as herein shown and described, and for the purpose set forth.

2. The arm H' h^1, cross-head O', and hook P^c combined with rake-head F' having hook B, and slide E having pin o', substantially as herein shown and described, and for the purpose set forth.

3. The combination of the pivoted spring-guide S' and incline U' with the lever K and cross-head O' to control the movement of said cross-head as it revolves, substantially as herein shown and described, and for the purpose set forth.

135,986.—*Barber's Chair.*—PHILIP HABERSTICH, Dayton, Ohio, assignor of one half his right to CHARLES MIKINAS, same place.

The seat and back are reversed by means of a combination of treadles, cords, and pulleys, and are fastened in position by a combination of levers and slides. The inclination of the back is regulated by a supporting-fork resting on a cog-rack, which slides in an upright beam and is locked by a foot-lever.

Claim.—1. A barber's chair with seat and back reversible by means of a combination of the treadles y y, cords A, fixed pulleys t and D, and movable pulleys E E, as described.

2. The fastenings of said reversible seat and back by a combination of the levers u u, slides w w, clutches z z, and the double slides G G, connected by pitmen to cranks F F and crank-shaft V, as described.

3. The back, whose inclination is regulated by supporting-fork T, resting on a cog-rack, K, which slides in beam P, and is locked by mortised foot-piece Q, as described.

135,987.—*Kite.*—CHRISTIAN J. HARDEKOPF, Philadelphia, Pa.

The kite is capable of being disjointed and folded into a small bundle. There is a central upright support in two pieces, joined by a socket-joint. Two curved cross-pieces are joined to the central support, their ends having grooves to fit the edge of upright support, and which ends lie in between blocks of wood attached to the upright support. A cord is placed around the frame in grooves made on the extremities of the central support and on the cross-pieces. The covering is made of linen, silk, &c., and rendered weather-proof by varnishing, and it is attached by pins to the cross-pieces.

Claim.—1. The combination joint *f f e n g* at the upper part of the upright supports.

2. The frame in its perfect construction.

135,988.—*Mechanism for Operating and Feeding Oil-Well Drills.*—GUSTAVUS A. HINCKLEY, Pit Hole, Pa.

The peculiar construction of the temper-bar enables the operator to turn either the feeding-screw alone or the whole apparatus, as occasion requires, by shifting-weights at the ends of lines run through sheaves and attached to the ends of the levers governing the pawls.

Claim.—1. The supporting rod or shaft D, the tubular screw A, its nut C C, and the ball B, arranged and applied lengthwise, substantially as shown and described.

2. The combination of the ratchets *g k*, double pawls *i m*, and pawl-carriers A *l* with the suspension-rod D, the tubular screw A and its nut C C, and the ball B, all being arranged and applied together substantially as specified and represented.

135,989.—*Bed-Bottom.*—BENJAMIN HOLMES, New York, N. Y.

The springs are double conical. An intermediate frame, with cross-slats, supports the springs centrally, the central coils being fastened above and below to the edge of the slats by a web-strap.

Claim.—1. The arrangement of the springs A in regard to the slats D, substantially as shown and described.

2. The straps or fastenings C, in combination with the spring A and slat D, as and for the purpose described.

135,990.—*Pocket-Book.*—WILLIAM HENRY KING, Westbury, England.

Claim.—As a new article of manufacture, a bill-case with two closing flaps, a a', double partitions c, plaited ends e, and spring-straps *f f'*, arranged as described.

135,991.—*Ratchet-Pinion.*—JOHN F. KINGWILL, Chicago, Ill.

Loose pinion-wheel having eccentric pawls operating on opposite sides to preserve the center and position of the wheel in operation, and permit the shaft to turn freely in the opposite direction.

Claim.—The combination of the stops or keys C, attached to and supported by the pinion, with the loose pinion A and angular shaft B, substantially as and for the purposes specified.

135,992.—*Combination Padlock.*—JOSEPH KITTLE, East Bend, N. C.

The index-rods have a rotary motion, and are held within the lock-case by a stationary rod which engages in annular grooves therein. The staple is held in the locked position by means of the index-rods, which fit into notches in the said staple. The index-rods are also provided with notches, which must be properly adjusted before the staple can be withdrawn.

Claim.—The combination, with rod F and notched staple C, of the index-rods E G, annularly grooved to receive the former, and transversely notched to allow the latter to operate therewith, as described, and for the purpose set forth.

135,993.—*Horseshoe-Nail Machine.*—JOSEPH M. LAUGHLIN, Boston, Mass.

This machine is an improvement on that patented to E. W. Kelley, May 23, 1871, and consists in constructing the feeding devices with two projecting arms, between which the clamping-jaws pass, and which, by means of an upper spring and four side springs, guides the nail centrally and retains it in that position until the jaws close. Two pieces are also fixed at the foot of the stationary jaw, between which the nail-head rests.

Claim.—1. In combination with the wheel A and dies B C, the employment and use of the guide-pieces *b b* on each side of the die B, in a manner and for the purpose set forth.

2. The construction and arrangement of the tube G, curved guides H H, with their springs *h h' i i' i' i''* or their equivalents, in combination with the rotating dies B C, as and for the purpose set forth.

135,994.—*Vibrating Propeller.*—CHARLES P. MACOWITSKY, Corpus Christi, Tex.

A sliding frame on the bottom or sides of a vessel, operated by a piston-rod, has pivoted to it vibrating floats. These floats have on their upper edges pinions, which mesh into a rack-plate which slides on top of the frame, and is limited in its horizontal motion by stops. This rack-plate is adjusted to regulate the inclination or feathering of the floats by a screw-bolt, which passes through studs on its top and through an upright bar connected to the sliding frame, and the relative position of the screw-bolt and piston-rod is maintained by gearing on each. Thus the floats can be operated to propel the vessel forward or backward.

Claim.—The combination of the arm B, block or plate C, plate or frame D, rack-bar E, pinion-wheels F, pivoted paddles G, stops H and I, and swiveled screw J with each other and with the screw piston-rod A of a steam-cylinder, substantially as herein shown and described, and for the purposes set forth.

135,995.—*Fertilizer.*—JOHN MCDOUGALL, London, England.

An acid phosphate of lime is formed by adding sulphuric acid to the phosphatic substance. This is mixed with a light porous material and ammoniacal gas passed through the mass, forming precipitates, phosphate of lime and sulphate of ammonia. Sulphuric acid is then added to render the matters soluble.

Claim.—1. The absorption of ammonia contained in gases or vapors arising from the destructive distillation of carbonaceous or ammoniacal substances, or from gas liquor or other ammoniacal liquors resulting from such destructive distillation, by the employment of an acid superphosphate of lime, for use as a manure.

2. The addition of sulphuric acid to the product, as above obtained, for the purpose of rendering the phosphate again soluble.

135,996.—*Steam-Generator.*—PATRICK J. MCMAHON, New Orleans, La.

A steam-generator having a water-reservoir attached by a pipe from the steam-chamber to the bottom and within the reservoir, perforated the entire length of said reservoir. Also, a pipe from the steam-dome of the reservoir to a superheater placed within the up-take of the generator, whereby the steam is superheated and an equability of pressure is maintained in the generator and reservoir.

Claim.—1. The combination of the boiler A, superheater B, and reservoir D, when constructed and arranged substantially as described.

2. The steam-pipe I, perforated at its lower end, when arranged with the boiler A and reservoir D, as shown, and substantially as described.

3. The combination of the boiler A, superheater B, reservoir D, and steam-cylinder G, arranged as described.

135,997.—*Cultivator.*—JAMES MILLS, Johnstown, Wis.

The bars which spread apart and contract the plows are pivoted at the axle and connected at the top by a pivoted bar. The lower ends of the levers work loosely in slotted plates on the plow-beams, so as to allow a free vertical independent movement of the same.

Claim.—The combination of the upright levers G G, the lower ends working in slotted plates attached to the shovel-bars E E, with fulcrum at the axle, and adjustable cross-bar L at the top to spread and contract the shovel-bars, substantially as described.

135,998.—*Engraving and Carving Machine.*—THOMAS W. MINTER, New York, N. Y.

The machine is an improvement upon the patent granted October 29, 1872, by connecting the tilting tables, tracing point, and cutters in a compact and simple manner.

Claim.—1. The tilting platform E applied to the longitudinal carriage B of an engraving-machine, substantially as and for the purpose herein shown and described.

2. The slotted segments h applied to the pivoted platform E

for connecting the same with the supporting-slide B, substantially as specified.

3. The nut *d d* on the carriage B, when applied substantially as specified.

4. The screw H for moving holders G in the tilting platform E, when hung in said tilting platform to adapt itself to the movements thereof, as set forth.

5. The combination of the longitudinal screws C and H with the carriage B, platform E, and disks G G, substantially as herein shown and described.

6. The beam J, made longitudinally and vertically adjustable, as set forth.

7. The swivel-frame I, arranged to receive and support the tool Z, as set forth.

8. The connecting-rod e^3, arranged between the swivel-frame I and swivel-pin N or N^1, as set forth.

9. The combination of the frame I directly with the beams J, as in Fig. 4, and as described.

135,999.—*Machine for Desiccating Tan.*—CHARLES H. MOSELEY, Winchester, Mass.

An endless apron feeds the tan upon a spreading-roller, which distributes it over an inclined perforated plate toward heated presser-rollers, passing through which it falls upon an inclined delivery-chute having a heating-chamber beneath it.

Claim.—1. The combination of a feed-roller, E, plain or grooved, and curved apron or strainer F, essentially as described, with the endless delivery-apron B, or its equivalent, and the expressing-cylinders G H, all being arranged and to operate substantially in manner as shown and set forth.

2. In the tan-desiccating machine, the chute L, as provided with the heating-chamber M, arranged under and against it, as and for the purpose explained.

136,000.—*Torpedo.*—CHARLES NELSON, East New York, N. Y.

The fulminate is inclosed in a small sack and deposited in a well formed in the bottom of the torpedo, beneath the powder-filling.

Claim.—1. A torpedo in which the fulminate is arranged in the center of the wrapper A, separate from the other filling, and either enclosed or not in one or more pieces, B, of strong paper having a hole, C, at the center, and all folded, twisted, and pasted together, substantially as described.

2. A torpedo, as described in the foregoing clause of the claim, having an outer covering of tissue or other colored paper, substantially as specified.

136,001.—*Machine for Cutting Stone.*—CHRISTOPHER E. ODGERS, Bloomfield, N. J.

An arrangement of bars and lifting-screws upon the carriage, to present the stone to the cutters at any desired angle.

Claim.—1. The combination, with carriage-frame and platform P, of bar M, screw N, nut in cross-bar L, and hinged bar O, arranged as and for the purpose described.

2. The plate Q, secured to side bar K and having a slot curved in the arc of a circle whose center is the axis of the hinge that connects bars O and M, as and for the purpose specified.

136,002.—*Pulp-Strainer.*—HENRY H. OLDS, New Haven, Conn.

A half-cylindrical wire strainer attached at its end and top to the frame, which is covered, and a hopper attached by hooks. A shaft is passed through the frame and through a cylinder, to which is connected elastic wings, arranged in spiral form on its surface.

Claim.—The elastic wings J, cylinder E, and strainer A, combined and arranged to operate substantially as shown and described.

136,003.—*Sulky-Plow.*—WILLIAM OUGH, Orion, Ill.

A plate is pivoted to the frame and carries the wheel-spindle. The side opposite the pivot moves in a circular slot in another plate, and is made fast thereto by a latch at any desired height to regulate the depth of the plow.

Claim.—The plate G, pivoted to plow-frame D, receiving-wheel on a pin, *g*, and provided with a lever, H, in combination with arc-slotted and notched plate *j*, and lock mechanism *i l m*, substantially as and for the purpose described.

136,004.—*Device for Cutting Pipe, &c.*—ANDREW J. PENNOCK and THOMAS A. CHANDLER, Rockford, Ill.

Claim.—1. A ratchet-wrench constructed substantially as set forth, with a rotating tubular body slotted longitudinally to permit of the insertion of a pipe sidewise.

2. The combination of a tubular body, an adjustable cutter, and a feed-screw or its equivalent acting upon the cutter, these members being constructed and operating in combination, substantially as set forth, to advance the cutter as the cut deepens.

3. The combination in a ratchet-wrench of a rotating body, carrying an adjustable cutter and a feed-screw, with a rotating handle, and a rack upon it, these parts being constructed and operating substantially as set forth, automatically to feed the cutter.

4. The combination in a ratchet-wrench of a longitudinally-slotted rotating tubular body with a die-plate movable transversely in a groove in the walls of the slot, substantially as set forth, securely to hold the die-plate, and yet admitting of its ready removal or replacement.

5. The combination in a ratchet-wrench of a rotating tubular head with clamp-plate adjustable transversely therein, substantially as set forth, to adapt the implement to nuts of varying sizes.

6. The combination in a ratchet-wrench of a rotating longitudinally-slotted tubular body with handles having longitudinally-slotted heads, these members being constructed and operating substantially as set forth, so that a pipe or similar article may be inserted sidewise and then encircled completely by the implement.

136,005.—*Hat and Coat Guard.*—SUMNER N. ROBBINS, New York, N. Y.

Two metallic hooks are bent in U-shape, to one of which is attached a small spring-bolt lock, while the other has a T-shaped extension engaging with the lock. One of these hooks is slipped over the inside lining of a hat, and when the device is locked an angle is formed corresponding somewhat to the shape of the body of the hat. There is also a short guard-chain connecting the two hooks for placing around an overcoat, umbrella, or the like articles, securing them, as well as the hat, in locked position.

Claim.—The U-shaped hooks B C, the latter having a T-shaped apertured extension, *d*, the spring-bolt lock D, and the guard-chain E, combined as and for the purpose described.

136,006.—*Gas-Lighting Torch.*—CHARLES H. ROBERTS, Troy, N. Y.

The perforated tube with a bell-mouth serves as an inlet for the gas. The gas passing through the tube is ignited at the lamp attached to the torch, the flame following the stream of gas back to the burner.

Claim.—The perforated tube B provided with a cup-shaped outer end and attached to a staff, A, to conduct a stream of gas from the burner to be lighted to the flame of a lamp or taper, C, also attached to said staff A, substantially as herein shown and described, and for the purpose set forth.

136,007.—*Valve for Gas-Regulators.*—JOHN C. SARSFIELD, New York, N. Y.

The inner tube, flanged at its upper end to form the valve-seat, has on the lower end two sets of notches of different depths, into either of which the cross-bar may fit. To this cross-bar the valve-stem is attached by means of a spiral spring.

Claim.—1. The tube C, notched at c^1 c^2, and the cross-bar G combined with the spring of valve-stem E and valve D, as described, so that the cross-bar may be changed in its position and thus change the tension of spring.

2. The tube C, provided with a valve held to the cross-bar by a spring combined with the parts A B, constructed and applied thereto, as and for the purpose set forth.

136,008.—*Oil-Still.*—EMIL SCHALK, New York, N. Y.

The still is provided with an opening through it from side to side for the passage of the flame, and with a series of vertical tubes connecting the upper and lower chambers of the still so that a circulation of the oil is obtained and any impurities are deposited in the lower chamber.

Claim.—1. A still for securing the distilled products of petroleum, consisting of the retort A, having the large passage B from side to side, the lower chamber C, the upper chamber D, vertical chambers E E, and the vertical tubes F, all arranged as set forth.

2. The vertical tubes F, arranged and applied to a still, as and for the purpose set forth.

136,009.—*Barber's Chair.*—ADAM SCHWAAB, New York, N. Y.

The arms are provided with elbows that incline downward toward the back legs, and have ratchets on their inner edges. Into the lower part of the back is introduced an arrangement of springs and levers controlled by a handle projecting at or near the bottom of the back. The ends of the levers engage with the ratchets on the arms of the chair.

Claim.—1. The construction of the arms C with elbows D, in connection with legs *b* and ratchets *g*, as set forth.

2. The combination of the pivoted back B with the elbows E and ratchets *g* by means of spring and lever arrangement *e*, substantially as described.

136,010.—*Process of Polishing Wood.*—CHRISTIAN SEEBACH, New York, N. Y.

The compound is applied with a brush, and is rubbed down so as to fill and close the pores of the wood to be polished and varnished.

Claim.—The application to wood surfaces, which are to be polished with shellac and varnish, of a preliminary coating formed of plaster, paint, and turpentine, prepared and applied as described.

136,011.—*Car-Coupling.*—JOHN R. SUCCOP, Birmingham, Pa., assignor of two-thirds his right to JOHN KERIN and WILLIAM SUCCOP, same place.

The boxes in which the links are pivoted are moved backward and forward in the draw-head by means of shafts extending to the sides of the car, and by these shafts the link is elevated or depressed to suit the height of the approaching car.

Claim.—1. In a car-coupling, the combination of an ordinary coupling-link and a sliding lifting-shaft, to which the inner end of the link is rigidly secured, substantially as specified.

2. The combination of the link D, lifting-shaft E, and sliding boxes F F', substantially as and for the purpose specified.

136,012.—*Knitting-Machine.*—EDOUARD TAILBOUIS and AMBROISE RENEVEY, St. Just-en-Chaussee, France, assignors to JOSEPH FREEMAN, Windsor Locks, Conn.

For knitting welts, fancy stitches and fabrics, tucked, striped, and plaid fabrics, &c.

Claim.—1. The combination, with the two sets of needles, of a thread-guide for the horizontal needles advanced beyond the position for feeding both sets, the cam *i* and the cam *w* having notch *n*, substantially as and for the purpose specified.

2. The combination, with the adjustable piece z^2, of a spring-actuated pusher, h^1, substantially as specified.

3. The combination, with the adjustable piece z^2, of a catch, l', substantially as specified.

4. A secondary cam or tappet, w^2, arranged with the cam-groove for the vertical needles, substantially as specified.

5. The combination of the needle-jacks N N', cams *w*, Y, Z, and *a*, and comb-disk P, substantially as specified.

6. The needle-jacks N N' having the differential projections *t u*, in combination with the cams *w x*, whether said projections are arranged alternately or otherwise, substantially as specified.

7. In a machine comprising the two systems of needles herein described, the combination, with the horizontal needles, of the cam *w* having the notched portion *n*, cams *i* and *a'*, and a feeder, *h*, arranged in such relation to the vertical needles as to deliver the yarn in advance of the vertical needles, substantially as specified.

8. In a machine comprising the two systems of vertical and horizontal needles, the combination with the said horizontal needles and the cam *w* having the notched part *n* of the cam *a'*, substantially as specified.

9. The arrangement of the slides Z^1 and levers Z^2 with the shaft Q and cams Y Z, substantially as specified.

136,013.—*Railway-Dust Preventer.*—JOHN WELLEY, Fredericktown, Canada.

A triangular frame is attached to the sides of the car, and extends downwardly outside of the wheels. A canvas screen is combined with the frame, and may be wound upon a roller, which is secured to the top of the frame.

Claim.—A triangular frame, F, provided with roller to receive flexible screen, and applied as and for the purpose described.

136,014.—*Nail for Attaching Soles to Boots and Shoes.*—WILLIAM WICKERSHAM, Boston, Mass.

Claim.—A wire for attaching soles of boots and shoes, having indentations and prominent portions around it, making a succession of larger and smaller diameters, having its larger diameters terminate in definite angles, as described, and its indentations either rounded or terminate in an angle, all substantially as described, and for the purpose set forth.

136,015.—*Screw-Propeller.*—MARTIN M. WILSON, Honey Grove, Tex.

Propeller wings or blades are pivoted on a shaft, and are connected by movable rods to a collar, which travels longitudinally on said shaft. The movement of this collar controls the expansion or contraction of the blades, according to the amount of resistance brought to bear upon them, and tension is maintained by a spiral spring around the shaft and located between the collar and the hub or boss, while a set-nut regulates the pressure of the spring.

Claim.—1. The blades I, pivoted to the radial shaft-arms, in combination with the sliding collar M, connected thereto by rods L, as and for the purpose described.

2. The combination, with slide M connected by rods L with pivoted blades I, of the spiral spring O, arranged upon propeller-shaft between said slide and the nut D, as and for the purpose described.

136,016.—*Horse Hay-Fork.*—GEORGE ATHERTON, Sparta township, Kent county, Mich.

One of two arms, crossed and pivoted, has its upper end slotted and terminated by hooks turned upward, between which a locking lever is pivoted having a hook turned downward, the opposite end of which lever is bifurcated and locked in position by a pin attached to a spring on the arm.

Claim.—The combination of the levers A A', locking devices B *g* Z, rope F, and tines K, when arranged to operate substantially as described.

136,017.—*Reverberatory Furnace.*—GEORGE ATKINS, Youngstown, Ohio.

A vertical closed feed-chamber extends above the crown of the furnace, and is so arranged relatively to the grate and fire-bridge that the feed will be continuous, and gases generated from the fresh fuel will be compelled to traverse the incandescent fuel, becoming highly heated before ignition.

Claim.—The closed fuel-chamber extending above the crown of the furnace, in combination with the grate B and fire-bridge E, substantially as described.

136,018.—*Type-Setting Machine.*—WILLIAM H. BALDWIN, New York, N. Y.

The lowermost type in a "stack," A, is delivered to a conveying mechanism by an ejector-plate on the end of the armature-lever of an electro-magnet. On depressing the proper key the circuit is broken and the armature released to vibrate the ejector.

Claim.—The combination, with the series of type-stacks, of the circuit-breaking keys, electro-magnets, armature-levers, ejector-plates, and connecting-wires, substantially as and for the purposes specified.

136,019.—*Railroad-Car Brakes.*—FRANCIS G. BATES, Springfield, Mass., assignor to THE AMERICAN CLUTCH COMPANY, Middletown, Conn.

A flanged disk is secured to the axle, into which is fitted a divided ring, which is opened by means of levers arranged about the axle and within the ring. A wedge-shaped rod, operated by a rod passing from car to car, engages between the levers and opens the divided ring so that it comes in contact with the inner surface of the flange upon the revolving disk.

Claim.—1. In combination with the flange A formed upon or revolving with the wheels, and the divided ring B and levers *d d* and bar F, the plate D, constructed with projecting lugs N, and the braces L L, whereby the said ring, levers, and plate are held stationary, substantially as described.

2. In combination with the subject-matter of the first clause of claim, the rod G, with its crank or cranks *f*, in connection with the said rod F, for the purpose of operating the same, substantially as set forth.

136,020.—*Hoe.*—NORVAL D. BENCROFT, Bangor, Me.

A thin narrow and horizontal blade, supported at both ends by upright cutting-arms, which are adjustably attached to a frame supported at the forward end by a single wheel, constitutes the implement.

Claim.—The combination of the wheel *a*, handles *b b*, and hoe-blade *c*, secured, substantially as described—to wit, by plates *f f* and A, pivot *g*, and bolt *e*—to a vertically-adjustable standard, *d*, all operating substantially as set forth, for the purposes specified.

136,021.—*Vapor-Burner.*—JOSEPH BENSON and ALBERT H. WATKINS, Boston, Mass.

The heating-flame issues from the aperture and passes through the perforated wing and surrounds it, thereby more effectually heating the wing and adjacent parts. The hood protects the flame from drafts.

Claim.—The perforated wing H, coupling-sleeve E, and feed-tube F, in combination with the hood J, sleeve K, opening *f*, burner-tube A, chamber *c*, and the tube *b* or chambered sleeve M, substantially as described.

136,022.—*Vapor-Burner.*—JOSEPH BENSON and ALBERT H. WATKINS, Boston, Mass.

Beneath the burner is placed a cup-shaped disk, which prevents extinguishment of the supplementary flame. This flame is fed with gas issuing through a small opening in the vaporizing-chamber, and serves to aid in the vaporization.

Claim.—The burner-tube, having the vertical chamber *c* communicating at its upper end with the tube A by the aperture *d*, and at its lower end with the double conical-shaped supplemental chamber F by the aperture *f*, as herein described, in combination with the jet-hole *b* and the cup-shaped disk D, having the inwardly-flaring edge *s* and sleeve E, the several parts constructed, arranged, and operating in respect to each other, as herein shown and set forth.

136,023.—*Lemon-Squeezer.*—ARTEMAS BIGELOW, Killingworth, Conn.

A cup-shaped body, formed with an opening to receive the half-lemon, with its handle, open at its sides for the passage of the juice, to which is fitted a corrugated follower with a handle, which, when brought together forcibly, the juice of the lemon is forced out.

Claim.—1. The cup *a* provided with a handle, *b*, substantially as set forth.

2. The cap, in combination with the screw *c*, substantially as described.

136,024.—*Water-Regulator.*—JAMES P. BOLIN, Orangeburg county, S. C.

Gates of different sizes are pivoted above the mill-breast. The small gate opens first, when, if the discharge is not sufficient and the water continues to rise, the gate next in size opens. As the water falls the gates close in the same order.

Claim.—The gates A A A, of different sizes, hinged or pivoted between the posts C above the mill-breast bottom H, all constructed and arranged to operate substantially as and for the purpose herein specified.

136,025.—*Metal-Coated Ware.*—GEORGE BOOTH, Philadelphia, Pa.

The object is to fill up the places where the metal is strained by deep stamping and prevent corrosion there, and to give a crystalline-surface finish to the article.

Claim.—The article of coated ware herein described, formed by stamping, and afterward zincing, substantially as herein set forth.

136,026.—*Broom-Bag.*—EDWARD D. BRONSON, Amsterdam, N.Y.

A paper-bag having a bottom composed of wings folded over and secured by means of hooks and eyes.

Claim.—The broom-head cover, consisting of the paper bag A having an open bottom, with wings *a b* folded over and secured by means of hooks and eyes, substantially as specified.

136,027.—*Harrow.*—WHITMAN BROWN, Butte Des Morts, Wis.

A rotary harrow suspended between two bearing-wheels by means of a standard which passes up through the axle. The harrow is rendered vertically adjustable by means of levers secured to a platform above the axle. To the lower ends of metallic bars, secured to the standards, are fastened friction-rollers. The one in the rear is to depress the harrow and prevent the forward end from dipping, while those at the sides are to cause the harrow to have a continuous rotary motion by depressing either side.

Claim.—1. The bars *f f*, as constructed, having friction-rollers *i i* upon their ends, when used in combination with a regulating-lever and the top plate of the harrow, as and for the purpose set forth.

2. The combination of the adjustable bar *f'*, provided with a friction-roller, with the plate G and standard J for regulating the rear of the harrow, as is herein fully set forth.

136,028.—*Potato-Digger.*—ADDISON G. BRUSH, Susquehanna Depot, Pa.

Constructing potato-diggers with teeth and handles, having eyes formed in one end, and rendered adjustable by means of wedges. The bar to which the teeth and handles are attached is curved at both ends to admit of its being rocked. It is also pro-

vided with chains, by means of which it is drawn. To the chains is attached a bar for clearing the vines away in front of the teeth.

Claim.—1. The improved potato-digger, having the head A with its ends bent forward, and holding the adjustable tines B, substantially as specified.

2. The adjustable tines B, in combination with the head A and wedges *d*, substantially as described.

3. In a potato-digger, the adjustable handles *a*, having the elongated depending arms *a'*, and applied to the head A, substantially as specified, and for the purpose set forth.

4. The vine-clearer L, connecting and supported by the chains K, substantially as specified.

136,029.—*Apparatus for Elevating and Unloading Hay.*—HENRY BUCK, Polo, Ill.

Claim.—The conveyer, constructed of the timbers E E U and the sheave-block N N, in combination with buffers and springs arranged upon the tracks A A, substantially as and for the purpose set forth.

136,030.—*Curtain-Fixture.*—CHAUNCEY BUCKLEY, West Meriden, Conn.

The bracket that supports the curtain-roller is constructed with an elongated bearing, within which the pivot works. The bracket is also provided with a stud, which, when the pivot is at one extreme of the elongated bearing, engages the ratchet-wheel; but the elongated bearing allows the drawing of the roll and ratchet-wheel so far from the said stud that the roll may revolve without the engagement between the stud and the ratchet. The cord-pulley is secured to a short wood roller, which is inserted in a sheet-metal tube that forms the body of the roller.

Claim.—1. The bracket A, constructed with an elongated bearing, *a*, and projection *n*, combined with the toothed wheel *b* attached to the roll, substantially as and for the purpose described.

2. In combination with a curtain-fixture adapted for rolls, the tube N and block L, substantially as and for the purpose specified.

136,031.—*Apparatus for Lowering and Sinking Shaft and Well Tubes.*—JOSEPH CHAUDRON, Brussels, Belgium.

The diaphragm is made of inverted form to better resist strains. It may be made smaller than the tube flange, and temporarily retained by the intermediate ring, which, when removed, allows it to be withdrawn.

Claim.—The equilibrium-tube I, attached to an inverted disk-shaped diaphragm, G, capable of being secured to and lowering the cylindrical casing for shafts, pits, &c., substantially as described, whereby a communication is obtained between the top and bottom of the shaft, for the purpose specified.

136,032.—*Hat-Rack.*—NICHOLAS CLARKE, Boston, Mass.

A main or center piece having extending from it a series of arms, each jointed to the main piece at its inner end and swinging upon its pivot-pin. From the front of each arm, near its outer end, extends a supporting peg or hook. The arms are retained in an extended position by suitable chains or stops.

Claim.—The hat-tree, made with the arms *c* pivoted to the head and center piece *a*, and arranged substantially as shown and described.

136,033.—*Car-Coupling.*—GEORGE W. COFFIN, Pittsburg, Pa.

To withdraw the pin from the draw-head for the purpose of uncoupling the cars, the fork is inserted under the head of the pin and its handle pressed down, so that the fork, operating as a lever, shall raise the pin from its hole.

Claim.—1. The swinging crane attached to the end of a railroad car, carrying the tongs A and fork n, so that they may be operative in coupling or uncoupling the cars.

2. The tongs A suspended to the crane *c*, for guiding the link *m* in the operation of coupling.

3. The fork *n* suspended to the crane *c*, substantially as and for the purposes described.

136,034.—*Wick-Raiser for Lamps.*—ABEL COMBS, Philadelphia, Pa.

The wick is moved by spring-pickers attached to a ring having a guide-piece with a helical slot, in which works a stud attached to the outer cone. The motion of this cone is limited by a pin projecting through an opening in the rim. The pickers are made to grasp the wick by finger-pressers operated from the exterior.

Claim.—1. The inner cone *c*, when constructed with grooves or recesses for the reception of the spring-catches d^3, as specified.

2. The sliding clamp D, constructed, substantially as specified, of the ring *d*, spring-catches d^3, and guide d^2.

3. In combination with the spring-catches d^3, the pressers E, as described.

4. In combination with the sliding clamp D, having the groove d^2, the outer cone c^1, provided with the stud d^1.

5. In combination with the stud c^2 upon the cam c^1, the flanch c^4, cut away as shown, to limit the rotation of said cone, for the purpose described.

136,035.—*Churn-Dasher.*—WILBUR M. COMBS, Auburn, N. Y.

The wooden pinions take hold of their donkey-cranks by means of slots in their upper ends, an enlargement at the base of each slot giving spring to the parts, and another fitting around the crank; a pivoted band at the top binding the divided parts together.

Claim.—1. The dasher-staffs, slotted at their upper ends, with a bore at the lower extremity of the slot and another bore to embrace the crank-shaft, and secured to the crank-shaft by a pivoted clasp, *b*, as and for the purpose set forth.

2. The combination of the slotted dasher-staffs D D with dashers C C, the crank-shaft G, pivoted clasps *b b*, and removable boxes H H, all constructed as described, and arranged to be used with the churn A, substantially as and for the purposes herein set forth.

136,036.—*Preparing Blood for Fertilizers.*—WILLIAM D. CRAVEN, Jersey City, N. J.

Treating blood in a vessel by the direct application of heat without the direct contact therewith of steam or boiling in water.

Claim.—1. The process, substantially as herein described, for treating blood for a fertilising agent, or other purposes, by the injection or introducing it directly upon the heated walls of a vessel or chamber.

2. The within-described method of treating blood by the employment of force or pressure to inject it into a heated vessel or chamber or upon heated walls.

3. As a new article of manufacture, blood treated and prepared for fertilising or other purposes, substantially as set forth.

136,037.—*Manner of Punching Bolt-Holes in Steel Railroad Rails.*—THOMAS CRITCHLOW, Baldwin, Pa.

The hole is punched while the rail is hot.

Claim.—In combination with a railway-rail, straightening-table or saw-carriage, a punching-machine located thereon, and stop-gages connected with said machine to regulate the relative positions of machine and rail, jointly with the method of applying said machine to the punching of rails while the same lie upon the table or saw-carriage, and while still retaining the heat previously imparted to the metal to effect the rolling of the same to the form of a rail, all substantially as set forth.

136,038.—*Clothes-Washer.*—HEMAN D. CROOKER, Chester, Pa.

The device is constructed in form of an inverted funnel, with an open end for the handle, which projects downward and serves as a brace for the horizontal partition, which is secured to the inside and supported by cross-bars, which divide it into quarter-sections.

Claim.—The washer-head described, consisting of the conical wall having the imperforate horizontal partition B, braced above by the socket E connecting it with the top of the cone, and below by the vertical diametric cross-plates D attached to the inside wall of the cone, as specified.

136,039.—*Car-Coupling.*—GEORGE D. CROSTHWAIT, Murfreesborough, Tenn.

To one of the side bars of the draw-head is pivoted a bar, and to this is pivoted, in slots, jaws, so that when the weighted end of the bar is raised one jaw is also raised and the other is correspondingly depressed. The mouth of the draw-head is flaring, and the coupling is automatic.

Claim.—The lever D pivoted at *a*, provided with slotted jaw B and slotted lever *d*, having jaw C, in combination with buffer A, when all are constructed, arranged, and operated as shown and described.

136,040.—*Trunk-Hinge.*—ARMISTEAD M. DARRELL, Washington, D. C., assignor of one-half his right to THOMAS NORFLEET, same place.

A hinge, adapted to turn back at about a right angle upon a stop on one leaf, is provided with a rubber pad or cushion upon the other leaf, inserted directly beneath the pintle, thus, by the use of this elastic cushion, dispensing with the ordinary straps of the trunk-lid, the hinge so constructed sustaining the lid when open, and holding it in proper position.

Claim.—In a hinge for trunks or the like uses, the stop B' upon one leaf, in combination with the rubber cushion A' upon the other leaf inserted directly beneath the pintle, substantially as and for the purpose specified.

136,041.—*Steam-Boiler.*—WILLIAM H. DAVIS and RICHARD V. DE GUINON, Jersey City, N. J.; said DE GUINON assignor to said DAVIS.

The lower tube-chamber is a direct flue and the upper one a return flue. The boiler is an improvement on Dundonald's and Montgomery's.

Claim.—1. A marine or stationary steam-boiler, when made in two or more sections and constructed substantially as described, having two tube-chambers with vertical tubes, and a water-space between said chambers of sufficient size to admit a man to expand the tubes entering the said water-space.

2. Having the tubes in the upper tube-chamber so large that the tubes in the lower tube-chamber will pass through them to their place, as set forth.

3. The openings C C C in the tube-chamber for cleaning and examining the tubes, arranged as herein set forth, and for the purpose specified.

136,042.—*Stove-Pipe Damper.*—EPHRAIM K. DEAN, Bangor, Me.

The draft is checked by closing the flue and admitting cold air to the flue at the same time.

Claim.—1. The within-described damper *d*, in combination with and hinged to a funnel, A, having an aperture, *b*, therein, substantially as and for the purposes set forth.

2. In combination with the above elements, the notched rod *e* or its equivalent, as set forth.

136,043.—*Railroad Rail.*—ANDREW B. DEAN and THOMAS C. COLEMAN, Louisville, Ky.

The rails may be laid upon stringers for street railroads, or immediately upon the cross-ties, the latter being properly notched for the reception of the vertical flange or stem of each rail.

Claim.—The railroad rail, consisting of the body A forming the tread, the inner vertical tapering flange C, and the outer horizontal flange E, all constructed and arranged as specified.

136,044.—*Automatic Fan.*—WILLIS DE LANCEY HALL, Memphis, Tenn.

Claim.—The automatic fan, combining the bases P or Q with tube I, set-screw H, standard G, the train of cog-wheels A B, and balance-wheel C, slotted lever L, holder M, set-screw N, leaf W, fulcrum U, slot and set-screw V, all arranged and constructed substantially as described.

136,045.—*Bottle-Stopper.*—ADRIEN DE MESTRE, Bordeaux, France.

From the central ring radiates a series of twists, each dividing into two branches to form loops, the ends of the wire passing through the loops to form the neck-band, the ends of which, after passing through the loops, are twisted together and united by means of a metallic seal.

Claim.—A bottle-stopper or cap, composed of the central ring *a*, radiating twists *b*, branches *c c'*, loops *d*, and releasing neck-band *e*, constructed and arranged in the manner herein shown, and adapted to the neck of a bottle and stopper, as set forth.

136,046.—*Uterine Supporter.*—GERRIET DIRKSEN, Freeport, Ill.

The attaching-arms are furnished with two jaws spread slightly apart, which are expanded at their lower ends. Upon the inner face of one of these circular expanded portions are recesses arranged near the periphery. The stem of the pessary proper has also an expanded circular portion which fits between the ends of the arms described above, and is furnished with small projections. A set-screw secures the parts together, and effects any required adjustment by setting the projections within their corresponding recesses.

Claim.—The arms A A with jaws *a a* at their ends, one of the jaws having small recesses *i i* on its inner face, when used in combination with the stem C having a disk, *b*, at its lower end provided with small projections *c c* on one face, the parts secured together by the lateral adjusting-screw *d*, all substantially as set forth.

136,047.—*Cultivator.*—DAVID EDWARDS, Melbourne, Victoria.

The vertical supporting-spindle is pivoted to the axle-tree, so that the wheels may accommodate themselves to the inequalities of the ground without disturbance to the working of the implement. The draft-clevis is attached to the axle-tree and vertical spindle by means of links.

Claim.—1. The spindle H, passing down through the longitudinal slot E in the axle C and pivoted therein, and having its free end guided in the semicircular slotted bar F, as and for the purpose set forth.

2. The inclined links K K, flap N, and link L, in combination with the spindle H, slotted axle C, and semicircular slotted bar F, all constructed and arranged as herein shown.

136,048.—*Game-Board.*—GILBERT R. ELLIOTT, Boston, Mass., assignor to himself and FREDERICK MORRILL, same place.

A disk and an arrow revolve upon a pin at the center of the board. The disk has questions printed upon radial lines from its center, marked by certain characters at the outer edge. The answers are upon the board, concealed under the disk, and are similarly arranged and designated by corresponding characters. The arrow is whirled, and the question to which it points is answered by moving the disk around until its slot comes over the answer on the board corresponding to the question.

Claim.—The board A having center-pin *a*, arrow G, and the divisions or spaces B, each division containing characters arranged and distinguishable from the others, as shown, in the described combination with the disk D having the series of spaces E, slot *b*, and point *g*, the whole constructed and arranged as herein shown, and operating as and for the purpose specified.

136,049.—*Door-Lock.*—HENRY H. ELWELL, South Norwalk, Conn., assignor to THE NORWALK LOCK COMPANY, same place.

Is operated by either a principal key or a pass key. The bolt is provided with a principal and an auxiliary set of tumblers, each set consisting of one or more. The principal set is pivoted to the lock-case and constructed with a slip. The auxiliary set is pivoted to the bolt and provided with a stud. One key operates the principal tumblers to turn the slip into the path of the stud, the other key to raise the auxiliary set to bring the stud into line with the slip, each set being operated independently of the other.

Claim.—A lock-bolt, provided with a principal and auxiliary set of tumblers, each set consisting of one or more, the principal set pivoted to the lock-case, and the auxiliary set to the lock-bolt, the principal set constructed with a slip and the auxiliary set with a stud, *n*; one key operating the principal tumblers to turn the slip into the path of the stud, the other key to raise the auxiliary set to bring the stud into line with the slip, each set operated independently of the other, substantially as set forth.

136,050.—*Washing-Machine.*—WILLIAM H. FREED, Sioux City, Iowa, assignor of one-half his right to DAVID M. MCKNIGHT, same place.

From circular grooves or slots attached to the sides is suspended the rubber, with its ends working in the grooves, by which circular motion is given to the rubber in its connection with the rubber on its bottom.

Claim.—The circular grooves or slots N, traveling-block G, springs *f*, hinged lever H, combined with the rubbers C and D, constructed and arranged as specified.

136,051.—*Process for Making Cheese.*—HENRY O. FREEMAN, Sherburne, N. Y., assignor to HENRY D. GARDNER, North Marshfield, Mass.

The cream is all skimmed from the milk. The milk is heated to 96° or 100°, when melted fat is added. This emulsion is constantly stirred till the temperature is reduced to 84°, when rennet is added in the usual manner.

Claim.—The improvement in the art of manufacturing cheese by treating an emulsion of skim-milk and fat with rennet, substantially as before set forth.

136,052.—*Endless Rolling-Gear for Railroads.*—JESSE FEYE, Brooklyn, N. Y.

Wheels having two bearings, the smaller bearing of which revolves on the endless track, while the larger bearings carry the endless platform, the sections of which are connected by universal or knuckle-joints. The endless platform is propelled by means of a driving-wheel, in connection with any reversible stationary engine, located below the road-bed.

Claim.—1. The double bearing-wheels 1 2 3 4 5 and 1' 2' 3' 4' 5', secured to steel axle-trees revolving in the transverse hollow arms *a a'*, which form a part of the several sections of the coupling-bars R R', in combination with similar transverse arms arranged and forming a part of the longitudinal connecting-bar throughout the entire line of the road.

2. The endless sectional coupling-bars R R', united by universal or knuckle joints, in combination with the driving-wheels N N', cog-gearing wheels G G', operated by any reversible stationary engine suitably located below the road-bed.

136,053.—*Wheel for Endless Railways.*—JESSE FEYE, Brooklyn, N. Y.

Wheels having two bearings which are either elastic or rigid. The hub is divided in the center and provided with adjustable flanged plates to receive the adjustable hub, which is secured by means of bolts.

Claim.—1. The wheels W, with two bearings, 1 1' and 2 2', either flexible or rigid, in combination with the sleeve or hub-chambers N N, with the dividing-partitions S S and adjustable flanged plates K K, to receive the adjustable hubs H H, all secured by means of the bolts O O, or otherwise, for railroads, turn-tables, draw-bridges, or analogous uses.

2. In combination with the wheel W, the elastic packing C and flexible or rigid bearing 1', all arranged and operating substantially as described.

3. The diverging ribs *r r*, to support the face-plates of the double-bearing wheels W W, all arranged and combined substantially in the manner and for the ostensible purpose set forth.

136,054.—*Platform-Carrier for Endless Railways.*—JESSE FEYE, Brooklyn, N. Y.

An endless platform, constructed in sections, is connected by universal joints, and has upon its lower side flanges to keep it upon the carrying-wheels. These wheels, to which motion is imparted by a stationary engine, are made double, the smaller periphery revolving on the rail, while the platform rests upon the larger wheels and is revolved thereby.

Claim.—1. The platforms E E', united by universal or knuckle joints to form an endless-platform carrier, operating upon the outer bearing or larger periphery of the wheels W W' by means of the transverse arms *a a'*, which pass through and form a part of the longitudinal guide-bar R, for the purpose, and in the manner as above set forth.

2. Angle or equivalent rails upon the under side of each section of the endless platform E E' to keep the same upon the top of the wheels W W', substantially as above described, and shown in the drawing.

136,055.—*Armor-Clad Vessel.*—LOUIS GODDU, Boston, Mass.

Claim.—In an armored vessel, constructed substantially as described, the revolving turret, constituting the apex of a cone, of which the frustum forms the highest part of the deck, and extends down to the guards of the vessel, so that the vessel may be partially submerged and thereby leave only the conical turret and a small part of the frustum, on which it is seated, exposed to the enemy's shot.

136,056.—*Ironing-Table.*—JOHN R. GROVES, Hightstown, assignor to ELIHU H. ROPES, Elizabeth, N. J.

A base and stand having a dovetailed groove in the top of the stand to receive a block, to which is attached the ironing-board.

Claim.—The stand A, having the tapering dovetailed recess C and button *d*, in combination with the ironing-board E, having the tapering dovetailed block D, notched at *d'*, substantially as specified.

136,057.—*Sewing-Machine.*—CHRISTOPH GULLMANN, Paterson, N. J.

A pin on a rod, connected with the rear of the needle-bar, enters a slot in the strap operated by the eccentric, and sliding on or guided at its outer end by a stationary pin. The adjacent slotted strap slides over the same pin, and is connected with the end of the shuttle-carrying lever.

Claim.—1. The combination of the slotted lever-strap *g*, operated by the eccentric *e* and sliding on pin *i*, with the rod F, connected with the needle-bar E, and with the strap, substantially as and for the purpose described.

2. The horizontal shuttle-driving lever H, operated substantially as described, so that the shuttle travels in an elliptical orbit, passing through the loop close up to the under side of the cloth-plate, and returning in a plane below that occupied by the point of the needle, thus holding the needle-thread taut, substantially as set forth.

3. The shuttle-carrier hinged to a shuttle-lever, H, which moves on a universal joint, said shuttle-carrier being subjected to the action of a spring, *l*, which enables the shuttle contained in the carrier to accommodate itself to the shuttle-race during the evolutions of the shuttle-lever, substantially as described.

136,058.—*Slate-Cleaner.*—FRANCIS HICKMAN, Reading, Pa.

An elastic water-holder with a small orifice in one end, and closed at its other end by a plug, to which is attached a wiper of sponge or other fibrous or cellular material.

Claim.—1. An elastic water-holder, *a*, constructed and operating as herein described, in combination with a dry-wiper, *c*, applied to the closed end thereof, for the purpose specified.

2. The improved slate-cleaner, composed of the water holder and ejector *a*, wiper *c*, and interposed stock *b*, constructed and combined, substantially as described, for the purpose set forth.

136,059.—*Sling for Raising Animals.*—FRIEDRICH HONORST, New York, N. Y.

Claim.—The combination, in a sling, A, of the side ropes *b b'*, extension *c*, and grommets or eyes *a a*, with or without the safety-strap *f*, substantially as and for the purpose herein specified.

136,060.—*Spittoon.*—JAMES L. HOWARD, Hartford, Conn.

Two parts fitted to form a close joint by a projection near its bottom, with a floating valve fitted to an aperture in its bottom, which, by the aid or weight of the wire suspended from it, is held upright to float when necessary for the discharge of its contents, and is supported by a coupling with a flange, by which it may be attached to the floor of a car.

Claim.—1. The two-part double-wall spittoon having a close joint formed at the short bearing *y*, forming and uniting the two parts in the manner substantially as described.

2. The self-acting floating valve D, applied to the tubular outlet *z* through the base of the spittoon, substantially as described.

3. The combination of the flanged screw-collar C, the tubular opening *z*, the valve D, and the spittoon-base B, substantially as described.

136,061.—*Blind-Hinge.*—ABRAHAM HUFFER, Rochester, N. Y., assignor to MAURICE H. MERRIMAN, same place.

A surface-hinge is provided with a bearing-plate, which extends from it at right angles. Upon this bearing-plate is secured a flat spring, which acts upon the cam-surfaces arranged around the pintle-socket, and this holds securely the blind in position. By securing the flat spring at right angles to the leaf, instead of in the same plane therewith, mortising is rendered unnecessary, and the hinge may be used upon brick walls.

Claim.—In a surface-hinge, the combination of the stationary part A with the bearing-plate C at right angles to it, in which is secured the flat spring D, substantially as and for the purpose set forth.

136,062.—*Gang-Plow.*—ALBERT N. HUMPHREY, Brodhead, Wis.

The plow-frame is pivoted to the outer frame by means of a transverse rod sliding in segmental slotted plates attached to said outer frame, the said rod being adjustable by means of the levers E. The draft-evener is attached to a cross-bar on the outer frame and to the axle.

Claim.—1. The combination and arrangement of the pivoted inner frame C carrying the plows L and transverse rod B^2, the outer draft-frame B having the slotted segmental plates B^1 and levers E, substantially as specified.

2. The plate S secured to the axle A, and plate S' secured to the frame B, in combination with the evener Q, double-tree O, and single-trees I^2 P R, substantially as described.

136,063.—*Lamp-Stove.*—FRANZ JANKE, Brünn, Austro-Hungarian Monarchy.

Claim.—1. The heating and cooking apparatus of a petroleum-lamp having a chimney, C, of a certain specified height, extending into the heating-chamber F, with a space between the bottom of the latter equal to the diameter of the chimney-top *c*, and also equal to the area of the openings I J K, by which arrangement and relation of these parts the gases and smoke from the lamp are consumed, as described.

2. The wire netting or basket N, located and arranged within the central chamber F and above the lamp-chimney, in the manner and for the purpose herein shown and specified.

3. The heating apparatus A B, provided with socket stems *a* for adjustment upon the branches *b*, braced by the frame M, as and for the purpose described.

136,064.—*Propelling Canal-Boats.*—ASA JOHNSON, Brooklyn, N. Y., assignor of one-half his right to WM. H. JOHNSON, New York city.

Shafts, ratchet-wheels, pawls, sliding catches, springs, and gear-wheels peculiarly adapted to rotate a paddle-shaft to propel a boat, which boat is provided with two or more tapering supporters made of metal and provided with flanges by which they are secured to the bottom of the boat by bolts.

Claim.—1. The combination of the shafts D D, ratchet-wheels E, pawls E^2, sliding catches E^3, springs E^4, and gear-wheels F F, substantially as and for the purposes herein set forth.

2. In combination with the arms C C', pawls E^2, sliding catches E^3, and springs E^4, the connections H^3, shafts H^2, wheels H^4, handle H^1, chains H^1 H^3, and spring H^4, all substantially as and for the purposes herein set forth.

3. The combination, with a canal-boat of usual form, of two or more metal floats or air-chambers, constructed substantially as shown, and provided with flanges, whereby said floats may be readily bolted to the bottom of the boat, for the purposes set forth.

136,065.—*Ripper and Rag-Looper.*—HARLEY M. JOHNSON, Marshall, Mich.

For a rag-looper, unscrew the ripper and fasten into a bench or table.

Claim.—The blade *b*, having the cutting-edges *d o*, projection *i*, and screw *e*, substantially as set forth.

136,066.—*Apparatus for Condensing and Purifying the Smoke of Metallurgic Furnaces.*—WILLIAM J. JOHNSON, Allendale, England.

The smoke is purified by passing through the spray and the water dripping from the partitions.

Claim.—1. The combination, with a flue for the passage of the products of combustion, of a series of slats or a screen, or its equivalent, from which water is caused to fall in a constant shower, substantially as described.

2. The combination, with the slats or screen, of a wheel, by which water is thrown upon the slats, as specified.

136,067.—*Railroad Bed.*—JOHN WILLIAM KERR, Portland, Oreg.

An angular metallic sheeting with platforms and flanges for uniting and supporting rails, secured by cleats and rods.

Claim.—1. The improved railroad bed having the angular ridge B located between the rails A, substantially as specified.

2. A railroad bed composed of sheets of metal joined together, raised in the middle to form the ridge B, and extended at the sides to produce rail-supporting platforms C, all substantially as and for the purpose described.

3. The sheets B, constituting the prismoid railroad bed, and joined together by overlapping and angularly corrugating the edges, substantially as specified.

4. The flanges *d* and cleats H, in combination with a metallic railroad bed having the prismoid metallic ridge B and the rails A, substantially as specified.

5. The iron ties J, in combination with the metallic angular bed B and platforms C, substantially as specified.

136,068.—*Car-Wheel.*—JOHN W. KERR, Portland, Oreg.

Hollow conical car-wheels, having the common bearing-surface, and also the surface from the flange to the inner end of the wheel is adapted to run on beveled tracks. A hardened metallic collar is placed between the inner surfaces of the wheels. One of the wheels is rigidly and the other is loosely attached to the axle to lessen the friction in turning curves.

Claim.—In a car-truck, the fixed wheel C and the loose wheel C, said wheels having conical bearing-surfaces facing each other, and rail-treads extending outward therefrom, substantially as specified.

136,069.—*Ink-Well.*—JAMES H. KIDDER, Lawrence, Mass., assignor to himself and GILBERT E. HOOD, same place.

The mercury displaced by the depression of the annular flange attached to ink-spout, through the medium of air, forces the ink upward into said spout.

Claim.—An ink-well provided with a chamber, I, for receiving a quantity of mercury or its equivalent liquid, in combination with an ink-spout and an ink-regulating mechanism, substantially as described, for the purpose specified.

136,070.—*Inkstand.*—JAMES H. KIDDER and GILBERT E. HOOD, Lawrence, Mass.

The ink-well has an obtuse-angled bottom and, swinging in its frame, is supported thereon when tilted forward to expose the ink or backward when not in use, a flap-valve closing the dipping-orifice.

Claim.—An ink-well having its base or bottom H made with the two inclined faces I J, and otherwise constructed substantially as described, for the purpose set forth.

136,071.—*Fastening for Halter-Rings, &c.*—ERASTUS M. KINNE, Cuba, N. Y.

The ring, being an improvement on applicant's former patent, is bent up to allow the strap to draw in a straight direction.

Claim.—1. The trimming for halters, bridles, &c., consisting of the plates A A, cast together at an angle and strengthened by the cross-band H, each plate being formed with an inclined recess, a rivet-hole, *l*, an ornamental convex cross-bar, C, and a transverse slot, B, having a rounded edge, *d*, substantially as described, for the purpose specified.

2. A harness-ring, runner, snap-hook, buckle, &c., cast with one or more plates, A, having a central rivet-hole, *l*, the inclined recess, the convex cross-bar C, and the transverse slot B, having the rounded edge *d*, as herein set forth.

136,072.—*Fruit-Gatherer.*—JOHN KISOR, Nevada, O.

A hopper or funnel-shaped frame, covered with canvas, is mounted upon a pair of wheels, the bolster upon which it immediately rests being adjustable in order to bring the receiver level on uneven ground. A discharge-spout is formed at the bottom, and provided with a flexible valve to prevent the fruit from being bruised when it rolls into the spout.

Claim.—1. The combination, with the apron A a^1 of a fruit-gatherer, of the valve a^2, substantially as specified.

2. The adjustable pivoted bolster D, in combination with the axle E and a frame for supporting the apron A, substantially as shown and described.

3. The combination of the adjustable pivoted bolster D, axle E, frame B B^1 B^2, apron A, and platform G, substantially as specified.

136,073.—*Harness-Mounting.*—JACOB F. KNORR, of New York, N. Y.

The ring and shank are made of one piece of half-round wire bent to shape.

Claim.—1. A terret, pad-hook, or other article of a similar nature, made of a semi-cylindrical bar of iron, bent to form a ring, *a*, and a stem, *b*, substantially as shown and described.

2. A terret, pad-hook, or other article of a similar nature, made of a grooved bar of iron, bent to form a ring, *a*, and a stem, *b*, and provided with a filling-piece, *f*, of any desirable material, substantially as specified.

3. The combination of a base, B, having concave flanges *d* with a terret, pad-hook, or other article of a similar nature, made of a semi-cylindrical or grooved bar of iron, substantially as set forth.

136,074.—*Nail Selecting and Delivering Machine.*—ALBION KNOWLTON, Boston, Mass., assignor to JAMES W. BROOKS, trustee, same place.

Two reciprocating slotted slides form the bottom of the hopper, so that when either of the slots are brought under the hopper a nail will fall through said slot. The nails are fed into the hopper some with their heads in one direction and others in the opposite direction. A sliding finger in the hopper automatically determines, by the position of the nail, which slot to draw under the hopper in order to let all the nails fall through head foremost, no matter how they lie in the hopper, or point foremost, as desired.

Claim.—1. The combination, with a hopper or chute, of the finger and the two slides, operating substantially as and for the purpose set forth.

2. The combination and arrangement of the nail-receiving socket and the two slides, operating to drop each nail in accordance with the position of its head, substantially as shown and described.

136,075.—*Horse-Power.*—ZACHARIAH P. LANDRUM, Columbus, Miss.

Claim.—One or more levers, D, wheel C having hanger F and fulcrum-frame E G G I, combined with shaft B, as and for the purpose described.

136,076.—*Molasses-Pitcher Top.*—GEORGE PHILLIP LANG, Jr., Allegheny, Pa., assignor to LANG & LAUSTER, same place.

A pitcher-top, constructed with its mouth or upper opening partially covered with a rigidly-attached cap, with a discharge-opening, over which is closely fitted a hinged cover, formed to fit the uneven surfaces of the inner one, for the exclusion of insects, &c.

136,077.—*Case for Heating Sad-Irons.*—GEORGE W. C. LOVELL, Clarksville, Tenn.

The case consists of two shells, which, when folded together, are designed to inclose the base or heater of an iron.

Claim.—The heating-case for sad-irons, constructed and adapted for use substantially as herein set forth.

136,078.—*Thill-Coupling.*—JOSHUA LOW, Steubenville, O.

One lug of the clip has a beveled slot. Upon the connecting-bolt is a beveled rib which enters the slot in the lug. When the thills are raised from a horizontal position the bolt is forced into the slot by means of a spring which is secured to the side of the lug, and presses upon the end of the bolt.

Claim.—The clip A having in one of its jaws the slot *a* with incline *a'*, and the thill-iron B with slot *b*, in combination with the bolt C, having rib D, having incline *d* and the spring *h*, all constructed and arranged to operate substantially as and for the purposes hereinin set forth.

136,079.—*India-Rubber Spring.*—ALLEN MAGOWAN, Trenton, N. J.

A core of India rubber of any desired length and diameter, cylindrical, and having preferably a central hole or bore. Around and concentric with this core, and in contact with its outer circumferential surface, are rings of India rubber. These rings are placed one upon another, and the whole is placed snugly in a suitable case to be acted upon by a plunger in the ordinary manner.

Claim.—The combination of the central cylindrical India-rubber core A and the concentric system of India-rubber rings B, circular in their cross or radial section, substantially as and for the purpose specified.

136,080.—*Machine for Trimming, &c., the Edges of Boot and Shoe Soles.*—JAMES W. MALOY, Boston, assignor to BENJAMIN F. LARRABEE and SAMUEL H. HODGES, Lynn, Mass.

Attached to the end of a shaft is a revolving plate, upon which the boot or shoe support is made to slide by means of a cam or disk, susceptible of horizontal adjustment. The platform upon which the shaft is supported, has both longitudinal and lateral motion, so as to carry the boot or shoe to or from a stationary cutter, and to describe any desired curve required in the trimming operation.

Claim.—1. A chuck bearing the last for the boot or shoe, in combination with an eccentric which causes the chuck to slide, reciprocating platforms which carry the chuck both laterally and longitudinally, and a shaft which causes said chuck to revolve and said platforms to reciprocate, all substantially as described.

2. In a machine for trimming and burnishing, &c., the edges of the soles of boots or shoes, the bed or platform *e*, supporting a shaft, *g*, and operated by cam B, stem and roller *g''*, beam *q*, arms *r s*, stem *x*, levers *y v*, all arranged as described, or equivalently, so as to travel and carry the chuck or jack *k* back and forth laterally, substantially as specified.

136,081.—*Apparatus for the Manufacture of Gases.*—WILLIAM MAYNARD, Salem, Mass.

Claim.—The condenser or generator C, provided with a water-supply pipe and a water-percolating medium, as herein specified, and arranged above and in communication with the air-tight chamber F, in combination with each other and with the vapor-pipe D, vaporized-water pipe L, oven B, and furnace A, with or without the pipe N and elevated condenser M, all arranged and operating substantially as described, for the object specified.

136,082.—*Process for Treating Hides and Skins.*—WILLIAM MAYNARD, Salem, Mass.

Sulphurous-acid gas and carbonic acid or carbureted hydrogen are incorporated with well-known ingredients in the process of tanning.

Claim.—1. The process of softening, plumping, and bleaching hides, or pieces of the same, skins, &c., by the means of sulphurous-acid gas, substantially as described.

2. The process of liming hides or skins, &c., in the manner and by the means of the materials, substantially as described.

3. The process of drenching or purifying limed hides, skins, &c., substantially as described.

4. The process of tanning hides by using, in combination with the tannin extract, sulphurous-acid gas, substantially as described.

136,083.—*Fettling for Puddling and Boiling Furnaces.*—JAMES C. MCANINCH and GEORGE ATKINS, Youngstown, Ohio.

Pulverized sand-stone with sufficient water or other liquid to form a mortar.

Claim.—An improved preparation formed by mixing pulverized sand-stone with sufficient water or other liquid or liquids to reduce it to the consistency of mortar, to be applied to the inside bridge, back, and jamb-chills of furnaces in the manufacture of iron and steel, substantially as herein described, and for the purpose set forth.

136,084.—*Gas-Lighter.*—EDWIN D. MCCRACKEN, New York, N. Y., assignor to LUCIUS A. BIGELOW, trustee, Boston, Mass.

Claim.—1. The arrangement within and in connection with the valve-box A of the fixed partitions R *a*, diaphragm D, valve S, spring K, and pipes E, G, M, H, and *e*, substantially as herein described, whereby the entire operation of letting on, lighting, and shutting off the gas is effected by the action of a single valve within the box.

2. The groove *x*, in the illuminating-burner, in combination with the igniting-burner, substantially as and for the purpose herein set forth.

136,085.—*Can for Paint, Liquids, &c.*—HERMANN MILLER, New York, N. Y.

Claim.—The lid B, constructed to fit as a conical valve over the mouth portion *c* of the can, in combination with the groove *e* in the cover, substantially as shown and described.

136,086.—*Rocking-Chair.*—WILLIAM MOHR, New York, N. Y.

A foot-rest attached to the rockers by slots, the arms of which have the same curve as the rockers.

Claim.—A rocking-chair, in combination with the extension C C, foot-board C', set-screw *a*, washer *b*, and metallic or wooden piece *e*, substantially as and for the purposes herein described and set forth.

136,087.—*Sole-Edge-Setting Tool.*—JONATHAN H. MORRISON, Marlborough, Mass.

Claim.—The sole-edge tool composed of a stock or bar, A, the sole-edge shaper or setter C, and the two handles D D', arranged as represented, the shank having the offset, all substantially as described.

136,088.—*Mechanical Power.*—EDWARD W. MORTON, Brooklyn, E. D., N. Y.

Hinged racks working cog-wheels alternately by means of a float, which rises and falls with the tide or artificial flow and subsidence of water.

Claim.—1. The combination of a float, A, tank B, racks E E', pinions *e e'*, cog-wheels *e e'*, and working-shaft *h*, substantially as and for the purpose herein shown and described.

2. The hinge-joints *i i'* at the bottom ends of the racks E E', in combination with a suitable fastening device at the upper ends of said racks when the racks are connected with a float, A, tank B, pinions *e e'*, cog-wheels *e e'*, and working-shaft *h*, substantially in the manner and for the purpose herein set forth.

136,089.—*Pipe-Wrench.*—ERI S. MOULTON, Chelsea, Mass.

Claim.—The jaw B pivoted to the block G, and each arranged and moving together in the slot E of the stationary jaw and adjusted by the screw L, substantially as set forth.

136,090.—*Raising Piano-Forte Lids.*—HERVEY N. OLIVER, Rahway, N. J.

Compensating springs take most of the weight of the lid, which is then readily controlled by a lifting-pedal.

Claim.—1. The combination, with the hinged lid of a piano or other case, of one or more balancing-springs, applied to operate substantially as specified.

2. The combination, with a spring-balance applied to the lid B, of a treadle, E, and lifter *g*, essentially as and for the purpose or purposes herein set forth.

3. The adjustable prop G, in combination with the treadle E, lifter *g*, and lid B, substantially as specified.

136,091.—*Type-Casting Machine.*—JOHN A. T. OVERKIND, San Francisco, Cal.

Devices for injecting the melted metal into the mold, for pressing the mold and type-carrier against the ejection-nozzle, and for breaking the type from its stem and at the same time pushing it through between the rubbers.

Claim.—1. In combination with the pump-cylinder D having the openings *b* and *d*, the chambered piston E having slot or opening *d'*, the whole constructed to throw the metal into the mold without the use of valves, and operating substantially as herein described.

2. The sliding plate N, arranged as described, so as to carry the type between the rubbers P P, in combination with the carrier I, clamp L, and table K, constructed and operated substantially as and for the purpose set forth.

3. The cam J and the arm D, constructed and operated substantially as described, for the purpose of giving the carrier I, the mold *g*, and the matrix *f*, a side movement and making a tight joint.

136,092.—*Game-Table.*—LUTHER A. POWERS, West Meriden, Conn.

Near the foot of the table vertical rods, approaching somewhat nearer than the diameter of the balls, are arranged, and connect with hammers, which sound bells when the balls pass under said rods.

Claim.—The combination of the table A, pins *a*, rods C, hammers E, and bell F, constructed and arranged relative to each other, substantially as set forth.

136,093.—*Spike-Extractor.*—GUSTAVUS A. PERKCOTT and JOSEPH RAMSALOUX, Sandy Hill, N. Y.

A rubber block is placed between the jaws, the distance between which is varied by means of a screw-bolt passing through them and the block, so as to enable the implement to grasp spike-heads of different sizes.

Claim.—1. The jaws A A, made separate and pinned loosely on the end of the lever B, in combination with the rubber spring C and bolt *b*, substantially as and for the purposes herein set forth.

2. The combination of the jaws A A, lever B, rubber spring C, wedge D, and swinging foot or standard E, all constructed and arranged to operate substantially as and for the purposes herein set forth.

136,094.—*Wire-Fence.*—JOSHUA W. RAPPLEYE, Farmer Village, N. Y.

Pickets being plaited into horizontal wires, the wires have bearings upon the fronts of posts. A wire secured to the first picket on each side of the post passes behind the post, embracing it lightly.

Claim.—In combination with the main twisted wires B and the pickets C C, the brace-wires H attached to the end pickets of each panel so as to pass to the rear of the posts A opposite the attachments or bearing of the main wires, in the manner, and for the purpose specified.

136,095.—*Bottle-Stopper.*—HERMANN F. REINER, Blairsville, assignor to himself and FRANK LOFINK, Pittsburg, Pa.

The stopper is composed of a metallic tapering tube, which is provided with a horizontal central flange, which, when the stopper is applied to the bottle, rests upon its upper end. It is also provided with a bayonet-slot for receiving and securing the vertical stem of a conical disk-valve, by the movement of which stem the valve is opened or closed to admit of the induction and discharge of liquids.

Claim.—The bottle-stopper herein described, consisting of the tube B provided with slots K M, valve F, and bent valve-stem I, as herein shown and described.

136,096.—*Sole-Edge-Trimming Tool.*—ICHABOD R. ROGERS, Lynn, Mass., assignor to himself, JOHN WOOLDRIDGE, and GEORGE E. BARTLETT, same place.

A hand-tool, with its cutter so arranged that the sole will be left with its finished edge lessened in thickness.

Claim.—The sole-edge-trimming tool, having the cutter and its cutting-edges arranged with respect to the gage-faces, substantially as shown and described.

136,097.—*Bed or Cradle Guard.*—JOHN JAMES ROLL, Newark, N. J.

The guard is made of textile or woven material, and is connected to the posts at one end by hooks and rings, and at the other end by buckles and straps.

Claim.—As an article of manufacture, the net-guard C, in combination with the hooks and rings *d d* and buckles and straps *e e*, substantially as and for the purposes specified.

136,098.—*Embroidering-Attachment for Sewing-Machines.*—ISRAEL M. ROSE, Brookhaven, N. Y.

The latch-needle on a rock-shaft carried in the vibrating plate, secured to the presser and actuated from the needle-carrier, takes a thread from the guide, draws it under the needle-thread, and forms it into a chain on the upper side of the fabric.

Claim.—1. The vibrating plate C carrying the latch-needle E for the purpose of laying an embroidering thread upon the surface of the fabric, as set forth.

2. The latch-needle E fastened to the rock-shaft D, which has an independent axial play on the vibrating plate C, as and for the purpose specified.

3. The guide h arranged in conjunction with the movable latch-needle E on the presser-foot of the sewing-machine, as set forth.

4. The embroidery-thread carrier E of a sewing-machine attachment, when arranged so as to perform a longitudinal and also a slight lateral motion to carry the embroidery-thread toward and by the sewing-needle, as specified.

5. The combination of the sewing-machine needle with the vibrating embroidery-thread carrier E, as set forth.

6. The mechanism herein described for applying an embroidery-thread upon the surface of the fabric and stitching the same down by the sewing-thread, as set forth.

136,099.—*Folding Rocking-Chair.*—ABEL RUSSELL, Brooklyn, N. Y., assignor to ABEL RUSSELL, Wilton, Me., and C. M. ALEXANDER, Washington, D. C.

The frame is creased and pivoted, and the limbs extending in the rear are pivoted to the rear end of rockers. The front ends of the rockers have several holes on their upper surfaces, and the limbs extending to the front are inserted in those holes for adjustability.

Claim.—The combination of rockers A, limbs B and C, when the rockers A are so arranged with slots *c c c* and pivots *a a* that limbs C may be adjusted to different positions, thus forming a convenient invalid rocking-chair or rocking-couch.

136,100.—*Riveting-Machine.*—WILLIAM SELLERS, Philadelphia, Pa.

An improvement upon the invention patented to applicant February 7, 1871. To prevent steam from following the piston-rod the rear end of the horizontal semi-cylindrical trough next to the cylinder is made cylindrical, and the rear end of the piston-rod is made to correspond and is provided with steam-tight packing.

Claim.—1. The combination of the cylinder N with the cylinder D and trough or guide E.

2. The combination of the piston O and cylinder N with the piston F and cylinder D.

3. The combination of the packed piston F with the packed piston-rod G and trough E.

136,101.—*Machine for Forming Cutters for Cutting the Teeth of Wheels.*—WILLIAM SELLERS, Philadelphia, Pa.

Claim.—1. As an improvement in the art of forming teeth for wheel-work, or of forming cutters which are the counterpart of the spaces between the teeth to be cut, describing the outline or contour of the tooth to be cut, and imparting to the cutting-tool a movement conformable to such outline or contour by adjustable automatic mechanism, substantially such as hereinbefore set forth, and without requiring the use of templets or patterns.

2. As an improvement in the aforesaid art, describing the outline or contour by adjustable automatic mechanism, substantially such as herein set forth, and imparting to the cutting-tool a movement describing the same outline or contour in symmetrically-reduced proportions, substantially as set forth.

3. The combination, with the adjustable radius-bars G and I, of their respective stops *m* and *y*, for the purposes described.

4. The combination, with the adjustable radius-bars G and I, of the adjustable piece H, for the purposes set forth.

5. The combination, with the saddle C or its equivalent, of the graduated extension K or its equivalent, for the purposes described.

6. The combination of the radius-bar E and the adjustable sliding saddles B and C, for the purposes described.

7. The combination, with the adjustable radius-bars E and G, of the center-pin F, for the purposes described.

8. The combination of the extension-piece K, the radius-bars I and G, the stops *m* and *y*, and the adjustable piece H, for the purposes set forth.

136,102.—*Treating Ores of Silver.*—JASPER HENRY SELWYN, Gloucester Crescent, Hyde Park, England.

The ore is roasted and then boiled in a solution containing salt, hydrochloric acid, and black oxide of manganese.

Claim.—The treating of refractory ores of silver by boiling the same in a solution of common salt and hydrochloric acid in presence of free chlorine gas, as described.

136,103.—*Measuring-Can for Oil, &c.*—WARDELL B. SHERMAN, Clinton, N. Y.

Two transparent measuring-scales are provided, one for indicating the quantity of oil or other liquid in the large receiving can or reservoir, and the other for showing the quantity to be drawn into a small attached chamber for retail supply.

Claim.—The combination of the device composed of the transparent tube *c*, with its communicating elbows *f* and *g*, for indicating the quantity of liquid in the receiving-vessel, with the measuring device *d d*², and the cock D for indicating the quantity desired to be drawn, substantially as described and set forth.

136,104.—*Portable Lamp Cooking Apparatus.*—ALBERT MARCUS SILBER and FREDERICK WHITE, London, England.

Upon an Argand lamp-burner is a boiler, centrally through which is a passage answering to a chimney. Upon its upper edge is adjusted a support to hold a second vessel immediately over the flue or chimney.

Claim.—The improved lamp for lighting or cooking, consisting of the wick-tube D, central air tube or tubes G, and outer jacket C, by which air is supplied to both sides of the flame through openings *h* in the base of the lamp, and the vessel L with its central flue *i* and cover *o o* supported by the burner, all constructed and arranged so that a cooking-utensil may be applied to the top thereof, substantially as described.

136,105.—*Ventilating Water-Closets and Urinals.*—ROBERT D. O'SMITH, Washington, D. C.

One end of an outlet-pipe is connected to the bowl of a water-closet, the other end communicating with a chimney-flue, which causes a constant flow of air downward through the bowl and conveys the foul air above the roof. Also, an air outlet-valve is connected to the side of the bowl in such a manner that by the action of the seat the valve may be opened or closed.

Claim.—1. A bowl A, provided with an enlargement or chamber, *d*, and an outlet, D, substantially as shown, and for the purpose set forth.

2. In combination with the bowl A and outlet D the opening V, with or without a valve, substantially for the purpose set forth.

136,106.—*Stalk-Chopper.*—CHARLES L. SPIELMAN, Blandinsville, Ill.

A set of tappets are fixed upon the axle-tree, and so adjusted that their releasing points are at equal distances. A set of spring-arms, which carry vertically-moving knives, are operated by these tappets, producing a rapid vibration in the cutters.

Claim.—1. The combination of the wheel-shafts *b* provided with tappets *b'*, and the adjustable spring-arms I carrying the vertical cutters G, substantially as and for the purpose specified.

2. The combination of the crank-lever P and lever R with shaft L, adjustable blocks J, crank M, connecting-rod *m*, and lever N, substantially as and for the purpose specified.

136,107.—*Seeding-Machine.*—JOHN W. STROWBRIDGE, Cortland, N. Y.

The pulley or belt attachment revolves a shaft and wheel, which, in turn, drives the upright shaft and the distributer. The plaster or other substance is turned into the hopper slides, the slide drawn, and the plaster drops upon the distributer, is received by the fans, and spread broadcast.

Claim.—A broadcast seed-distributer, consisting of the shaft *b* provided with the pulley Z and wheel *c*, the upright shaft E provided with the pinion E, radial grooved arms *g*, and agitator I, and the hopper N, all constructed and arranged substantially as described, whereby it can be attached to and detached from the rear end of a wagon or cart, as set forth.

136,108.—*Cultivator.*—JOHN W. SWICKARD, Galva, Ill., assignor of one-half his right to JOHN HOUGH, same place.

The plow-beams are pivoted to auxiliary beams, which are pivoted at their forward ends to the axle. By this means the plows always move forward in the same line of progression, while they may be moved freely to either side by the handles pivoted on the hinge-plates and connected to the plows by yokes.

Claim.—1. The combination of plates K, bars h h, and beams E E with the pivoted handles N, substantially as and for the purpose specified.

2. The handles N N and yokes M M, when combined and arranged to operate with the journals *b b*, plates K K, bars h h, and beams E, substantially as described, and for the purpose specified.

3. The guards P P, when combined and arranged to operate with the vertical parts *a' a'* of the axle A, substantially as described, and for the purpose specified.

136,109.—*Eaves-Trough Hanger.*—HENRY B. TODD, Plymouth, Conn.

Claim.—The cross-piece A having projections H at each end and ridges G and slot F, and provided with a clamp-screw, C, in combination with the notched band-iron D, forming an adjustable attachment for supporting eaves-troughs.

136,110.—*Saw-Gummer.*—WILLIAM TUCKER, Fiskedale, Mass.

The punch used has the cutting end larger than the shank, and is held in a guide or sleeve, and driven through the saw, falling out with the material gummed through an inclined passage in the die and stand. The sleeve is removed every time, to replace the punch, from the socket, the front end of which is divided, and has projecting ears that are drawn together by a screw-bolt and nut to firmly clasp the sleeve.

Claim.—1. The punch *p* constructed with a contracted shank, *e*³, in combination with a corresponding guide, *s*, and die *d*, and a passage, *e*³ *f*, for the discharge of punch and punchings, substantially as herein shown and described, to operate in the manner and for the purpose specified.

2. The perforated arm *g* with opening *i* and ears *k k*, in combination with the clamping-screw *n* for supporting the guide *s*, and the punch *p* therein, as set forth.

136,111.—*Boot and Shoe Fastening.*—GEORGE H. WARD, Middletown, Conn.

The buttons are secured to a sheet of elastic cloth between the upper and lining, and slits are made in the upper to allow the eyes of the buttons to move forward and bring the elastic into operation.

Claim.—The elastic material B inside the upper combined with its slits *a* through the upper, through which the buttons extend and are attached to the said elastic material, substantially as set forth.

136,112.—*Tool for Milling Carriage-Shaft Eyes.*—WILLIAM S. WARD, Plantsville, Conn., assignor to H. D. SMITH & Co., same place.

The purpose of the mill A is to bore the hole in the shaft eye, or the hole through the shackle, which is attached to the shaft or pole. The mill C cuts the ends of the eye down to the length desired by setting the gage accordingly.

Claim.—The herein-described milling-tool, consisting of the principal mill A, guide D, and the cylindrical mill C, combined and made adjustable relatively to each other in the manner described.

136,113.—*Lamp-Burner.*—WILLIAM N. WEEDEN, Waterbury, Conn., assignor to BENEDICT AND BURNHAM MANUFACTURING COMPANY, same place.

Improvement on patent of October 1, 1872. A loop in the wire forming the chimney-support and sustaining the burner-cone is pushed into a socket between the edges of the cap and the screw-piece, and fastened in by a press or drop.

Claim.—The loops *a* on the wires D, in combination with sockets formed between the upper and lower parts of the lamp-cap, and contracted over the said loops, substantially as herein described, for the purpose set forth.

136,114.—*Hook.*—RICHARD WEISS, Brooklyn, N. Y.

The shank of the hook is twisted to prevent the loop from spreading when exposed to strain.

Claim.—As a new article of manufacture, a wire-hook, A, provided with a single loop, *a*, which is locked by a twist, *b*, substantially as shown and described.

136,115.—*Glove.*—EDWIN V. WHITAKER, Gloversville, N. Y.

Claim.—1. A glove, with leather palm and cloth or fabric back, having the said palm, fingers, and forgets all in one piece, except the forgets for second or middle finger, as and for the purpose described.

2. A glove-forget cut with projection *a*², *b*², or *c*², for the purpose of taking the seam out of the intersection of the fingers and thumb, as set forth.

3. The forgets *d'* and *e*¹ *e*¹, joined as shown at *f*, and having the edges *f' f'*, as and for the purpose specified.

136,116.—*Carriage-Spring.*—JOHN B. WHITCOMB, Beloit, Wis., assignor of two-thirds of his right to JOSEPH BRITTAN and ARTHUR BRITTAN, same place.

Claim.—1. The combination of the springs a e, arranged above and below the spring-bar, so as to break the concussions, substantially as set forth.

2. The clip *a*, rods *b b*, cylinder *c*, springs *i n o*, and nut *e*, when all are combined and arranged as described.

136,117.—*Rice-Cleaning Machine.*—JOHN N. WHITE, New Orleans, La., assignor of one-fourth his right to GEORGE E. SEARS, same place.

The rice and hulls, after being loosened in the huller, are delivered into a chute where they are separated, the hulls driven out through a tube by an air-blast, while the grains of rice pass directly into an agitator or worker, from which they are conveyed, respectively, to a brusher and polisher by elevators, which completes the operation of cleaning and polishing the rice.

Claim.—In combination with the huller A and chute B, having tube D and fan E, the agitator or worker C, receptacles *d d'*, brusher G H, polisher I K, and elevators *e f*, the whole being constructed and arranged substantially as described, as and for the purpose specified.

136,118.—*Fare-Box.*—JAMES F. WINCHELL, Springfield, Ohio, assignor to ELIJAH C. MIDDLETON, same place.

Between the inspection and safe chambers are pivoted an arrest-apron and a chambered lock, the two being operated conjointly by a lever hung on the shaft of the former, and moving the latter by its cam-slot.

Claim.—1. The combination and arrangement of the inspection-chamber C, safe-chamber G, segmental partition *e*, and chambered lock E F *f*, said lock being interposed between the chambers C and G, and being constructed and operated as herein described to prevent direct communication between the said chambers while the fare is passed from one to the other.

2. In combination with the cam-lever J, partition F and hinged apron D, the said lever acting directly on the partition F, and opening and closing the apron D at or near the respective ends of the oscillating movements of the partition, substantially as described.

136,119.—*Elastic Material for Boot and Shoe Gores.*—CHARLES WINSLOW, Boston, Mass.

A strip of fabric, of any desired length, is coated upon its upper surface with any suitable gum, when a sheet of vulcanized rubber, the length in its natural state being less than that of the fabric, is stretched until it covers the fabric, and pressed down upon it. A strip of non-elastic material is then affixed to the edge, so as to be flush with or a little above it, when the upper surface of the whole is again coated, and another fabric placed upon it; when the whole is again pressed together, and the rubber allowed to contract, which takes with it the fabric, and imparts to it a corrugated appearance.

Claim.—The herein-described shirred or corrugated goring, consisting of the outer and inner fabric, with the vulcanized strands or sheets of rubber between them, and the stay A, of non-elastic material, inserted between the edges of the two fabrics, substantially as specified.
